11.1 LIST OF CHEMICALS AND DATA COMPILATIONS

11.1.1 ALCOHOLS

11.1.1.1 Methanol

Common Name: Methanol

Synonym: methyl alcohol, carbinol, wood alcohol, wood spirit

CAS Registry No: 67-56-1

Molecular Formula: CH₃OH

Molecular Weight: 32.042

Melting Point (°C):

−97.53 (Lide 2003)

Boiling Point (°C):

64.6 (Lide 2003)

Density (g/cm³ at 20°C):

0.7914 (Weast 1982–83)

Molar Volume (cm³/mol):

42.5 (exptl. at normal bp, Lee et al. 1972; quoted, Reid et al. 1977)

40.6 (calculated-density, Rohrschneider 1973)

37.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

miscible (Dean 1985; Howard 1990)

miscible (Yaws et al. 1990)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

16210* (interpolated-regression of tabulated data, temp range −44.0 to 64.7°C, Stull 1947)

16937* (comparative ebulliometry, measured range 15–83.7°C, Ambrose & Sprake 1970)

log (P/Pa) = 7.18411 − 1569.492/(T/K − 34.613); restricted temp range 15–39°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

log (P/Pa) = 7.20519 − 1581.933/(T/K − 33.439); temp range 15–83.7°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

16927 (vapor-liquid equilibrium VLE data, Polák & Lu 1972)

log (P/mmHg) = [−0.2185 × 8978.8/(T/K)] + 8.639821; temp range −44 to 224°C (Antoine eq., Weast 1972–73)

16958* (static method, measured range 288.15–337.65 K, Gibbard & Creek 1974)

12260, 21330 (20°C, 30°C, Verschueren 1983)

16960 (calculated-Antoine eq., Boublik et al. 1984)

log (P/kPa) = 7.24693 − 1806.615/(241.833 + t/°C); temp range 1.72–63.38°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

log (P/kPa) = 7.20660 − 1582.698/(239.765 + t/°C); temp range 14–79.63°C (Antoine eq. from reported exptl. data of Ambrose & Sprake 1970, Boublik et al. 1984)

log (P/kPa) = 7.023029 − 1595.671/(240.905 + t/°C), temp range 15–65°C (Antoine eq. derived from exptl data of Gibbard & Creek 1974, Boublik et al. 1984)

16670 (interpolated-Antoine eq., Dean 1985)

log (P/mmHg) = 7.89750 − 1474.08/(229.13 + t/°C); temp range −14 to 65°C (Antoine eq., Dean 1985, 1992)

log (P/mmHg) = 7.97328 − 1515.14/(232.85 + t/°C); temp range 64–110°C (Antoine eq., Dean 1985, 1992)

16937 (Riddick et al. 1986)

$\log (P/\text{kPa}) = 7.20519 - 1581.993/(175.47 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log (P_L/\text{kPa}) = 7.4182 - 1710.2/(-22.25 + T/\text{K})$; temp range 175–273 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.25164 - 1608.39/(-31.07 + T/\text{K})$; temp range 274–337 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.09489 - 1521.23/(-39.18 + T/\text{K})$; temp range 338–487 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 5.86277 - 1105.884/(-64.272 + T/\text{K})$; temp range 188–228 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.44355 - 1712.316/(-22.61 + T/\text{K})$; temp range 224–290 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.26415 - 1615.59/(-30.437 + T/\text{K})$; temp range 285–345 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.14736 - 1544.804/(-37.235 + T/\text{K})$; temp range 335–376 K (Antoine eq.-VII, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.27466 - 1641.542/(-25.789 + T/\text{K})$; temp range 373–458 K (Antoine eq.-VIII, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 45.6171 - 3.2447 \times 10^3/(T/\text{K}) - 13.988 \cdot \log(T/\text{K}) + 6.6365 \times 10^{-3} \cdot (T/\text{K}) - 1.0507 \times 10^{-13} \cdot (T/\text{K})^2$;
 temp range 175–513 K (vapor pressure eq., Yaws 1994)
 35341 (40°C, vapor-liquid equilibrium VLE data, DeBord et al. 2002)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and the reported temperature dependence equations. Additional data at other temperatures designed * are compiled at the end of this section):

0.446 (partial pressure-isotenoscope, Butler et al. 1935)
 0.444 (entrainment method-GC, Burnett 1963)
 0.472 (exptl., Hine & Mookerjee 1975)
 0.367, 0.319 (calculated-group contribution, bond contribution, Hine & Mookerjee 1975)
 0.45* (headspace-GC, measured range 0–25°C, Snider & Dawson 1985)
 0.451 (limiting activity coefficient by headspace-GC., Abraham et al. 1987)
 0.704 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 0.451 (limiting activity coefficient by headspace-GC., Li & Carr 1993)
 0.620 (gas stripping-GC, Altschuh et al. 1999)
 0.506 (extrapolated-headspace GC data, measured range 40–90°C, Gupta et al. 2000)
 $\ln K_{\text{AW}} = 8.969 - 5206.8/(T/\text{K})$; temp range 40–90°C (van't Hoff eq., headspace GC, Gupta et al. 2000)
 0.334 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 3.444 - 2142/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)
 1.239* (40°C, headspace-GC, measured range 40–65°C, Teja et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

-0.82 (shake flask-CR, Collander 1951)
 -0.66 (shake flask-GC, Hansch & Anderson 1967)
 -0.77 ± 0.02 (shake flask-GC, Leo et al. 1975; Hansch & Leo 1979; Hansch & Leo 1985)
 -0.52 (shake flask-RC, Cornford 1982)
 -0.70 (shake flask, OECD 1981 Guidelines, Geyer et al. 1984)
 -0.64, -0.63 (quoted, calculated-TSA, Iwase et al. 1985)
 -0.71 (shake flask-GC at pH 7.0, Riebesehl & Tomlinson 1986)
 -0.74 (recommended, Sangster 1989, 1993)
 -0.77 (recommended value, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ as 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

2.98* (20.29°C, from GC determined γ° in octanol, measured range 20.29–50.28°C, Gruber et al. 1997)
 2.84 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, log BCF:

4.45	(alga <i>Chlorella fusca</i> , wet wt. basis, Geyer et al. 1984)
4.45	(alga <i>Chlorella fusca</i> , calculated- K_{OW} , Geyer et al. 1984)
< 1.0	(golden ide, after 3 d, Freitag et al. 1985)
4.46	(algae, after 1 d, Freitag et al. 1985)
2.67	(activated sludge, after 5 d, Freitag et al. 1985)

Sorption Partition Coefficient, log K_{OC} :

-0.23	(calculated-MCI χ , Gerstl & Helling 1987)
0.44	(soil, quoted exptl., Meylan et al. 1992)
-0.36	(soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
-1.08	(calculated- K_{OW} , Kollig 1993)
0.44	(soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} \sim 5.3$ h and 2.6 d for a model river 1-m deep and an environmental pond (Lyman et al. 1982; selected, Howard 1990).

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} ; for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{OH} = (5.7 \pm 0.6) \times 10^8 \text{ L mol}^{-1} \text{ s}^{-1}$ or $9.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 292 K (relative rate method, Campbell et al. 1976)

$k_{OH} = (1.06 \pm 0.10) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K (Overend & Paraskevopoulos 1978; quoted, Atkinson 1985)

$k_{OH} = (1.00 \pm 0.10) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-resonance fluorescence, Ravishankara & Davis 1978)

$k_{OH} = 5.7 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 K (Lyman et al. 1982)

$k \sim 0.024 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with O_3 in water at pH 2-5 and 20-23°C (Hoigné & Bader 1983)

$k_{OH} = 0.76 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K in air (Meier et al. 1985; quoted, Atkinson 1985)

$k_{OH}(\text{calc}) = 6.5 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 9.0 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH} = 0.80 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Zellner & Lorenz 1984; quoted, Carlier et al. 1986)

$k_{OH}(\text{exptl}) = 0.90 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 0.53 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (8.61 \pm 0.47) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240-440 K (flash photolysis-resonance fluorescence, Wallington & Kurylo 1987a)

$k_{NO_3} < 6.0 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 ± 2 K (flash photolysis-absorption technique (Wallington et al. 1987; selected, Atkinson 1991)

$k(\text{aq.}) = 1.60 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with OH radical in aqueous solution (Wallington & Kurylo 1987b)

$k_{OH}(\text{exptl})^* = 8.61 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240-440 (flash photolysis-resonance fluorescence, Wallington et al. 1988a)

$k_{OH} = 8.61 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 1.60 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{OH}^* = 9.32 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

$k_{OH} = (9.0 \pm 0.9) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{OH} = (1.0 \pm 0.23) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at 298 ± 2 K (Nelson et al. 1990)

$k_{OH}(\text{calc}) = 4.05 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation: $t_{1/2}(\text{aerobic}) = 1$ d, $t_{1/2}(\text{anaerobic}) = 1$ d in natural waters (Capel & Larson 1995)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} > 9.9$ d for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

estimated $t_{1/2} = 17.8$ d in ambient atmosphere (Howard 1990);

atmospheric transformation lifetime was estimated to be 1 to 5 d (Kelly et al. 1994);

calculated lifetimes of 12 d and 1.0 yr for reactions with OH radical, NO₃ radical, respectively (Atkinson 2000).

Surface water: $t_{1/2}$ (aerobic) = 1 d, $t_{1/2}$ (anaerobic) = 1 d in natural waters (Capel & Larson 1995)

Groundwater:

Sediment:

Soil:

Biota:

TABLE 11.1.1.1.1

Reported vapor pressures of methanol at various temperatures and the coefficients for the vapor pressure equations

log P = A – B/(T/K)		(1)	ln P = A – B/(T/K)		(1a)

11.1.1.2 Ethanol

Common Name: Ethanol

Synonym: ethyl alcohol, methylcarbinol

Chemical Name: ethanol, ethyl alcohol

CAS Registry No: 64-17-5

Molecular Formula: $\text{CH}_3\text{CH}_2\text{OH}$

Molecular Weight: 46.068

Melting Point ($^{\circ}\text{C}$):

-114.14 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

78.29 (Lide 2003)

Density (g/cm^3 at 20°C):

0.78933, 0.78505 (20°C , 25°C , Dreisbach & Martin 1949)

0.7893 (Weast 1982–83)

Molar Volume (cm^3/mol):

58.6 (calculated-density, Rohrschneider 1973)

59.2 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

15.9 (Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.02 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C):

miscible (Dean 1985)

miscible (Riddick et al. 1986)

miscible (Yaws et al. 1990)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

7314, 7581* (24.4 , 24.8°C , measured range 12.80 – 78.0°C , Kahlbaum 1883)

6906* (22.7°C , static method, measured range 22.7 – 78°C , Smyth & Engel 1929)

7599 (gas saturation/air-bubbling method, Washburn & Handorf 1935)

39345* (vapor-liquid equilibrium VLE data, measured range 35 – 60°C , Scatchard & Raymond 1938)

7538* (interpolated-regression tabulated data, temp range -31.3 to 78.4°C , Stull 1947)

1593, 7869, 29456 (0 , 25 , 50°C , static method, vapor-liquid equilibrium VLE data, Kretschmer et al. 1948)

7869* (static method, measured range 0 – 78.553°C , Kretschmer & Wiebe 1949)

$\log(P/\text{mmHg}) = 8.11576 - 1595.76/(t/^{\circ}\text{C} + 226.5)$; temp range 0 – 78.553°C , Kretschmer & Wiebe 1949)

$\log(P/\text{mmHg}) = 8.24169 - 1652.6/(230 + t/^{\circ}\text{C})$ (Antoine eq., Dreisbach & Martin 1949)

7870* (comparative ebulliometry, measured range 19.622 – 93.5°C , Ambrose & Sprake 1970)

$\log(P/\text{Pa}) = 7.16879 - 1552.601/(T/\text{K} - 50.731)$; restricted temp range 19.6 – 43.2°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

$\log(P/\text{Pa}) = 7.24739 - 1599.039/(T/\text{K} - 46.391)$; temp range 19.6 – 93.5°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

7865 (vapor-liquid equilibrium VLE data, Polák & Lu 1972)

$\log(P/\text{mmHg}) = [-0.2185 \times 9673.6/(T/\text{K})] + 8.827392$; temp range -31.3 – 242°C (Antoine eq., Weast 1972–73)

5852, 6665, 9998 (20 , 25 , 30°C , Verschuereen 1983)

8060 (calculated-Antoine eq., Boublik et al. 1984)

- $\log (P/\text{kPa}) = 7.24222 - 1595.811/(226.448 + t/^{\circ}\text{C})$; temp range 19.62–93.48°C (Antoine eq. from reported exptl. data of Ambrose & Sprake 1970, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 4.11678 - 323.237/(74.916 + t/^{\circ}\text{C})$; temp range 12.8–78.2°C (Antoine eq. from reported exptl. data of Kahlbaum 1883, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 7.31243 - 1630.868/(229.581 + t/^{\circ}\text{C})$; temp range 0–78.55°C (Antoine eq. from reported exptl. data of Kretschmer & Wiebe 1949, Boublik et al. 1984)
 7968 (calculated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 8.32109 - 1718.10/(237.52 + t/^{\circ}\text{C})$; temp range –2 to 100°C (Antoine eq., Dean 1985, 1992)
 7870 (Riddick et al. 1986)
 $\log (P/\text{kPa}) = 7.16879 - 1552.601/(222.419 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log (P_L/\text{kPa}) = 7.15946 - 1547.464/(-51.177 + T/\text{K})$; temp range 320–359 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.23347 - 1591.28/(-47.056 + T/\text{K})$, temp range: 292–367 K, (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 8.9391 - 2381.5/(T/\text{K})$; temp range 210–271 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 8.5224 - 2299/(T/\text{K})$; temp range 193–223 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.16386 - 1550.006/(-50.941 + T/\text{K})$; temp range 320–359 K, (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.27664 - 1615.127/(-45.012 + T/\text{K})$; temp range 292–353 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.95131 - 1423.668/(-63.568 + T/\text{K})$; temp range 349–374 K (Antoine eq.-VII, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 23.8442 - 2.8642 \times 10^3/(T/\text{K}) - 5.0474 \cdot \log(T/\text{K}) + 3.7448 \times 10^{-11} \cdot (T/\text{K}) + 2.7361 \times 10^{-5} \cdot (T/\text{K})^2$;
 temp range 159–516 K (vapor pressure eq., Yaws 1994)
 17819 (40°C, vapor-liquid equilibrium VLE data, DeBord et al. 2002)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.520 (partial pressure-isoteniscope, Butler et al. 1935)
 0.0118 (partial vapor pressure, concn.-GC, Burnett & Swoboda 1962)
 0.4660 (entrainment method-GC, Burnett 1963)
 0.637 (exptl.-calculated C_w/C_A , Hine & Mookerjee 1975)
 0.495, 0.472 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 0.527* (headspace-GC, measured range 0–25°C, Snider & Dawson 1985)
 0.530 (limiting activity coefficient by headspace-GC., Abraham et al. 1987)
 0.637 (calculated-MCI χ , Nirmalakhandan & Speece 1988)
 0.823 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 0.70 (correlated-molecular structure, Russell et al. 1992)
 0.542 (limiting activity coefficient by headspace-GC., Li & Carr 1993)
 0.593 (solid-phase microextraction SPME-GC, Bartelt 1997)
 0.744 (gas stripping-GC, Altschuh et al. 1999)
 0.568 (extrapolated-headspace GC data, measured range 40–90°C, Gupta et al. 2000)
 $\ln K_{AW} = 10.173 - 5531.6/(T/\text{K})$; temp range 40–90°C (van't Hoff eq., headspace GC, Gupta et al. 2000)
 0.361 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 5.576 - 2757/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 0.32 (shake flask-CR, Collander 1951)
 –0.16 (Leo et al. 1969; Hansch & Dunn III 1972)
 –0.30 (shake flask-GC, Dillingham et al. 1973)
 –0.31 ± 0.02 (shake flask-GC, Leo et al. 1975; Hansch & Leo 1979; Hansch & Leo 1985)

 –0.18 (shake flask-RC, Cornford 1982)

-0.20	(shake flask-GC at pH 7, Riebesehl & Tomlinson 1986)
-0.30	(recommended, Sangster 1989, 1993)
-0.25	(thermometric titration, Fujiwara et al. 1991)
-0.29	(calculated-activity coeff. γ from UNIFAC, Dallos et al. 1993)
-0.31, -0.22	(recommended value; value at pH 7.2, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

3.34*	(20.29°C, from GC determined γ° in octanol, measured range 20.29–50.28°C, Gruber et al. 1997)
3.20	(head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

-1.63	(calculated as per Mackay 1982, Schultz et al. 1990)
-------	--

Sorption Partition Coefficient, $\log K_{OC}$:

0.09	(calculated- MCI χ , Gerstl & Helling 1987)
0.20	(soil, exptl., Meylan et al. 1992)
-0.14	(soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
0.20	(soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} \sim 6$ d from water (estimated, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k = 0.01 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 8 \times 10^5$ d (Howard 1972; Hendry et al. 1974; quoted, Mill 1982)

photooxidation $t_{1/2} = 0.24\text{--}2.4$ h based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{OH} = (1.8 \pm 0.2) \times 10^9 \text{ L mol}^{-1} \text{ s}^{-1}$ or $3.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 292 K (relative rate method, Campbell et al. 1976)

$k = < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen in aquatic systems at 25°C with $t_{1/2} > 100$ yr (Foote 1976; Mill 1979; Mill 1982)

$k_{OH} = 2 \times 10^9 \text{ L mol}^{-1} \text{ s}^{-1}$ at 25°C in the atmosphere with $t_{1/2} = 2.8$ d (Hendry & Kenley 1979)

$k_{OH} = (3.74 \pm 0.37) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K (Overend & Paraskevopoulos 1978)

$k_{OH} = 1.8 \times 10^{12} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 300 K (Lyman et al. 1982)

$k_{OH} = (2.62 \pm 0.36) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-resonance fluorescence, Ravishankara & Davis 1978)

$k_{OH} = 1.75 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Meier et al. 1985)

$k(aq.) = (0.37 \pm 0.04) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with O_3 in water at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{OH} = 2.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Zellner & Lorenz 1984; quoted, Carlier et al. 1986)

$k_{OH}(calc) = 3.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(obs.) = 2.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}(exptl) = 2.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(calc) = 3.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (33.3 \pm 2.3) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240–440 K (flash photolysis-resonance fluorescence, Wallington & Kurylo 1987a)

$k_{NO_3} < 9.0 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 ± 2 K (flash photolysis-absorption technique, Wallington et al. 1987; quoted, Atkinson 1991)

$k_{OH}^* = 3.33 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240–440 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a)

$k_{OH} = 3.33 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k(soln) = 3.20 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{\text{OH}}^* = 3.27 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

$k_{\text{OH}} = (3.04 \pm 0.25) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{\text{OH}} = (3.46 \pm 0.52) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at $298 \pm 2 \text{ K}$ (Nelson et al. 1990)

$k(\text{aq.}) = 0.51 \text{ M}^{-1} \text{ s}^{-1}$ at pH 7.2, $k = 0.72 \text{ M}^{-1} \text{ s}^{-1}$ at pH 7.3, and $k = 0.77 \text{ M}^{-1} \text{ s}^{-1}$ at pH 8.1 for direct reaction with ozone in water at 21°C with $t_{1/2} = 18 \text{ h}$ at pH 7 (Yao & Haag 1991)

$k_{\text{OH}}(\text{calc}) = 5.16 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation:

$t_{1/2}(\text{aq. aerobic}) = 24\text{--}168 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation screening test data (Heukelekian & Rand 1955; Malaney & Gerhold 1969; selected, Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 96\text{--}672 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$k = 0.043\text{--}0.055 \text{ h}^{-1}$ in 30 mg/L activated sludge after a time lag of 5–10 h (Urano & Kato 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ in air for the gas-phase reaction with hydroxyl radical, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976);

$t_{1/2} \sim 5.9 \text{ d}$ to 4.0 d estimated in the atmosphere (Graedel 1978; quoted, Howard 1990), based on the reaction with a OH radical concentration of $8 \times 10^5 \text{ molecules/cm}^3$ (Campbell 1976; Lyman et al. 1982; quoted, Howard 1990);

photooxidation $t_{1/2} = 12.2\text{--}122 \text{ h}$, based on measured rate constant for the reaction with OH radical in air (Atkinson 1987; selected, Howard et al. 1991);

calculated lifetimes of 3.5 d and 26 d for reactions with OH radical, NO_3 radical, respectively (Atkinson 2000).

Surface water: photooxidation $t_{1/2} = 334 \text{ d}$ –36.6 yr, based on measured rate constant for the reaction with hydroxyl radical in water (Anbar & Neta 1967; selected, Howard et al. 1991); measured rate constants of $0.51 \text{ M}^{-1} \text{ s}^{-1}$, $0.72 \text{ M}^{-1} \text{ s}^{-1}$, $0.77 \text{ M}^{-1} \text{ s}^{-1}$, at pH 7.2, 7.3, 8.1, respectively, for direct reaction with ozone in water at 21°C , with $t_{1/2} = 18 \text{ h}$ at pH 7 (Yao & Haag 1991).

Groundwater: $t_{1/2} = 48\text{--}336 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota

TABLE 11.1.1.2.1

Reported vapor pressures of ethanol at various temperatures and the coefficients for the vapor pressure equations

$$\log P = A - B/(T/K) \quad (1) \quad \ln P = A - B/(T/K) \quad (1a)$$

$$\log P = A - B/(C + t/^\circ\text{C}) \quad (2) \quad \ln P = A - B/(C + t/^\circ\text{C}) \quad (2a)$$

$$\log P = A - B/(C + T/K) \quad (3)$$

$$\log P = A - B/(T/K) - C \cdot \log(T/K) \quad (4)$$

FIGURE 11.1.1.2.3 Logarithm of K_{OA} versus reciprocal temperature for ethanol.

11.1.1.3 Propanol (*n*-Propyl alcohol)

Common Name: Propanol

Synonym: propyl alcohol, 1-propanol, *n*-propyl alcohol

Chemical Name: propanol, propyl alcohol, *n*-propyl alcohol

CAS Registry No: 71-23-8

Molecular Formula: C₃H₈O, CH₃CH₂CH₂OH

Molecular Weight: 60.095

Melting Point (°C):

−124.39 (Lide 2003)

Boiling Point (°C):

97.2 (Lide 2003)

Density (g/cm³ at 20°C):

0.8035 (Weast 1982–83)

0.8037 (Dean 1985)

Molar Volume (cm³/mol):

75.1 (calculated-density, Rohrschneider 1973)

81.4 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK:

19.4 (pK_s, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.372 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

> 3.1 × 10⁶ (Booth & Everson 1948)

miscible (Dean 1985; Riddick et al. 1986, Yaws et al. 1990))

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2844 (saturated vapor density-gas saturation, Puck & Wise 1946)

2594* (interpolated-regression of tabulated data, temp range −15 to 97.8°C, Stull 1947)

10990* (48.14°C, measured range 48.14–97.1°C, Brown & Smith 1959)

2720* (ebulliometry-differential thermal analysis, measured range 19.3–97.3°C, Kemme & Kreps 1969)

log (P/mmHg) = 8.18894 − 1690.864/(221.346 + t/°C); temp range 19.3–97.3°C, or pressure range 14.7–758.5 mmHg (Antoine eq., ebulliometry-differential thermal analysis, Kemme & Kreps 1969)

2798* (comparative ebulliometry, measured range 60.2–104.5°C, Ambrose & Sprake 1970)

log (P/Pa) = 6.74390 − 1365.579/(T/K − 82.093); restricted temp range 60.2–81.2°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

log (P/Pa) = 6.87613 − 1441.705/(T/K − 74.291); temp range 60.2–104.5°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

log (P/mmHg) = [−0.2185 × 10421.1/(T/K)] + 8.937293; temp range −15 to 250°C (Antoine eq., Weast 1972–73)

2744 (extrapolated-Antoine eq., Boublik et al. 1984)

log (P/kPa) = 6.97878 − 1497.734/(204.094 + t/°C); temp range 48.14–94.36°C (Antoine eq. from reported exptl. data of Brown & Smith 1959, Boublik et al. 1984)

log (P/kPa) = 6.87065 − 1438.587/(198.552 + t/°C); temp range 60.2–104.6°C (Antoine eq. from reported exptl. data of Ambrose & Sprake 1970, Boublik et al. 1984)

2780 (interpolated-Antoine eq., Dean 1985)

log (P/mmHg) = 7.84767 − 1499.21/(204.64 + t/°C); temp range 2–120°C (Antoine eq., Dean 1985, 1992)

2798 (Riddick et al. 1986)

log (P/kPa) = 6.87613 − 1441.705/(198.859 + t/°C), temp range not specified (Antoine eq., Riddick et al. 1986)

- $\log (P_L/\text{kPa}) = 6.86874 - 1437.906/(-74.621 + T/\text{K})$; temp range 333–378 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.74195 - 1364.911/(-82.114 + T/\text{K})$; temp range 356–378 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 8.7592 - 2506/(T/\text{K})$; temp range 200–228 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.74403 - 1366.08/(-81.994 + T/\text{K})$; temp range 356–376 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.87377 - 1440.743/(-74.344 + T/\text{K})$; temp range 333–376 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.58415 - 1273.365/(-92.178 + T/\text{K})$; temp range 369–407 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 31.5155 - 3.457 \times 10^3/(T/\text{K}) - 7.5235 \cdot \log (T/\text{K}) - 4.287 \times 10^{-11} \cdot (T/\text{K}) + 1.3029 \times 10^{-7} \cdot (T/\text{K})^2$;
 temp range 124–537 K (vapor pressure eq., Yaws 1994)
 6939 (40°C, vapor-liquid equilibrium VLE data, DeBord et al. 2002)
 9470 (45.43°C, vapor-liquid equilibrium VLE data, measured range 45.43–58.9°C, Pasanen et al. 2004)
 5876 (37.02°C, ebulliometric method, measured range 310.17–356.7 K, Lubomska & Malanowski 2004)
 $\log (P/\text{kPa}) = 7.219284 - 1629.492/[(T/\text{K}) - 57.556]$; temp range 310.17–356.7 K (Antoine eq., ebulliometric method, Lubomska & Malanowski 2004)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.694 (measured partial pressure/mole fraction x at dilute concn, Butler et al. 1935)
 0.620 (entrainment method-GC, Burnett 1963)
 0.683 (exptl., Hine & Mookerjee 1975)
 0.699; 0.710 (calculated-group contribution; calculated-bond contribution, Hine & Mookerjee 1975)
 0.751* (headspace-GC, measured range 0–25°C, Snider & Dawson 1985)
 0.683 (limiting activity coefficient by headspace-GC., Abraham et al. 1987)
 0.925 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 0.683, 0.942 (quoted, correlated-molecular structure, Russell et al. 1992)
 0.715 (limiting activity coefficient by headspace-GC., Li & Carr 1993)
 1.034 (solid-phase microextraction SPME-GC, Bartelt 1997)
 0.372 (wetted-wall column-GC, Altschuh et al. 1999)
 0.802 (extrapolated-headspace GC data, measured range 40–90°C, Gupta et al. 2000)
 $\ln K_{\text{AW}} = 11.830 - 5923.2/(T/\text{K})$; temp range 40–90°C (van't Hoff eq., headspace GC, Gupta et al. 2000)
 0.490 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 6.955 - 3123/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 0.34 (shake flask-GC, Hansch & Anderson 1967)
 0.30 (shake flask-GC, Dillingham et al. 1973)
 0.25 ± 0.01 (shake flask-GC, Leo et al. 1975)
 0.29 (Hansch & Leo 1979)
 0.32 (shake flask-GC at pH 7, Riebesehl & Tomlinson 1986)
 0.25 (recommended, Sangster 1989)
 0.25 (recommended value, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 3.85* (20.29°C, from GC determined γ^∞ in octanol, measured range 20.29–50.28°C, Gruber et al. 1997)
 3.20 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

- 1.069 (calculated as per Mackay 1982, Schultz et al. 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

0.37	(calculated-MCI χ , Gerstl & Helling 1987)
0.48	(soil, quoted exptl., Meylan et al. 1992)
0.12	(soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
0.48	(soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated * data at other temperatures and/or the Arrhenius expression see reference:

photooxidation $t_{1/2} = 0.24\text{--}2.4$ h for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{OH} = (2.3 \pm 0.2) \times 10^9 \text{ L mol}^{-1} \text{ s}^{-1}$ at 292 K (relative rate method, Campbell et al. 1976)

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for the oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100$ yr (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{OH} = 2 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C with $t_{1/2} = 2.8$ d (Hendry & Kenley 1979; quoted, Mill 1982)

$k_{OH} = (5.33 \pm 0.53) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K (Overend & Paraskevopoulos 1978; quoted, Atkinson 1985)

$k = (0.37 \pm 0.04) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{OH}(\text{calc}) = 5.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 5.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH}(\text{exptl}) = 5.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 5.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH} = (5.34 \pm 0.29) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (flash photolysis-resonance fluorescence, Wallington & Kurylo 1987a)

$k_{OH} = 5.34 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 4.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for solution-phase reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{OH}^* = 5.34 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ 298 K (recommended, Atkinson 1989, 1990)

$k_{OH} = (5.64 \pm 0.48) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{OH} = (5.50 \pm 0.44) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at 298 ± 2 K (Nelson et al. 1990)

$k_{OH}(\text{calc}) = 6.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation: average rate of biodegradation $71.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.24\text{--}2.4$ h for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976).

11.1.1.4 Isopropanol (*i*-Propyl alcohol)

Common Name: Isopropanol

Synonym: isopropyl alcohol, 2-propanol, *i*-propyl alcohol, dimethylcarbinol, *sec*-propylalcohol, perspirit, petrohol, avantine, IPA

Chemical Name: isopropanol, isopropyl alcohol, *i*-propyl alcohol

CAS Registry No: 67-63-0

Molecular Formula: C_3H_8O , $CH_3(CH_3)CHOH$

Molecular Weight: 60.095

Melting Point ($^{\circ}C$):

−87.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

82.3 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.7812 ($25^{\circ}C$, Butler et al. 1935)

0.7855 (Weast 1982–83; Dean 1985)

Molar Volume (cm^3/mol):

76.8 (calculated-density, Rohrschneider 1973)

81.4 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

17.1 (Serjeant & Dempsey 1979; Howard 1990)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.406 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

$> 3.1 \times 10^6$ (Booth & Everson 1948)

miscible (Dean 1985; Riddick et al. 1986; Howard 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

5866* (static method-isoteniscope, measured 0 – $90^{\circ}C$, Parks & Barton 1928)

5700* (interpolated-regression of tabulated data, temp range -26.1 to $82.5^{\circ}C$, Stull 1947)

5775* (comparative ebulliometry, measured range 52.323 – $89.261^{\circ}C$, Ambrose & Sprake 1970)

$\log(P/Pa) = 6.73896 - 1290.345/(T/K - 82.778)$; restricted temp range 52.3 – $71.1^{\circ}C$ (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

$\log(P/Pa) = 6.86618 - 1360.131/(T/K - 75.558)$; temp range 52.3 – $89.3^{\circ}C$ (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

$\log(P/mmHg) = [-0.2185 \times 10063.5/(T/K)] + 7.805751$; temp range -91 to $160^{\circ}C$ (Antoine eq., Weast 1972–73) 4266, 7588 ($20^{\circ}C$, $30^{\circ}C$, Verschuereen 1983)

5070; 5700 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.86634 - 1360.183/(197.593 + t/^{\circ}C)$; temp range 52.3 – $89.26^{\circ}C$ (Antoine eq. from reported exptl. data of Ambrose & Sprake 1970, Boublik et al. 1984)

$\log(P/kPa) = 6.358 - 1082.462/(166.482 + t/^{\circ}C)$; temp range 81.61 – $147.6^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

6021 (calculated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 8.11778 - 1580.92/(219.61 + t/^{\circ}C)$; temp range 0 – $101^{\circ}C$ (Antoine eq., Dean 1985, 1992)

5775 (Riddick et al. 1986)

$\log(P/kPa) = 6.86618 - 1360.131/(126.36 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

$\log (P_L/\text{kPa}) = 6.86087 - 1357.514/(-75.786 + T/\text{K})$; temp range 325–363 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.72348 - 1282.26/(-83.591 + T/\text{K})$; temp range 347–363 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 9.681 - 2626/(T/\text{K})$; temp range 195–228 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.73782 - 1290.039/(-82.771 + T/\text{K})$; temp range 347–363 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.86451 - 1359.473/(-75.592 + T/\text{K})$; temp range 325–363 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.61939 - 1225.439/(-89.774 + T/\text{K})$; temp range 350–383 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 38.2363 - 3.5513 \times 10^3/(T/\text{K}) - 10.031 \cdot \log(T/\text{K}) - 3.474 \times 10^{-10} \cdot (T/\text{K}) + 1.7367 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 185–508 K (vapor pressure eq., Yaws 1994)
 13806 (40°C, vapor-liquid equilibrium VLE data, DeBord et al. 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.814 (measured partial pressure/mole fraction x at dilute concn, Butler et al. 1935)
 0.820 (exptl., Hine & Mookerjee 1975)
 1.159, 0.710 (calculated-group contribution, calculated-bond contribution; Hine & Mookerjee 1975)
 0.80* (headspace-GC, measured range 0–25°C, Snider & Dawson 1985)
 1.131 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 3.16* (40°C, equilibrium headspace-GC, measured range 40–80°C, Kolb et al. 1992)
 $\ln (1/K_{AW}) = -10.6 + 5413/(T/\text{K})$; temp range 40–80°C (equilibrium headspace-GC measurements, Kolb et al. 1992)
 0.820, 0.715 (quoted, correlated-molecular structure, Russell et al. 1992)
 1.091 (gas stripping-GC, Altschuh et al. 1999)
 5.55 (EPICS-GC, Ayuttaya et al. 2001)
 0.521 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 5.576 - 2757/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)
 2.186 – 0.666 (27°C, equilibrium headspace-GC, solute concn 12.31–125.08 mg/L, measured range 300–315 K, Cheng et al. 2003)
 2.186* (27°C, equilibrium headspace-GC, measured range 27–42°C, Cheng et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.14 (Leo et al. 1969; Hansch & Dunn III 1972)
 0.05 (shake flask-GC, Dillingham et al. 1973)
 0.05 (Hansch & Leo 1985)
 0.14 (HPLC- k' correlation, Funasaki et al. 1986)
 0.55 (UNIFAC activity coefficient, Banerjee & Howard 1988)
 0.05 (recommended, Sangster 1989, 1993)
 0.05 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

3.54* (20.29°C, from GC determined γ^∞ in octanol, measured range 20.29–50.28°C, Gruber et al. 1997)
 3.38 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: the estimated $t_{1/2} \sim 3.6$ d for evaporation from water 1 m deep with 1 m/s current and 3 m/s wind (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

photooxidation $t_{1/2} = 197$ d to 22 yr in water, based on measured rate constant for the reaction with OH radical in water (Dorfman & Adams 1973; selected, Howard et al. 1991)

photooxidation $t_{1/2} = 0.24\text{--}2.4$ h in air for the gas-phase reaction with OH radical, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100$ yr (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{OH} = 4.1 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C with $t_{1/2} = 1.3$ d (Hendry & Kenley 1979; quoted, Mill 1982)

$k_{OH} = (5.48 \pm 0.55) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $(296 \pm 2) \text{ K}$ (Overend & Paraskevopoulos 1978; quoted, Atkinson 1985)

$k_{OH} = 4.3 \times 10^{12} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 300 K (Lyman et al. 1982)

$k = (1.9 \pm 0.2) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2-6 and 20-23°C (Hoigné & Bader 1983)

$k_{OH}(\text{calc}) = 7.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 6.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH}(\text{exptl}) = 6.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{OH}(\text{calc}) = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (5.81 \pm 0.34) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240-440 K (flash photolysis-resonance fluorescence, Wallington & Kurylo 1987a)

$k_{NO_3} < 2.3 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (flash photolysis-absorption technique, Wallington et al. 1987; quoted, Atkinson 1991)

$k(\text{aq.}) = 3.20 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with OH radical in aqueous solution (Wallington & Kurylo 1987b)

$k_{OH}(\text{exptl})^* = 5.81 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240-440 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a)

$k_{OH} = 5.81 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 3.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{OH}^* = 5.21 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

$k_{OH} = (5.69 \pm 1.09) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{OH} = (5.78 \pm 0.753) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at $298 \pm 2 \text{ K}$ (Nelson et al. 1990)

$k_{OH}(\text{calc}) = 2.90 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation:

$k = 52.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$, average rate of biodegradation based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

$t_{1/2}$ (aq. aerobic) = 24-168 h, based on unacclimated aerobic aqueous screening test data (Gellman & Heukelekian 1955; Heukelekian & Rand 1955; Price et al. 1974; Takemoto et al. 1981; Wagner 1976; selected, Howard et al. 1991);

$t_{1/2}$ (aq. anaerobic) = 96-672 h, based on estimated aerobic aqueous biodegradation half-life and unacclimated anaerobic aqueous screening test data (Hou et al. 1983; Sonoda & Seiko 1968; Speece 1983; selected, Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 0.24\text{--}2.4$ h in air for the gas-phase reaction with hydroxyl radical, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photooxidation $t_{1/2} = 6.2\text{--}72$ h, based on measured rate constant for the reaction with hydroxyl radical in air (Atkinson 1985, 1987; quoted, Howard 1990; selected, Howard et al. 1991).

Surface water: photooxidation $t_{1/2} = 197$ d to 22 yr, based on measured rate constant for the reaction with hydroxyl radical in water (Dorfman & Adams 1973; selected, Howard et al. 1991);

$t_{1/2} = 26$ –168 h, based on estimated unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 48$ –336 h, based on estimated unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24$ –168 h, based on estimated unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991).

Biota:

FIGURE 11.1.1.4.3 Logarithm of K_{OA} versus reciprocal temperature for isopropanol.

11.1.1.5 *n*-Butanol (*n*-Butyl alcohol)Common Name: *n*-ButanolSynonym: 1-butanol, *n*-butyl alcohol, *n*-propylcarbinolChemical Name: *n*-butyl alcohol, 1-butanol

CAS Registry No: 71-36-3

Molecular Formula: C₄H₁₀O, CH₃CH₂CH₂CH₂OH

Molecular Weight: 74.121

Melting Point (°C):

-88.6 (Dean 1985; Riddick et al. 1986; Lide 2003)

Boiling Point (°C):

117.73 (Lide 2003)

Density (g/cm³ at 20°C):

0.80593 (25°C, Butler et al. 1935)

0.80980 (Weast 1982–83)

0.80956, 0.80575 (20°C, 25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

91.7 (calculated-density, Rohrschneider 1973)

103.6 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a:

20.89 (Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

9.37 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

56 (estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

68120, 79000* (18, 20°C, shake flask-turbidity, Fühner 1924)

73500* (volumetric method, Hill & Malisoff 1926)

64000* (20°C, synthetic method, Jones 1929)

70800* (30°C, vapor liquid equilibrium, measured range 0–105°C, Mueller et al. 1931)

74500 (gravimetric method, Stockhart & Hull 1931)

73180 (24.85°C, shake flask-interferometer, Butler et al. 1933)

73100 (shake flask-cloud point, Butler et al. 1933)

70000 (26°C, synthetic method, Othmer et al. 1945)

73320 (shake flask-residue volume, Booth & Everson 1948)

74100 (shake flask-interferometry, Hansen et al. 1949)

73000 (shake flask-interferometry, quoted from Butler et al. 1933, Donahue & Bartell 1952)

75850 (estimated, McGowan 1954)

78700 (26.7°C, shake flask-turbidity, Skrzec & Murphy 1954)

74000 (surface tension, Kinoshita et al. 1958)

70000 (titration, Petriris & Geankopolis 1959)

75600* (20°C, synthetic method, measured range 0–125°C, von Erichsen 1962)

77800 (shake flask-GC, Korenman et al. 1974, 1975)

74000* (shake flask-colorimetric analysis, De Santis et al. 1976)

70000* (29.8°C, shake flask-refractometry, measured range 29.8–124.6°C, Aoki & Moriyoshi 1978)

63300 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)

77000 (Verschuereen 1983; Howard 1990)

74000* (recommended, IUPAC solubility series, temp range 10–110°C, Barton 1984)

74500 (selected, Riddick et al. 1986)

80300*	(20°C, shake flask-GC/TC, measured range 0–90.8°C, Stephenson & Stuart 1986)
74600	(selected, Yaws et al. 1990)
65720	(shake flask-GC, Li et al. 1992)
71230	(shake flask-GC, Li & Andren 1994)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

800*	(24.0°C, static method, measured range 15.1–117.6°C, Kahlbaum 1898)
904*	(24.98°C, modified isoteniscope method, measured range 24.98–101.16°C, Butler et al. 1935)
$\log (P/\text{mmHg}) = 40.2105 - 4100/(T/K) - 10.35 \cdot \log (T/K)$; temp range 25–110°C (isoteniscope measurements, Butler et al. 1935)	
819	(saturated vapor density-gas saturation, Puck & Wise 1946)
667*	(20°C, summary of literature data, temp range –1.20 to 117°C, Stull 1947)
$\log (P/\text{mmHg}) = 8.27488 - 1873.9/(230 + t/^\circ\text{C})$ (Antoine eq., Dreisbach & Martin 1949)	
10274*	(64.56°C, measured range 64.56–117.56°C, Brown & Smith 1959)
820	(calculated-Antoine eq., Reid & Sherwood 1966)
733*	(22.6°C, ebulliometry-differential thermal analysis, measured range 22.6–117.8°C, Kemme & Kreps 1969)
$\log (P/\text{mmHg}) = 7.42117 - 1351.555/(179.810 + t/^\circ\text{C})$; temp range 22.6–117.8°C, or pressure range 5.5–766 mmHg (Antoine eq., ebulliometry-differential thermal analysis, Kemme & Kreps 1969)	
910*	(comparative ebulliometry, measured range 78.558–125.686°C, Ambrose & Sprake 1970)
$\log (P/\text{Pa}) = 6.41435 - 1262.767/(T/K - 104.445)$; restricted temp range 78.558–100.74°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)	
$\log (P/\text{Pa}) = 6.54743 - 1338.769/(T/K - 96.108)$; temp range 78.558–125.686°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)	
864	(Hoy 1970)
948*	(298.11 K, measured range 283.10–323.12 K, Geiseler et al. 1973)
$\log (P/\text{mmHg}) = [-0.2185 \times 10970.5/(T/K)] + 8.929597$; temp range –1.2 to 277°C (Antoine eq., Weast 1972–73)	
868*	(24.96°C, vapor-liquid equilibrium data, temp range 281.1–323.12 K, Gmehling et al. 1982)
586, 1333	(20°C, 30°C, quoted, Verschueren 1983)
890	(interpolated-Antoine eq., Boublik et al. 1984)
$\log (P/\text{kPa}) = 6.54068 - 1335.018/(176.654 + t/^\circ\text{C})$; temp range 78.56–125.7°C (Antoine eq. from reported exptl. data of Ambrose & Sprake 1970, Boublik et al. 1984)	
$\log (P/\text{kPa}) = 6.71950 - 1428.939/(185.552 + t/^\circ\text{C})$; temp range 41.5–108.8°C (Antoine eq. from reported exptl. data Kahlbaum 1898, Boublik et al. 1984)	
$\log (P/\text{kPa}) = 6.66896 - 1405.473/(183.866 + t/^\circ\text{C})$; temp range 64.5–117.56°C (Antoine eq. from reported exptl. data of Brown & Smith 1959, Boublik et al. 1984)	
$\log (P/\text{kPa}) = 6.7666 - 1460.309/(189.211 + t/^\circ\text{C})$; temp range 22.6–117.8°C (Antoine eq. from reported exptl. data of Kemme & Kreps 1969, Boublik et al. 1984)	
936	(Daubert & Danner 1985)
824	(interpolated-Antoine eq., Dean 1985)
$\log (P/\text{mmHg}) = 7.47680 - 1362.39/(178.77 + t/^\circ\text{C})$; temp range 15–131°C (Antoine eq., Dean 1985, 1992)	
910	(selected, Riddick et al. 1986)
$\log (P/\text{kPa}) = 6.54743 - 1338.769/(177.042 + t/^\circ\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)	
$\log (P_L/\text{kPa}) = 6.41661 - 1264.515/(-104.202 + T/K)$; temp range 376–399 K (Antoine eq.-I, Stephenson & Malanowski 1987)	
$\log (P_L/\text{kPa}) = 6.54172 - 1336.026/(-96.348 + T/K)$; temp range 323–413 K (Antoine eq.-II, Stephenson & Malanowski 1987)	
$\log (P_L/\text{kPa}) = 7.05559 - 1738.4/(-46.544 + T/K)$, temp range: 413–550 K, (Antoine eq.-III, Stephenson & Malanowski 1987)	
$\log (P_L/\text{kPa}) = 8.9241 - 2697/(T/K)$; temp range 209–251 K (Antoine eq.-IV, Stephenson & Malanowski 1987)	
$\log (P_L/\text{kPa}) = 6.41594 - 1264.106/(-104.251 + T/K)$; temp range 376–397 K (Antoine eq.-V, Stephenson & Malanowski 1987)	
$\log (P_L/\text{kPa}) = 6.54723 - 1339.093/(-96.03 + T/K)$; temp range 351–397 K (Antoine eq.-VI, Stephenson & Malanowski 1987)	

- 905* (298.11 K, static method-Hg manometer, measured range 283.10–323.12 K, Gracia et al. 1992)
 998 (calculated-solvatochromic parameters, Banerjee et al. 1990)
 $\log(P/\text{mmHg}) = 39.6673 - 4.0017 \times 10^3/(T/K) - 10.295 \cdot \log(T/K) - 3.2572 \times 10^{-10} \cdot (T/K) + 8.6672 \times 10^{-7} \cdot (T/K)^2$;
 temp range 184–563 K (vapor pressure eq., Yaws 1994)
 933* (static method-manometer, measured range 278.15–323.15 K, Garriga et al. 2002)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.866 (measured partial pressure/mole fraction x at dilute concn, Butler et al. 1935)
 0.731 (entrainment method-GC, Burnett 1963)
 0.892 (shake flask, partial vapor pressure-GC, Buttery et al. 1969)
 0.860; 0.964; 1.057 (exptl.; calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 0.80* (headspace-GC, measured range 0–25°C, Snider & Dawson 1985)
 0.860 (limiting activity coefficient by headspace-GC., Abraham et al. 1987)
 4.024* (40°C, equilibrium headspace-GC, measured range 40–80°C, Kolb et al. 1992)
 $\ln(K_{\text{AW}}) = -10.2 + 5234/(T/K)$; temp range: 40–80°C (equilibrium headspace-GC measurements, Kolb et al. 1992)
 0.880 (limiting activity coefficient by headspace-GC., Li & Carr 1993)
 0.868 (wetted-wall column-GC, Altschuh et al. 1999)
 1.214 (extrapolated-headspace GC data, measured range 40–90°C, Gupta et al. 2000)
 $\ln K_{\text{AW}} = 12.141 - 5982.0/(T/K)$; temp range 40–90°C (van't Hoff eq., headspace GC, Gupta et al. 2000)
 0.53 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 6.600 - 3009/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 0.83 (shake flask-CR, Collander 1951)
 0.84 (calculated- π constant, Hansch et al. 1968)
 0.88 (Hansch & Dunn III unpublished result, Leo et al. 1971; Hansch & Leo 1985)
 0.84, 0.86; 0.84 (calculated-fragment const.; calculated- π constant, Rekker 1977)
 0.89 (Hansch & Leo 1979)
 0.955 (HPLC-RV/RT correlation, Yonezawa & Urushigawa 1979)
 1.02 (HPLC-RV correlation, Yonezawa & Urushigawa 1979)
 0.80 (calculated by Rekker's method, Hanai et al. 1981)
 0.79 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)
 0.76 (calculated from measured activity coeff. γ , Wasik et al. 1981)
 0.93 (shake flask-RC, Cornford 1982)
 0.80 (RP-HPLC- k' correlation, D'Amboise & Hanai 1982)
 0.87 (shake flask-GC at pH 7, Riebesehl & Tomlinson 1986)
 0.79 (generator column-GC, Schantz & Martire 1987)
 0.80 (calculated from measured activity coeff., γ , Schantz & Martire 1987)
 0.87 (calculated- γ from UNIFAC, Banerjee & Howard 1988)
 0.823, 0.84 (calculated-CLOGP, calculated-M.O. indices, Bodor et al. 1989)
 0.84 (recommended, Sangster 1989, 1993)
 0.87 (calculated-UNIFAC activity coefficients, Dallos et al. 1993)
 0.89 (calculated-UNIFAC activity coeff., Dallos et al. 1993)
 0.88 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

- 4.19 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

- −0.439 (calculated as per Mackay 1982, Schultz et al. 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

1.85	(calculated- K_{OW} , Lyman et al. 1982)
0.64	(calculated-MCI χ , Gerstl & Helling 1987)
0.50	(soil, quoted exptl., Meylan et al. 1992)
0.39	(soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
0.50	(calculated- K_{OW} , Kollig 1993)
0.50	(soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: evaporation rate $k = 2.538 \times 10^{-4} \text{ mol m}^{-2} \text{ h}^{-1}$ was determined by gravimetric method with an air flow rate $k = (50 \pm 1) \text{ L h}^{-1}$ at $20 \pm 0.1^\circ\text{C}$ (Gückel et al. 1973);
estimated half-lives, $t_{1/2} \sim 2.4 \text{ h}$ in streams, $t_{1/2} \sim 3.9 \text{ h}$ in rivers and $t_{1/2} \sim 125.9 \text{ h}$ in lakes (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k = 2.2 \times 10^9 \text{ L mol}^{-1} \text{ s}^{-1}$ for the reaction with $1 \times 10^{-17} \text{ M}$ hydroxyl radical in water with $t_{1/2} \sim 1 \text{ yr}$ (Anbar & Neta 1967; quoted, Howard 1990)

photooxidation $t_{1/2} = 2602\text{--}104000 \text{ h}$ in water, based on measured rate constant for reaction with OH radical in aqueous solution (Dorfman & Adams 1973; quoted, Howard et al. 1991)

$k_{OH} = 6.8 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 292 K (relative rate method, Campbell et al. 1976)

photooxidation $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$t_{1/2} = 6.5 \text{ h}$ for the vapor phase reaction with photochemically produced NO radical in the atmosphere (Dilling et al. 1976; quoted, Howard 1990)

$k_{OH} = 4.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 K (Lyman et al. 1982)

$k = 0.58 \pm 0.06 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2.0-6.0 and $20\text{--}23^\circ\text{C}$ (Hoigné & Bader 1983)

$k_{OH}(\text{calc}) = 6.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 7.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

photooxidation $t_{1/2} = 8.8\text{--}87.7 \text{ h}$ in air, based on measured rate constant for the vapor-phase reaction with OH radical in air (Atkinson 1985; selected, Howard et al. 1991)

estimated half-life of 2.3 d for the vapor phase reaction with photochemically produced OH radical in the atmosphere (GEMS 1986; quoted, Howard 1990)

$k_{OH}(\text{exptl}) = 7.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{OH}(\text{calc}) = 6.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH} = (8.31 \pm 0.63) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (flash photolysis-resonance fluorescence, Wallington & Kurylo 1987a)

$k_{OH}(\text{exptl}) = 8.31 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $k(\text{soln}) = 7.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the reaction with OH radical in aqueous solution (flash photolysis-resonance fluorescence, Wallington & Kurylo 1987b)

$k_{OH} = 8.31 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 7.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{OH} = (7.2 - 8.31) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 292-296 K (review, Atkinson 1989)

$k_{OH} = 8.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1990)

$k_{OH} = (7.80 \pm 0.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{OH} = (8.56 \pm 0.70) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at $298 \pm 2 \text{ K}$ (Nelson et al. 1990)

$k_{OH}(\text{calc}) = 8.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation:

$t_{1/2}(\text{aq. aerobic}) = 24\text{--}168 \text{ h}$, based on unacclimated freshwater grab sample data (Hammerton 1955) and aqueous screening test data (Bridie et al. 1979; selected, Howard et al. 1991);

$k = 84.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$, average rate of biodegradation based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

$t_{1/2}$ (aq. anaerobic) = 96–1296 h, based on acclimated screening test data (Chou et al. 1979; selected, Howard et al. 1991) and aqueous aerobic biodegradation half-life (Howard et al. 1991);

k (calc) = $(0.959 \pm 0.063) \times 10^2 \text{ h}^{-1}$ by activated sludge (Yonezawa & Urushigawa 1979)

$k = 0.035\text{--}0.046 \text{ h}^{-1}$ in 30 mg/L activated sludge after a time lag of 5–10 h (Urano & Kato 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photodecomposition $t_{1/2} = 6.5 \text{ h}$ under simulated atmospheric conditions, with NO (Dilling et al. 1976);

$t_{1/2}$ (calc) = 1.2 d for the atmospheric reaction with $1 \times 10^{-6} \text{ molecules/cm}^3$ of OH radical (Howard 1990);

photooxidation $t_{1/2} = 8.8\text{--}87.7 \text{ h}$, based on measured rate constant for the vapor-phase reaction with OH radical in air (Atkinson 1985; selected Howard et al. 1991).

Surface water: $t_{1/2} = 24\text{--}168 \text{ h}$, based on unacclimated freshwater grab sample data (Hammerton 1955; selected, Howard et al. 1991) and aqueous screening test data (Bridie et al. 1979; selected, Howard et al. 1991);

photooxidation $t_{1/2} = 2602\text{--}104000 \text{ h}$, based on measured rate constant for reaction with hydroxyl radicals in aqueous solution (Dorfman & Adams 1973; selected, Howard et al. 1991);

estimated volatilization half-lives, $t_{1/2} = 2.4 \text{ h}$ in streams, $t_{1/2} = 3.9 \text{ h}$ in rivers and $t_{1/2} = 125.9 \text{ h}$ in lakes (Lyman et al. 1982; quoted, Howard 1990).

Groundwater: $t_{1/2} = 48\text{--}1296 \text{ h}$, based on estimated aqueous anaerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

FIGURE 11.1.1.5.3 Logarithm of Henry's law constant versus reciprocal temperature for 1-butanol.

11.1.1.6 Isobutanol (*i*-Butyl alcohol)

Common Name: Isobutanol

Synonym: isobutyl alcohol, 2-methyl-1-propanol, *i*-butyl alcohol

Chemical Name: isobutanol, isobutyl alcohol, 2-methyl-1-propanol

CAS Registry No: 78-83-1

Molecular Formula: $C_4H_{10}O$, $(CH_3)_2CHCH_2OH$

Molecular Weight: 74.121

Melting Point ($^{\circ}C$):

−101.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

1087.89 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8018 (Weast 1982–83)

0.8016, 0.7978 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

92.5 ($20^{\circ}C$, calculated-density)

103.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

6.32 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

56 (estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

100140 ($18^{\circ}C$, shake flask-turbidity, Fühner 1924)

85000 ($20^{\circ}C$, Seidell 1941)

75600 (shake flask-interferometry, Donahue & Bartell 1952)

94000 (shake flask-colorimetric, De Santis et al. 1976)

95000 ($18^{\circ}C$, Verschueren 1983)

76270 (IUPAC recommended, Barton 1984)

100000 (Dean 1985; Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1541* ($24.98^{\circ}C$, modified isoteniscope method, measured range 25 – $90^{\circ}C$, Butler et al. 1935)

$\log (P/mmHg) = 43.5513 - 4185/(T/K) - 11.50 \cdot \log (T/K)$; temp range 25 – $100^{\circ}C$ (isoteniscope measurements, Butler et al. 1935)

1648 (interpolated-regression of tabulated data, Stull 1947)

1333* ($21.7^{\circ}C$, summary of literature data, temp range -9.0 to $108^{\circ}C$, Stull 1947)

1527* (comparative ebulliometry, measured range 343.044 – $388.733\ K$, Ambrose & Sprake 1970)

$\log (P/Pa) = 6.35383 - 1194.628/(T/K - 106.291)$; restricted temp range 343 – $367.4\ K$ (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

$\log (P/Pa) = 6.50091 - 1275.197/(T/K - 97.363)$; temp range 343 – $388.8\ K$ (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

$\log (P/mmHg) = [-0.2185 \times 10936.0/(T/K)] + 9.1138032$; temp range -9.0 to $241^{\circ}C$ (Antoine eq., Weast 1972–73)

1527 (selected, Riddick et al. 1986)

$\log (P/kPa) = 6.50091 - 1295.197/(t/^{\circ}C + 175.787)$, temp range not specified (Riddick et al. 1986)

$\log (P_L/kPa) = 6.34528 - 1190.463/(-106.712 + T/K)$; temp range 369 – $389\ K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.49241 - 1271.027/(-97.758 + T/\text{K})$; temp range 313–411 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.05055 - 1511.48/(-81.634 + T/\text{K})$; temp range 381–524 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 9.8507 - 2875/(T/\text{K})$; temp range 202–243 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.34606 - 1190.8481/(-106.673 + T/\text{K})$; temp range 369–389 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.50104 - 1275.669/(-97.269 + T/\text{K})$; temp range 342–389 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.27047 - 1147.676/(-111.933 + T/\text{K})$; temp range 383–416 K (Antoine eq.-VII, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 109.2803 - 6.306 \times 10^3/(T/\text{K}) - 36.947 \cdot \log(T/\text{K}) + 1.4462 \times 10^{-2} \cdot (T/\text{K}) - 3.948 \times 10^{-13} \cdot (T/\text{K})^2$;
 temp range 165–548 K (vapor pressure eq., Yaws 1994)
 1500 (selected, Mackay et al. 1992, 1995)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

1.20 (measured partial pressure/mole fraction x at dilute concn, Butler et al. 1935)
 1.214 (exptl.- C_W/C_A , Hine & Mookerjee 1975)
 1.159, 1.057 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 0.992 (headspace-GC, Snider & Dawson 1985)
 1.186 (calculated-MCI χ , Nirmalakhandan & Speece 1988b)
 1.84 (solid-phase microextraction SPME-GC, Bartelt 1997)
 2.73 (gas stripping-GC, Shiu & Mackay 1997)
 0.892 (wetted-wall column-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.83 (shake flask-CR, Collander 1951)
 0.61 (calculated- π constant, Hansch et al. 1968)
 0.64 (Leo et al. 1969)
 0.65 (from Hansch & Dunn III unpublished result, Leo et al. 1971)
 0.76 (shake flask-GC, Dillingham et al. 1973)
 0.76 (shake flask, Hansch & Leo 1985; 1987)
 0.76 (recommended, Sangster 1989, 1993)
 0.76 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.80 (calculated-measured γ^∞ in pure octanol and vapor pressure P , Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2}(\text{calc}) = 79.7$ h for evaporation from a model river of 1-m deep with a current of 3 m/s and with a wind velocity of 3 m/s (Lyman et al. 1982; selected, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 201$ d to 22 yr in water, based on measured rate for the reaction with OH radical in water (Anbar & Neta 1967; selected, Howard et al. 1991)

photooxidation $t_{1/2} = 0.24$ –2.4 h in air for the gas-phase reaction with OH radical, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

photooxidation $t_{1/2} = 9.96\text{--}99.6$ h in air, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; selected, Howard et al. 1991).

Hydrolysis:

Biodegradation: biodegradation rate constant $k = 0.015\text{--}0.020$ h⁻¹ in 30 mg/L activated sludge after a time lag of 5–10 h (Urano & Kato 1986)

$t_{1/2}$ (aq. aerobic) = 43–173 h, based on river die-away data for one sample of water from one river (Hammerton 1955; selected, Howard et al. 1991)

$t_{1/2}$ (aq. anaerobic) = 172–692 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation half-life of 0.24–2.4 h in air for the gas-phase reaction with hydroxyl radicals, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976); photodecomposition $t_{1/2} = 3.5$ h under simulated atmospheric conditions, with NO (Dilling et al. 1976); photooxidation $t_{1/2} = 9.96\text{--}99.6$ h, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: photooxidation $t_{1/2} = 201$ d to 22 yr, based on measured rate for the reaction with hydroxyl radicals in water (Anbar & Neta 1967; quoted, Howard et al. 1991); $t_{1/2} = 43\text{--}173$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 86\text{--}346$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 43\text{--}173$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

biota:

FIGURE 11.1.1.6.1 Logarithm of vapor pressure versus reciprocal temperature for isobutanol.

11.1.1.7 *sec*-Butyl alcohol

Common Name: *sec*-Butyl alcohol

Synonym: 2-butyl alcohol, 2-butanol, methylethylcarbinol

Chemical Name: 2-butanol, *sec*-butyl alcohol

CAS Registry No: 78-92-2

Molecular Formula: $C_4H_{10}O$, $CH_3CH_2CHOHCH_3$

Molecular Weight: 74.121

Melting Point ($^{\circ}C$):

−88.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

99.51 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8063 (Weast 1982–83)

0.8065, 0.8024 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

91.9 ($20^{\circ}C$, calculated-density)

103.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

56 (estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

200000 ($20^{\circ}C$, synthetic method, Jones 1929)

185000 ($20^{\circ}C$, shake flask, Evans 1936)

198000* ($20^{\circ}C$, shake flask-refractometer, measured range 20 – $85^{\circ}C$, Morachevskii & Popovich 1965)

177000, 165000 (25 , $35^{\circ}C$, shake flask-titration, Ratouis & Dodé 1965)

202000* ($20^{\circ}C$, equilibrium pressure cell/shake flask-refractometric method, measured range 10 – $110^{\circ}C$, pressure range 1 – 800 atm, Moriyoshi et al. 1975)

225000 (shake flask-colorimetric analysis, De Santis et al. 1976)

130000 (shake flask-refractometric method, Becke & Quitzch 1977)

187000* (equilibrium pressure vessel/shake flask-GC, measured range 265 – $372 K$, pressure range 0.1 – 75 MPa, Bozdog & Lamb 1983)

181000* (recommended, IUPAC solubility series, temp range 10 – $110^{\circ}C$, Barton 1984)

196000* ($20^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.2^{\circ}C$, Stephenson & Stuart 1986)

175340* ($25.28^{\circ}C$, shake flask-laser scattering technique, measured range 276.94 – $386.6 K$, Ochi et al. 1996)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2286* (modified isoteniscope method, measured range 25 – $91^{\circ}C$. Butler et al. 1935)

$\log (P/mmHg) = 43.4800 - 4110/(T/K) - 11.50 \cdot \log (T/K)$; temp range 25 – $90^{\circ}C$ (isoteniscope measurements, Butler et al. 1935)

2266* (interpolated-regression of tabulated data, temp range -12.2 to $99.5^{\circ}C$, Stull 1947)

33031* ($73.392^{\circ}C$, ebulliometry, measured range 73.392 – $107.146^{\circ}C$, Biddiscombe et al. 1954)

10610* ($49.730^{\circ}C$, measured range 49.730 – $99.410^{\circ}C$, Brown et al. 1969)

2317* (comparative ebulliometry, measured range 67.723 – $107.743^{\circ}C$, Ambrose & Sprake 1970)

$\log (P/Pa) = 6.26852 - 1126.667/(T/K - 108.361)$; restricted temp range 67.7 – $83.34^{\circ}C$ (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

$\log (P/Pa) = 6.86618 - 1360.131/(T/K - 75.558)$; temp range 67.723 – $107.743^{\circ}C$ (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

2357 (Hoy 1970)

$\log(P/\text{mmHg}) = [-0.2185 \times 10712.3/(T/K)] + 9.096778$; temp range -12.2 – 251°C (Antoine eq., Weast 1972–73)
1600, 3200 (20°C, 30°C, Verschuereen 1983)

2200, 2190, 2275 (extrapolated-Antoine equations, Boublik et al. 1984)

$\log(P/\text{kPa}) = 6.35079 - 1169.924/(169.731 + t/^\circ\text{C})$; temp range 67.7 – 107.14°C (Antoine eq. from reported exptl. data of Ambrose & Sprake 1970, Boublik et al. 1984)

$\log(P/\text{kPa}) = 6.32690 - 1157.363/(168.32 + t/^\circ\text{C})$; temp range 72.39 – 107.15°C (Antoine eq. from reported exptl. data of Biddiscombe et al. 1954, Boublik et al. 1984)

$\log(P/\text{kPa}) = 6.47826 - 1235.4/(176.82 + t/^\circ\text{C})$; temp range 49.73 – 99.41°C (Antoine eq. from reported exptl. data of Brown et al. 1969, Boublik et al. 1984)

2438 (calculated-Antoine eq., Dean 1985)

$\log(P/\text{mmHg}) = 7.47431 - 1314.31/(186.55 + t/^\circ\text{C})$; temp range 25 to 120°C (Antoine eq., Dean 1985, 1992)

2317 (selected, Riddick et al. 1986)

$\log(P/\text{kPa}) = 6.35457 - 1171.893/(t/^\circ\text{C} + 169.955)$, temp range not specified (Riddick et al. 1986)

$\log(P_L/\text{kPa}) = 6.26823 - 1126.887/(-108.291 + T/K)$; temp range 359 – 381 K (Antoine eq-I., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.34976 - 1169.754/(-103.388 + T/K)$; temp range 3039 – 403 K (Antoine eq-II., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 5.74369 - 735.87/(-176.795 + T/K)$; temp range 372 – 5241 K (Antoine eq-III., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 7.50959 - 1751.931/(-52.906 + T/K)$; temp range 210 – 303 K (Antoine eq-IV., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.2663 - 1125.853/(-108.414 + T/K)$; temp range 359 – 380 K (Antoine eq-V., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.35314 - 1171.484/(-103.199 + T/K)$; temp range 340 – 379 K (Antoine eq-VI., Stephenson & Malanowski 1987)

2440, 997 (measured, calculated-solvatochromic parameters, Banerjee et al. 1990)

$\log(P/\text{mmHg}) = 49.4476 - 4.2487 \times 10^3/(T/K) - 13.793 \cdot \log(T/K) + 6.2736 \times 10^{-11} \cdot (T/K) + 2.1988 \times 10^{-6} \cdot (T/K)^2$;
temp range 158 – 536 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1.040 (measured partial pressure/mole fraction x at dilute concn, Butler 1935)

1.033 (exptl., Hine & Mookerjee 1975)

1.60, 1.057 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

0.918* (headspace-GC, measured range 0 – 25°C , Snider & Dawson 1985)

1.107 (calculated-MCI χ , Nirmalakhandan & Speece 1988b)

0.604 (20°C , selected from literature experimentally measured data, Staudinger & Roberts 2001)

$\log K_{\text{AW}} = 6.734 - 3031/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.61 (shake flask-GC, Hansch & Anderson 1967; Hansch et al. 1968)

0.74, 0.64 (calculated-f const., calculated- π const., Rekker 1977)

0.81 (HPLC-RT correlation, Yonezawa & Urushigawa 1979)

0.87 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)

0.65 (recommended, Sangster 1989)

0.61 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

3.99* (20.29°C , from GC determined γ^∞ in octanol, measured range 20.29 – 50.28°C , Gruber et al. 1997)

3.80 (calculated from determined γ^∞ in octanol and vapor pressure, Abraham et al. 2001)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 129$ d to 23 yr, based on measured rate for the reaction with hydroxyl radical in aqueous solution (Anbar & Neta 1967; Dorfman & Adams 1973; selected, Howard et al. 1991)

photooxidation $t_{1/2} = 0.24$ – 2.4 h for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100$ yr (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{OH} = 4.1 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ for at 25°C with $t_{1/2} = 1.3$ d (Hendry & Kenley 1979; quoted, Mill 1982)

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 24$ – 168 h, based on river die-away studies (Hammerton 1955; selected, Howard et al. 1991) and aqueous anaerobic $t_{1/2} = 96$ – 672 h, based on estimated aqueous aerobic biodegradation half-life (selected, Howard et al. 1991);

average rate of biodegradation $k_B = 55.0 \text{ (mg COD g}^{-1} \text{ h}^{-1})$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 0.24$ – 2.4 h for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976);

photodecomposition $t_{1/2} = 4.0$ h under simulated atmospheric conditions, with NO (Dilling et al. 1976);

photooxidation $t_{1/2} = 7.2$ – 72 h, based on measured rate constant for the reaction with OH radical in air (Edney & Corse 1986; selected, Howard et al. 1991);

calculated lifetimes of 1.3 d and 17 d for reactions with OH radical, NO_3 radical, respectively (Atkinson 2000)

Surface water: $t_{1/2} = 24$ – 168 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 48$ – 336 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24$ – 168 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

FIGURE 11.1.1.7.4 Logarithm of K_{OA} versus reciprocal temperature for *sec*-butyl alcohol.

11.1.1.8 *tert*-Butyl alcohol

Common Name: *tert*-Butyl alcohol

Synonym: 3-butanol, *t*-butyl alcohol, 2-methyl-2-propanol, trimethylcarbinol,

Chemical Name: *t*-butanol, *t*-butyl alcohol, 2-methyl-2-propanol

CAS Registry No: 75-65-0

Molecular Formula: C₄H₁₀O, (CH₃)₃COH

Molecular Weight: 74.121

Melting Point (°C):

25.69 (Lide 2003)

Boiling Point (°C):

82.4 (Lide 2003)

Density (g/cm³ at 20°C):

0.78581, 0.78086 (20°C, 25°C, Dreisbach & Martin 1949)

0.7883 (Weast 1982–83)

0.7858 (Dean 1985)

0.7812 (25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

94.2 (calculated-density, Rohrschneider 1973)

103.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

6.64 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

22.76, 56 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at 25°C (assuming ΔS = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

miscible (Palit 1947; Riddick et al. 1986)

miscible (Barton 1984; Dean 1985; Howard 1990; Yaws et al. 1990)

miscible (Yaws et al. 1990)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

5600* (static method/isoteniscope, measured range 20–90°C, Parks & Barton 1928)

5654* (24.98°C, modified isoteniscope method, measured range 30–80°C, Butler et al. 1935)

log (P/mmHg) = 43.2834 – 3935/(T/K) – 11.50·log (T/K); temp range 30–80°C (isoteniscope measurements, Butler et al. 1935)

5019* (interpolated-regression of tabulated data, temp range –20.4 to 82.9°C, Stull 1947)

log (P/mmHg) = 8.24380 – 1675.4/(230 + t/°C) (Antoine eq., Dreisbach & Martin 1949)

16500* (43.34°C, measured range 43.34–82.41°C, Dreisbach & Shrader 1949)

5637* (comparative ebulliometry, measured range 329.946–362.710 K, Ambrose & Sprake 1970)

log (P/Pa) = 6.24072 – 1049.320/(T/K – 107.724); restricted temp range 329.946–345.288 K (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

log (P/Pa) = 6.35648 – 1107.060/(T/K – 101.048); temp range 329.946–362.71 K (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)

log (P/mmHg) = [–0.2185 × 10413.2/(T/K)] + 9.193472; temp range –20.4 to 222.5°C (Antoine eq., Weast 1972–73)

5600 (Verschueren 1983; Howard et al. 1986)

5637 (selected, Riddick et al. 1986)

log (P/kPa) = 6.35648 – 1107.060/(t/°C + 172.102) temp not specified (Riddick et al. 1986)

log (P_L/kPa) = 6.22619 – 1042.416/(–108.5 + T/K); temp range 347–363 K (Antoine eq.-I, Stephenson & Malanowski 1987)

- $\log (P_L/\text{kPa}) = 6.35045 - 1104.341/(-101.315 + T/\text{K})$; temp range 299–375 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.27388 - 989.74/(-124.966 + T/\text{K})$; temp range 356–480 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.23125 - 1044.891/(-108.211 + T/\text{K})$, temp range: 347–363 K, (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.35498 - 1106.556/(-101.071 + T/\text{K})$; temp range 329–363 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.09542 - 975.944/(-116.864 + T/\text{K})$; temp range 357–461 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 1008, 5600 (calculated-solvatochromic parameters, quoted lit., Banerjee et al. 1990)
 $\log (P/\text{mmHg}) = 71.8181 - 4.9966 \times 10^3/(T/\text{K}) - 21.805 \cdot \log(T/\text{K}) + 1.9238 \times 10^{-8} \cdot (T/\text{K}) + 5.8247 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 299–506 K (vapor pressure eq., Yaws 1994)
 5610* (static method-manometer, measured range 298.15–323.15 K, Garriga et al. 2002)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 1.210 (measured partial pressure/mole fraction x at dilute concn, Butler et al. 1935)
 1.214 (exptl., Hine & Mookerjee 1975)
 1.057, 1.057 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 1.460* (25°C headspace-GC, measured range 0–25°C, Snider & Dawson 1985)
 1.426 (calculated-MCI χ , Nirmalakhandan & Speece 1988b)
 0.917 (wetted-wall column-GC, Altschuh et al. 1999)
 0.907 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 8.467 - 3488/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 0.37 (shake flask-GC, Hansch & Anderson 1967; Leo et al. 1969)
 0.59 (HPLC-RT correlation, Yonezawa & Urushigawa 1979)
 0.35 (Hansch & Leo 1985)
 0.40 (calculated-solvatochromic parameters, Taft et al. 1985)
 0.39 (HPLC- k' correlation, Funasaki et al. 1986)
 0.34 (shake flask, Log P Database, Hansch & Leo 1987)
 0.35 (recommended, Sangster 1989)
 0.34 (calculated-UNIFAC activity coefficient, Dallos et al. 1993)
 0.35 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

- 3.50 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

- 1.46 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 1.57 (soil, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated half-lives, $t_{1/2} = 51.6$ h in streams, $t_{1/2} = 65.37$ h in rivers and $t_{1/2} = 3104.3$ h in lakes were estimated by using Henry's law constant and assuming the wind velocity to be 3 m/s, the current velocities of the streams, rivers, and lakes 2, 1, and 0.01 m/s with depths of lakes 50 m and that of the streams and lakes 1 m deep (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

photooxidation $t_{1/2} = 771 \text{ d to } 64500 \text{ yr}$, based on measured rate for the reaction with hydroxyl radical in water (Howard et al. 1991)

photooxidation $t_{1/2} > 9.9 \text{ d}$ (Darnall et al. 1976)

$k \sim 0.003 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2–6 and 20–23°C (Hoigné & Bader 1983)

$k_{\text{OH}}(\text{calc}) = 6.9 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.09 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

photooxidation $t_{1/2} = 59\text{--}590 \text{ h}$, based on measured rate for the reaction with OH radical in air (Atkinson 1985; selected, Howard et al. 1991)

$k_{\text{OH}}(\text{calc}) = 5.9 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{exptl}) = 1.09 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}} = (1.08 \pm 0.11) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (flash photolysis-resonance fluorescence, Wallington & Kurylo 1987a)

$k_{\text{OH}} = 1.07 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 1.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{\text{OH}}^* = 1.07 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 243–440 K (flash photolysis-resonance fluorescence, Wallington 1988c)

$k_{\text{OH}}^* = 1.12 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k(\text{aq.}) = 0.01 \text{ M}^{-1} \text{ s}^{-1}$ at pH 2.3, $k = 0.45 \text{ M}^{-1} \text{ s}^{-1}$ at pH 2.2, $k = 0.46 \text{ M}^{-1} \text{ s}^{-1}$ at pH 5.2 for direct reaction with ozone in water and 20°C, with $t_{1/2} = 390 \text{ d}$ at pH 7 (Yao & Haag 1991).

$k_{\text{OH}}(\text{calc}) = 0.53 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation: average rate of biodegradation $30.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

$t_{1/2}(\text{aq. aerobic}) = 677\text{--}4320 \text{ h}$, based on river die-away studies; $t_{1/2}(\text{aq. anaerobic}) = 2400\text{--}12000 \text{ h}$, based on degradation rates in microcosm studies simulating anaerobic aquifers (Howard et al. 1991).

$t_{1/2}(\text{aerobic}) = 28 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 100 \text{ d}$ in natural waters (Capel & Larson 1995)

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} > 9.9 \text{ d}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

$t_{1/2} = 34.5 \text{ h}$ for 10 ppm in the air reacted with 5 ppm NO (Dilling et al. 1976);

photooxidation $t_{1/2} = 59\text{--}590 \text{ h}$, based on measured rate for the reaction with hydroxyl radical in air (Atkinson 1985; selected, Howard et al. 1991);

$t_{1/2} \sim 1.09 \text{ month}$ for the vapor phase reaction with photochemically produced hydroxyl radical in air (GEMS 1986; quoted, Howard 1990).

Surface water: $t_{1/2} \sim 8.8 \text{ yr}$, based on rate constant $k = 2.5 \times 10^8 \text{ L/mol}\cdot\text{s}$ for the reaction with hydroxyl radicals in water (Anbar & Neta 1967; quoted, Howard 1990);

$t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

measured rate constant $k = 0.001 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2.3 and 20°C, with $t_{1/2} = 390 \text{ d}$ at pH 7 (Yao & Haag 1991)

$t_{1/2}(\text{aerobic}) = 28 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 100 \text{ d}$ in natural waters (Capel & Larson 1995)

Groundwater: $t_{1/2} = 1344\text{--}8640 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 360\text{--}4800 \text{ h}$, based on soil microcosm studies (Howard et al. 1991).

Biota:

TABLE 11.1.1.8.1

11.1.1.9 1-Pentanol (*n*-Amyl alcohol)

Common Name: 1-Pentanol

Synonym: amyl alcohol, *n*-butylcarbinol, 1-pentanol, *n*-pentyl alcohol, pentyl alcohol

Chemical Name: *n*-amyl alcohol, *n*-pentyl alcohol, 1-pentanol

CAS Registry No: 71-41-0

Molecular Formula: $C_5H_{12}O$, $CH_3CH_2CH_2CH_2CH_2OH$

Molecular Weight: 88.148

Melting Point ($^{\circ}C$):

−77.6 (Lide 2003)

Boiling Point ($^{\circ}C$):

137.98 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.81253 ($25^{\circ}C$, Butler et al. 1935)

0.8144 (Weast 1982–83)

0.81445, 0.81080 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

108.0 (calculated-density, Lande & Banerjee 1981)

125.8 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

20.81 (Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.5 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

56 (estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

22080 (shake flask-interferometer, Butler et al. 1933)

21900* (volumetric method, measured range 20 – $30^{\circ}C$, Ginnings & Baum 1937)

22100 ($20^{\circ}C$, surface tension, Addison 1945)

23600 ($20^{\circ}C$, Seidell 1941)

11720 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)

22000* (recommended best value, IUPAC Solubility Data Series, temp range 0 – $180^{\circ}C$, Barton 1984)

22500* ($20.2^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.7^{\circ}C$, Stephenson et al. 1984)

20190 (shake flask-GC, Li & Andren 1994)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

333* ($25^{\circ}C$, extrapolated-modified isoteniscope method, measured range 60 – $131^{\circ}C$, Butler et al. 1935)

- $\log (P/\text{mmHg}) = 46.4925 - 4580/(T/K) - 12.42 \cdot \log (T/K)$; temp range 60–131°C (isoteniscope measurements, Butler et al. 1935)
- 349* (interpolated-regression of tabulated data, temp range 13.6–138°C, Stull 1947)
- 286* (extrapolated-ebulliometry, measured range 33.9–138°C, Kemme & Kreps 1969)
- 573.3* (33.9°C, ebulliometry-differential thermal analysis, measured range 33.9–138°C, Kemme & Kreps 1969)
- $\log (P/\text{mmHg}) = 7.55787 - 1492.549/(181.529 + t/^{\circ}\text{C})$; temp range 33.9–138°C, or pressure range 4.3–765.4 mmHg (Antoine eq., ebulliometry-differential thermal analysis, Kemme & Kreps 1969)
- 293* (comparative ebulliometry, measured range 74.763–156°C, Ambrose & Sprake 1970)
- $\log (P/\text{Pa}) = 6.13796 - 1190.412/(T/K - 123.055)$; restricted temp range 74.763–128.665°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)
- $\log (P/\text{Pa}) = 6.30306 - 1286.333/(T/K - 111.843)$; temp range 74.763–128.665°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)
- 313 (calculated-Antoine eq., Riddick & Bunger 1970)
- $\log (P/\text{mmHg}) = [-0.2185 \times 12495.5/(T/K)] + 9.574342$; temp range 13.6–137.8°C (Antoine eq., Weast 1972–73)
- 189 (20°C, extrapolated-Antoine eq. of Kemme & Kreps 1969, Gückel et al. 1982)
- 373 (20°C, Verschueren 1983)
- 172, 250 (extrapolated-Antoine equations., Boublik et al. 1984)
- $\log (P/\text{kPa}) = 6.00024 - 1103.91/(138.221 + t/^{\circ}\text{C})$; temp range 165–240.65°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
- $\log (P/\text{kPa}) = 6.31559 - 1292.273/(161.837 + t/^{\circ}\text{C})$; temp range 74.5–156°C (Antoine eq. from reported exptl. data of Ambrose & Sprake 1970, Boublik et al. 1984)
- 313 (extrapolated-Antoine eq., Dean 1985)
- $\log (P/\text{mmHg}) = 7.17758 - 1314.56/(168.11 + t/^{\circ}\text{C})$; temp range 37–138°C (Antoine eq., Dean 1985, 1992)
- 293 (selected, Riddick et al. 1986)
- $\log (P/\text{kPa}) = 6.30306 - 1286.333/(t/^{\circ}\text{C} + 161.307)$, temp range not specified (Riddick et al. 1986)
- $\log (P_L/\text{kPa}) = 6.14668 - 1195.924/(-122.348 + T/K)$; temp range 388–420 K (Antoine eq.-I, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 6.30990 - 1290.23/(-111.419 + T/K)$; temp range 347–429 K (Antoine eq.-II, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 6.1490 - 1197.233/(-122.194 + T/K)$; temp range 388–420 K (Antoine eq.-II, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 6.3975 - 1337.613/(-106.567 + T/K)$; temp range 326–411 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 6.28069 - 1277.413/(-112.34 + T/K)$; temp range 408–441 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
- $\log (P/\text{mmHg}) = 71.2535 - 5.4977 \times 10^3/(T/K) - 21.366 \cdot \log(T/K) + 3.8108 \times 10^{-10} \cdot (T/K) + 5.0339 \times 10^{-6} \cdot (T/K)^2$; temp range 196–586 K (vapor pressure eq., Yaws 1994)
- 891 (40°C, vapor-liquid equilibrium VLE data, Rhodes et al. 1997)

Henry's Law Constant (Pa m³/mol):

- 1.324 (measured partial pressure/mole fraction x at dilute concn, Butler et al. 1935)
- 1.271 (exptl., Hine & Mookerjee 1975)
- 1.426, 1.60 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
- 1.04 (calculated-P/C, Mackay & Yuen 1983)
- 1.017 (limiting activity coefficient by headspace-GC., Abraham et al. 1987)
- 1.271 (calculated-MCI χ , Nirmalakhandan & Speece 1988)
- 1.236 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
- 1.60 (correlated-molecular structure, Russell et al. 1992)
- 1.186 (limiting activity coefficient by headspace-GC., Li & Carr 1993)
- 1.057 (extrapolated-headspace GC data, measured range 40–90°C, Gupta et al. 2000)
- $\ln K_{AW} = 14.233 - 6559.6/(T/K)$; temp range 40–90°C (van't Hoff eq., headspace GC, Gupta et al. 2000)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 1.40 (from Hansch & Dunn III unpublished result, Leo et al. 1971; Hansch & Dunn III 1972)

- 1.37, 1.38; 1.34 (calculated-fragment const.; calculated- π constant, Rekker 1977)
 1.44, 1.48 (HPLC-RV/RT correlation, Yonezawa & Urushigawa 1979)
 1.53 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)
 1.33 (HPLC-RT correlation, D'Amboise & Hanai 1982)
 1.56 (shake flask, Log P Database, Hansch & Leo 1987)
 1.49 (shake flask-GC at pH 7, Riebesehl & Tomlinson 1986)
 1.53 (generator column-GC, Schantz & Martire 1987)
 1.55 (calculated from measured γ , Schantz & Martire 1987)
 1.51 (recommended value, Sangster 1989, 1993)
 1.41 (shake flask-GC, Fujiwara et al. 1991)
 1.56 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 4.69 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 0.241 (calculated as per Mackay 1982, Schultz et al. 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

- 0.93 (calculated-MCI χ , Gerstl & Helling 1987)
 0.70 (soil, quoted exptl., Meylan et al. 1992)
 0.65 (soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
 0.70 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: evaporation rate of $6.92 \times 10^{-5} \text{ mol cm}^{-2} \text{ h}^{-1}$ was determined by gravimetric method with an air flow rate of $(50 \pm 1) \text{ L h}^{-1}$ at $20 \pm 0.1^\circ\text{C}$ (Gückel et al. 1973).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976)

$k_{OH}(\text{exptl}) = 1.08 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k = 6.50 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the reaction with hydroxyl radical in aqueous solution at 298 K (flash photolysis-resonance fluorescence, Wallington & Kurylo 1987)

$k_{OH} = 1.08 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 6.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{OH} = 10.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (review, Atkinson 1989)

$k_{OH} = (12.0 \pm 1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{OH} = (10.5 \pm 1.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at $298 \pm 2 \text{ K}$ (Nelson et al. 1990)

$k_{OH}(\text{calc}) = 9.37 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976).

FIGURE 11.1.1.9.2 Logarithm of vapor pressure versus reciprocal temperature for 1-pentanol.

11.1.1.10 1-Hexanol

Common Name: 1-Hexanol

Synonym: amylcarbinol, 1-hexanol, *n*-hexyl alcohol

Chemical Name: *n*-hexyl alcohol, 1-hexanol

CAS Registry No: 111-27-3

Molecular Formula: $C_6H_{14}O$, $CH_3CH_2CH_2CH_2CH_2CH_2OH$

Molecular Weight: 102.174

Melting Point ($^{\circ}C$):

−47.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

157.6 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8136 (Weast 1982–83)

0.81875, 0.81534 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

126.0 (calculated-density, Lande & Banerjee 1981)

148.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

15.40 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

56 (estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

5000* ($20^{\circ}C$, shake flask-turbidity, measured range 0 – $110^{\circ}C$, Fühner 1924)

6240 (shake flask-interferometer, Butler et al. 1933)

5025 ($20^{\circ}C$, shake flask-turbidity, Laddha & Smith 1948)

6400* ($20^{\circ}C$, synthetic method, measured range 0 – $220^{\circ}C$, von Erichsen 1952)

6000 (shake flask-titration, Crittenden & Hixon 1954)

6300 (estimated, McGowan 1954)

6000 (surface tension, Kinoshita et al. 1958)

5838* (shake flask-refractive index, measured range 5.5 – $33.6^{\circ}C$, Hill & White 1974)

3590 (shake flask-GC, Korenman et al. 1974)

4230 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)

6000* (recommended best value, IUPAC Solubility Series, temp range 0 – $220^{\circ}C$, Barton 1984)

6660* ($20^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.3^{\circ}C$, Stephenson et al. 1984)

5354 (shake flask-GC, Li & Andren 1994)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

95.86* ($24.98^{\circ}C$, extrapolated-modified isoteniscope data, measured range 60.11 – $152.77^{\circ}C$, Butler et al. 1935)

$\log(P/mmHg) = 51.0030 - 5068/(T/K) - 13.80 \cdot \log(T/K)$, temp range 60 – $152^{\circ}C$ (isoteniscope measurements, Butler et al. 1935)

151.1* (interpolated-regression of tabulated data, temp range 24.4 – $157^{\circ}C$, Stull 1947)

88.25 (extrapolated, ebulliometry, measured range 52 – $157^{\circ}C$, Kemme & Kreps 1969)

760* ($52.2^{\circ}C$, ebulliometry-differential thermal analysis, measured range 52.3 – $157.3^{\circ}C$, Kemme & Kreps 1969)

$\log(P/mmHg) = 7.28781 - 1422.031/(t/^{\circ}C + 165.444)$; temp range 52 – $157^{\circ}C$ or pressure range 5.7 – $757.3\ mmHg$ (Antoine eq., ebulliometry-differential thermal analysis, Kemme & Kreps 1969)

$\log(P/mmHg) = [-0.2185 \times 12708.5/(T/K)] + 9.367617$; temp range 24.4 – $157^{\circ}C$ (Antoine eq., Weast 1972–73)

- 130.6 (20°C, Verschueren 1983)
 79.65, 79.7 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.20107 - 1305.63/(153.901 + t/^\circ\text{C})$; temp range 52.2–157.3°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.26314 - 1334.63/(156.297 + t/^\circ\text{C})$; temp range 60.11–152.7°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 55.5 (extrapolated from Antoine eq. of Kemme & Kreps 1969, Gückel et al. 1982)
 52.9, 254, 888 (20, 40, 60°C, evaporation rate-gravimetric method, Gückel et al. 1982)
 109.5 (extrapolated-Antoine eq., Dean 1985)
 $\log(P/\text{mmHg}) = 7.86045 - 1707.26/(196.66 + t/^\circ\text{C})$; temp range 35–157°C (Antoine eq., Dean 1985, 1992)
 110 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.41271 - 1422.031/(t/^\circ\text{C} + 165.444)$; temp range not specified (Riddick et al. 1986)
 111 (interpolated-Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.41271 - 1422.031/(-107.706 + T/\text{K})$; temp range 325–431 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 10.60355 - 3986.406/(46.713 + T/\text{K})$; temp range 298–343 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P/\text{mmHg}) = 53.9686 - 4.9501 \times 10^3/(T/\text{K}) - 15.199 \cdot \log(T/\text{K}) - 6.6922 \times 10^{-10} \cdot (T/\text{K}) + 2.3647 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 229–611 K (vapor pressure eq., Yaws 1994)
 113* (static method-manometry, measured range 278.15–323.15 K, Garriga et al. 1996)
 $\ln(P/\text{kPa}) = 8.472727 - 1275.055/(T/\text{K} - 178.568)$; temp range 278.15–323.15 K (Antoine eq., static method-manometry, Garriga et al. 1996)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

- 1.562 (measured partial pressure/mole fraction x at dilute aqueous solution, Butler et al. 1935)
 1.735 (shake flask, partial vapor pressure-GC, Buttery et al. 1969)
 1.562 (exptl., Hine & Mookerjee 1975)
 1.88, 2.367 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 1.46 (limiting activity coefficient by headspace-GC., Abraham et al. 1987)
 1.60 (calculated-MCI χ , Nirmalakhandan & Speece 1988b)
 1.896 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 1.56 (limiting activity coefficient by headspace-GC., Li & Carr 1993)
 1.016 (wetted-wall column-GC, Altschuh et al. 1999)
 2.60 (extrapolated-headspace GC data, measured range 40–90°C, Gupta et al. 2000)
 $\ln K_{\text{AW}} = 11.705 - 5538.7/(T/\text{K})$; temp range 40–90°C (van't Hoff eq., headspace GC, Gupta et al. 2000)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 2.03 (shake flask-GC, Hansch & Anderson 1967; Leo et al. 1971; Hansch & Dunn III 1972)
 1.99 (HPLC-RV correlation, Yonezawa & Urushigawa 1979)
 2.03 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)
 1.86 (RP-HPLC- k' correlation, D'Amboise & Hanai 1982)
 2.03 (HPLC- k' correlation, Funasaki et al. 1986)
 2.04 (shake flask-GC at pH 7, Riebesehl & Tomlinson 1986)
 2.03 (generator column-GC, Schantz & Martire 1987)
 2.05 (calculated from measured γ , Schantz & Martire 1987)
 1.50 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 2.03 (recommended, Sangster 1989, 1993)
 2.03 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

- 5.18 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

- 0.711 (calculated as per Mackay 1982, Schultz et al. 1990)

Sorption Partition Coefficient, log K_{OC} :

1.01	(soil, quoted exptl., Meylan et al. 1992)
0.92	(soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
1.01	(calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: evaporation rate of 1.85×10^{-5} mol·cm⁻²·h⁻¹ was determined by gravimetric method with an air flow rate of (50 ± 1) L·h⁻¹ at $(20 \pm 0.1)^\circ\text{C}$ (Gückel et al. 1973).

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 0.24\text{--}2.4$ h in air for the gas-phase reaction with hydroxyl radical, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976)

$k_{OH}(\text{exptl}) = (12.4 \pm 0.7) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹, $k_{OH}(\text{calc}) = 10.0 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ at 298 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a)

$k_{OH}(\text{exptl}) = 1.24 \times 10^{-11}$ cm³ molecule⁻¹ s⁻¹ at 298 K, and $k(\text{soln}) = 1.20 \times 10^{-11}$ cm³ molecule⁻¹ s⁻¹ for the reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{OH} = 12.4 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ at 298 K (Atkinson 1989)

$k_{OH} = (12.2 \pm 2.4) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ by pulse radiolysis-UV spectroscopy; $k_{OH} = (12.9 \pm 1.2) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ by relative rate method, at 298 ± 2 K (Nelson et al. 1990)

$k_{OH}(\text{calc}) = 10.48 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ (molecular orbital calculations, Klamt 1996)

FIGURE 11.1.10.2 Logarithm of vapor pressure versus reciprocal temperature for 1-hexanol.

11.1.1.11 1-Heptanol

Common Name: 1-Heptanol

Synonym: 1-heptanol, *n*-heptyl alcohol

Chemical Name: *n*-heptyl alcohol, 1-heptanol

CAS Registry No: 111-70-6

Molecular Formula: $C_7H_{16}O$, $CH_3(CH_2)_6OH$

Molecular Weight: 116.201

Melting Point ($^{\circ}C$):

−33.2 (Lide 2003)

Boiling Point ($^{\circ}C$):

176.45 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.82053 ($25^{\circ}C$, Butler et al. 1935)

0.8219 (Weast 1982–83; Dean 1985)

Molar Volume (cm^3/mol):

142.0 (calculated-density, Lande & Banerjee 1981)

170.2 (calculated- Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

56 (estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

930* ($18^{\circ}C$, shake flask-turbidity, measured range 70 – $130^{\circ}C$, Fühner 1924)

1804 (shake flask-interferometer, Butler et al. 1933)

1720 ($20^{\circ}C$, shake flask-titration, Addison 1943)

3288 (shake flask-centrifuge, Booth & Everson 1948)

1200 (shake flask-turbidimetric method, Harkins & Oppenheimer 1949)

2000* ($20^{\circ}C$, synthetic method, measured range 0 – $245^{\circ}C$, von Erichsen 1952)

1800 (estimated, McGowan 1954)

1700 (surface tension, Kinoshita et al. 1958)

1500* ($20^{\circ}C$, surface tension, 15 – $60^{\circ}C$, measured range Vochten & Petre 1973)

1676* (shake flask-interferometric method, measured range 6 – $34.9^{\circ}C$, Hill & White 1974)

1313 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)

1740* (recommended best value, IUPAC Solubility Data Series, temp range 0 – $240^{\circ}C$, Barton 1984)

1840* ($20.2^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.5^{\circ}C$, Stephenson et al. 1984)

1510 (shake flask-GC, Li & Andren 1994)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

29.86* (extrapolated, modified isoteniscope method, measured range 60 – $110^{\circ}C$, Butler et al. 1935)

$\log (P/mmHg) = 55.1972 - 5580/(T/K) - 15.41 \cdot \log (T/K)$; temp range 60 – $152^{\circ}C$ (isoteniscope measurements, Butler et al. 1935)

44.04* (extrapolated-regression of tabulated data, temp range 42.4 – $175.8^{\circ}C$, Stull 1947)

22.2 (extrapolated-Antoine eq., ebulliometry, Kemme & Kreps 1969)

626.6* ($63.5^{\circ}C$, ebulliometry-differential thermal analysis, measured range 63.6 – $176.4^{\circ}C$, Kemme & Kreps 1969)

$\log (P/mmHg) = 6.85450 - 1266.783/(139.663 + t/^{\circ}C)$; temp range 63.6 – $176.4^{\circ}C$, or pressure range 5.3 – 760 mmHg (Antoine eq., ebulliometry-differential thermal analysis, Kemme & Kreps 1969)

31.30 (calculated-Antoine eq., Jordan 1970)

$\log (P/mmHg) = [-0.2185 \times 13920.9/(T/K)] + 9.720613$; temp range 42.4 – $175.8^{\circ}C$ (Antoine eq., Weast 1972–73)

- 12.8 (20°C, extrapolated from Antoine eq. of Kemme & Kreps 1969, Gückel et al. 1982)
 24.0 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.10824 - 1323.566/(146.241 + t/^\circ\text{C})$; temp range 63.6–176.4°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.01857 - 1278.78/(146.403 + t/^\circ\text{C})$; temp range 60.11–152.8°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 17.64 (extrapolated-Antoine eq., Dean 1985)
 $\log(P/\text{mmHg}) = 6.64767 - 1140.64/(126.56 + t/^\circ\text{C})$; temp range 60–176°C (Antoine eq., Dean 1985, 1992)
 $\log(P_L/\text{kPa}) = 5.9794 - 1256.783/(-133.487 + T/\text{K})$; temp range 336–450 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.10408 - 1322.62/(-126.87 + T/\text{K})$; temp range 335–450 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P/\text{mmHg}) = -19.9205 - 4.3239 \times 10^3/(T/\text{K}) + 18.794 \cdot \log(T/\text{K}) - 5.0553 \times 10^{-2} \cdot (T/\text{K}) + 2.6161 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 239–632 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

- 1.909 (measured partial pressure/mole fraction x at dilute concn, Butler et al. 1935)
 1.880 (exptl., Hine & Mookerjee 1975)
 2.656, 3.583 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 2.015 (calculated-MCI χ , Nirmalakhandan & Speece 1988)
 1.176 (computed-vapor liquid equilibrium VLE data, Yaws et al. 1991)
 5.55 (calculated-molecular structure, Russell et al. 1992)
 5.62 (gas stripping-GC, Shiu & Mackay 1997)
 1.165 (wetted-wall column-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 2.53 (Hansch & Dunn III 1972)
 2.41 (HPLC-RV correlation, Yonezawa & Urushigawa 1979)
 2.57 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)
 2.39 (RP-HPLC- k' correlation, D'Amboise & Hanai 1982)
 2.60 (HPLC- k' correlation, Funasaki et al. 1986)
 2.65 (shake flask-GC at pH 7, Riebesehl & Tomlinson 1986)
 2.57 (shake flask, Log P Database, Hansch & Leo 1987)
 2.57 (generator column-GC, Schantz & Martire 1987)
 2.57 (calculated-activity coeff. γ , Schantz & Martire 1987)
 1.83 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 2.62 (recommended, Sangster 1989, 1993)
 2.72 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

- 1.09 (calculated as per Mackay 1982, Schultz et al. 1990)

Sorption Partition Coefficient, $\log K_{oc}$:

- 1.48 (calculated-MCI χ , Gerstl & Helling 1987)
 1.14 (soil, quoted exptl., Meylan et al. 1992)
 1.19 (soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
 1.14 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: evaporation rate of $6.804 \times 10^{-6} \text{ mol cm}^{-2} \text{ h}^{-1}$ was determined by gravimetric method with an air flow rate of $(50 \pm 1) \text{ L h}^{-1}$ at 20°C (Gückel et al. 1973).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 0.24\text{--}2.4$ h in air for the gas-phase reaction with hydroxyl radical, based on the rate of disappearance of hydrocarbon due to reaction with OH radical in air (Darnall et al. 1976)

$k_{\text{OH}}(\text{exptl}) = (13.6 \pm 1.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = 10.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a)

$k_{\text{OH}}(\text{exptl}) = 1.36 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k(\text{soln}) = 1.20 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the s reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{\text{OH}} = (13.7 \pm 1.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 ± 2 K (relative rate method, Nelson et al. 1990)

FIGURE 11.1.1.11.2 Logarithm of vapor pressure versus reciprocal temperature for 1-heptanol.

11.1.1.12 1-Octanol (*n*-Octyl alcohol)

Common Name: 1-Octanol

Synonym: 1-octanol, *n*-octyl alcohol, capryl alcohol, heptylcarbinol

Chemical Name: *n*-octyl alcohol, 1-octanol

CAS Registry No: 111-87-5

Molecular Formula: $C_8H_{18}O$, $CH_3(CH_2)_7OH$

Molecular Weight: 130.228

Melting Point ($^{\circ}C$):

−14.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

195.15 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.827 (Weast 1982–83)

0.82499, 0.82157 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

158.0 (calculated-density, Rohrschneider 1973; Lande & Banerjee 1981)

192.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

42.3 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

56 (estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

586 (shake flask-interferometer, Butler et al. 1933)

760 ($30^{\circ}C$, shake flask-titration, Sobotka & Glick 1934.)

420 ($20^{\circ}C$, shake flask-surface tension, Addison 1945)

590 (shake flask-turbidimeter, McBain & Richard 1946)

500 (shake flask-titration, Crittenden & Hixon 1954)

582 (estimated, McGowan 1954)

490 (shake flask-surface tension, Kinoshita et al. 1958)

495 (shake flask-turbidity, Shinoda et al. 1959)

1000 ($30^{\circ}C$, shake flask-turbidimeter, Rao et al. 1961)

330 (calculated- K_{OW} , Hansch et al. 1968)

530 ($15^{\circ}C$, shake flask-surface tension, Vochten & Petre 1973)

600, 600 (40 , $60^{\circ}C$, shake flask-titration, Lavrova & Lesteva 1976)

10000, 5000 (95 , $115^{\circ}C$, shake flask-polythermic method, Zhuravleva et al. 1977)

540* (recommended best value, IUPAC Solubility Data Series, temp range 15 – $115^{\circ}C$, Barton 1984)

490* ($20.5^{\circ}C$, shake flask-GC/TC, measured range 20.5 – $90.3^{\circ}C$, Stephenson et al. 1984)

517 (shake flask-GC, Li et al. 1992)

417 (shake flask-GC, Li & Andren 1994)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

11.06* ($25^{\circ}C$, extrapolated-modified isoteniscope data, measured range 60.12 – $110^{\circ}C$, Butler et al. 1935)

$\log (P/mmHg) = 40.2105 - 4100/(T/K) - 10.35 \cdot \log (T/K)$; temp range 20 – $110^{\circ}C$ (isoteniscope measurements, Butler et al. 1935)

18.8* (extrapolated-regression of tabulated data, temp range 54 – $195.2^{\circ}C$, Stull 1947)

$\log (P/mmHg) = 8.29442 - 2302.3/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

7604* ($121.99^{\circ}C$, ebulliometry, measured range 121.99 – $195.28^{\circ}C$, Dreisbach & Shrader 1949)

- 5.28 (extrapolated-Antoine eq., ebulliometry- DTA, Kemme & Kreps 1969)
- 706.6* (78.9°C, ebulliometry-differential thermal analysis, measured range 78.9–195.3°C, Kemme & Kreps 1969)
- $\log (P/\text{mmHg}) = 6.62354 - 1196.639/(124.107 + t/^\circ\text{C})$; temp range 78.9–195.3°C, or pressure range 5.3–760 mmHg (Antoine eq., ebulliometry-differential thermal analysis, Kemme & Kreps 1969)
- 10* (comparative ebulliometry, measured range 113.274–206.123 K, Ambrose & Sprake 1970)
- $\log (P/\text{Pa}) = 5.79413 - 1434.755/(T/\text{K} - 149.407)$; restricted temp range 113.274–151.974°C, (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)
- $\log (P/\text{Pa}) = 5.88511 - 1264.322/(T/\text{K} - 142.420)$; temp range 113.274–206.123°C (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)
- 142* (54.88°C, comparative ebulliometry, measured range 328.03–386.96 K, data fitted to Chebyshev polynomial, Ambrose et al. 1974)
- 2.78 (20°C, extrapolated from Antoine eq. of Kemme & Kreps 1969, Gückel et al. 1982)
- 4.07, 32.3, 177 (20, 40, 60°C, evaporation rate-gravimetric method, Gückel et al. 1982)
- $\log (P/\text{mmHg}) = [-0.2185 \times 14262.4/(T/\text{K})] + 9.601156$; temp range: 54–195°C, (Antoine eq., Weast 1972–73)
- 10.06, 6.89, 5.74, 9.95 (extrapolated-Antoine eq., Boublik et al. 1984)
- $\log (P/\text{kPa}) = 6.80512 - 1752.302/(174.07 + t/^\circ\text{C})$; temp range 54.88–113.9°C (Antoine eq. from reported exptl. data of Ambrose et al. 1974, Boublik et al. 1984)
- $\log (P/\text{kPa}) = 5.98227 - 1322.952/(137.413 + t/^\circ\text{C})$; temp range 79.9–195.4°C (Antoine eq. from reported exptl. data of Kemme & Kreps 1969, Boublik et al. 1984)
- $\log (P/\text{kPa}) = 5.87970 - 1260.554/(130.23 + t/^\circ\text{C})$; temp range 113.3–206.1°C (Antoine eq. from reported exptl. data of Ambrose & Sprake 1970, Boublik et al. 1984)
- $\log (P/\text{kPa}) = 6.00162 - 1356.232/(144.452 + t/^\circ\text{C})$; temp range 229.05–250.8°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
- 13.43 (calculated-Antoine eq., Dean 1985)
- $\log (P/\text{mmHg}) = 12.0701 - 4506.8/(319.9 + t/^\circ\text{C})$; temp range 0–80°C (Antoine eq., Dean 1985, 1992)
- $\log (P/\text{mmHg}) = 6.83790 - 1310.62/(136.05 + t/^\circ\text{C})$; temp range 70–195°C (Antoine eq., Dean 1985, 1992)
- 14.5 (static measurement, Berti et al. 1986)
- 10.0 (Riddick et al. 1986)
- $\log (P/\text{kPa}) = 5.88511 - 1264.322/(t/^\circ\text{C} + 130.73)$; temp range not specified (Riddick et al. 1986)
- 13.5 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 5.90052 - 1273.291/(-141.417 + T/\text{K})$; temp range 386–480 K (Antoine eq.-I, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 5.342 - 3343/(T/\text{K})$; temp range 267–282 K (Antoine eq.-II, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 18.014 - 5507/(T/\text{K})$; temp range 238–251 K (Antoine eq.-III, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 5.7934 - 1208.201/(-149.366 + T/\text{K})$; temp range 430–474 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 6.39406 - 1540.599/(-114.618 + T/\text{K})$; temp range 328–400 K (Antoine eq.-V, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 5.90632 - 1276.86/(-140.996 + T/\text{K})$; temp range 397–479 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
- 10.58 (Daubert & Danner 1989; quoted, Howard 1993)
- $\log (P/\text{mmHg}) = -26.3876 - 4.2263 \times 10^3/(T/\text{K}) + 21.093 \cdot \log(T/\text{K}) - 5.0048 \times 10^{-2} \cdot (T/\text{K}) + 2.4611 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 258–653 K (vapor pressure eq., Yaws 1994)
- 8.0* (static method-manometry, measured range 278.15–323.15 K, Garriga et al. 1996)
- $\ln (P/\text{kPa}) = 13.058110 - 2443.493/(T/\text{K} - 162.071)$; temp range 278.15–323.15 K (Antoine eq., static method-manometry, Garriga et al. 1996)

Henry's Law Constant (Pa·m³/mol at 25°C):

- 2.454 (measured partial pressure/mole fraction x at dilute concn, Butler et al. 1935)
- 2.479 (shake flask, partial vapor pressure-GC, Buttery et al. 1969)
- 2.422 (exptl., Hine & Mookerjee 1975)
- 3.344, 6.085 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
- 2.537 (calculated-MCI χ , Nirmalakhandan & Speece 1988)

- 1.609 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 1.537 (wetted-wall column-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, log K_{OW} :

- 3.15 (shake flask-CR, Collander 1951)
 2.84 (calculated- π constant, Hansch et al. 1968)
 3.03 (Hansch & Dunn III 1972)
 2.95, 2.97; 2.84 (calculated-f const.; calculated- π constant, Rekker 1977)
 2.97 (HPLC- k' correlation, Könemann et al. 1979)
 2.80 (HPLC-RV correlation, Yonezawa & Urushigawa 1979)
 2.92 (RP-HPLC- k' correlation, D'Amboise & Hanai 1982)
 3.16 (shake flask-GC, Platford 1983)
 2.97 (Hansch & Leo 1985)
 3.27 (shake flask-GC at pH 7, Riebesehl & Tomlinson 1986)
 2.14 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 3.07 (recommended, Sangster 1989, 1993)
 3.00 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} :

- 6.03 (calculated-measured γ^∞ in pure octanol and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, log BCF:

- 0.307 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1993)
 0.097 (calculated-S, Lyman et al. 1982; quoted, Howard 1993)
 1.651 (calculated as per Mackay 1982, Schultz et al. 1990)

Sorption Partition Coefficient, log K_{OC} :

- 2.99 (soil, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1993)
 2.14 (soil, calculated-S, Lyman et al. 1982; quoted, Howard 1993)
 1.56, 1.76 (quoted, calculated-MCI χ , Gerstl & Helling 1987)
 1.56 (soil, quoted exptl., Meylan et al. 1992)
 1.45 (soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
 1.56 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization: evaporation rate $k = 1.752 \times 10^{-6} \text{ mol}\cdot\text{cm}^{-2}\cdot\text{h}^{-1}$ was determined by gravimetric method with an air flow rate $k = (50 \pm 1) \text{ L h}^{-1}$ at $20 \pm 0.1^\circ\text{C}$ (Gückel et al. 1973);

$t_{1/2} \sim 1.8 \text{ d}$ from a model river of 1-m deep flowing at 1 m/s with a wind speed of 3 m/s, based on calculated Henry's law constant (Lyman et al. 1982; quoted, Howard 1993);

$t_{1/2} \sim 8.2 \text{ d}$ from a model pond with the consideration of adsorption (USEPA 1987; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation half-life of 0.24–2.4 h in air for the gas-phase reaction with OH radical, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k \leq 0.8 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{OH} = (13.6 \pm 1.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Wallington et al. 1988a; Atkinson 1989)

$k_{OH} = (14.4 \pm 1.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (relative rate method, Nelson et al. 1990)

$k_{OH}(\text{calc}) = 11.67 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.24\text{--}2.4$ h in air for the gas-phase reaction with hydroxyl radical, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photooxidation $t_{1/2} = 1.3$ d in air, based on measured rate constant $k = 1.195 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with photochemically produced hydroxyl radical of $5 \times 10^5 \text{ cm}^{-3}$ at 25°C in air (Atkinson 1987; quoted, Howard 1993).

Surface water:

11.1.1.13 1-Nonanol

Common Name: 1-Nonanol

Synonym: *n*-nonyl alcohol

Chemical Name: 1-nonanol

CAS Registry No: 143-08-8

Molecular Formula: $C_9H_{20}O$, $CH_3(CH_2)_8OH$

Molecular Weight: 144.254

Melting Point ($^{\circ}C$):

−5 (Lide 2003)

Boiling Point ($^{\circ}C$):

213.37 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8273 (Weast 1982–83)

Molar Volume (cm^3/mol):

174.4 ($20^{\circ}C$, Stephenson and Malanowski 1987)

214.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

140 (shake flask-surface tension, Kinoshita et al. 1958)

140 ($15^{\circ}C$, shake flask-surface tension, Vochten and Petre 1973)

130 (recommended-IUPAC Solubility Data Series, Barton 1984)

280* ($20^{\circ}C$, shake flask-GC/TC, measured range 9.8 – $90.5^{\circ}C$, Stephenson & Stuart 1986)

128 ($20^{\circ}C$, shake flask/slow stirring-GC, Letinski et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and the reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($59.5^{\circ}C$, summary of literature data, temp range 59.5 – $213.5^{\circ}C$, Stull 1947)

746.6* ($91.7^{\circ}C$, ebulliometry-differential thermal analysis, measured range 91.7 – $213.6^{\circ}C$, Kemme & Kreps 1969)

$\log(P/mmHg) = 6.83667 - 1373.417/(133.968 + t/^{\circ}C)$; temp range 91.7 – $213.6^{\circ}C$, or pressure range 5.6 – 757.5 mmHg (Antoine eq., ebulliometry-differential thermal analysis, Kemme & Kreps 1969)

$\log(P/mmHg) = [-0.2185 \times 14065.1/(T/K)] + 8.99150$; temp range 69.5 – $231^{\circ}C$ (Antoine eq., Weast 1972–73)

7.466 ($20^{\circ}C$, extrapolated from data of Stull 1947, Gückel et al. 1973)

1.87 ($20^{\circ}C$, evaporation rate-gravimetric method, Gückel et al. 1973)

12680* ($152.15^{\circ}C$, ebulliometry, measured range 152 – $221.35^{\circ}C$, Hon et al. 1976)

0.106 ($20^{\circ}C$, evaporation rate-gravimetric method, Gückel et al. 1982)

$\log(P_L/kPa) = 5.9049 - 1341.28/(-142.64 + T/K)$; temp range 381 – 495 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.9454 - 1366.566/(-139.73 + T/K)$; temp range 368 – 500 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P/mmHg) = 103.0308 - 8.1526 \times 10^3/(T/K) - 31.641 \cdot \log(T/K) - 7.230 \times 10^{-10} \cdot (T/K) + 6.0332 \times 10^{-6} \cdot (T/K)^2$; temp range 280 – 690 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

1.675 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.77	(generator column-GC, Tewari et al. 1982)
4.26	(shake flask, Log P Database, Hansch & Leo 1987)
4.26	(recommended, Sangster 1993)
4.26	(shake flask, recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

FIGURE 11.1.1.13.2 Logarithm of vapor pressure versus reciprocal temperature for 1-nonanol.

11.1.1.14 1-Decanol

Common Name: 1-Decanol

Synonym: decyl alcohol

Chemical Name: 1-decanol

CAS Registry No: 112-30-1

Molecular Formula: $C_{10}H_{22}O$, $CH_3(CH_2)_8CH_2OH$

Molecular Weight: 158.281

Melting Point ($^{\circ}C$):

6.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

231.1 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8297 (Weast 1982–83)

Molar Volume (cm^3/mol):

190.8 ($20^{\circ}C$, calculated-density, Stephenson and Malanowski 1987)

236.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

- 50 (shake flask-turbidimetric method, Stearns et al. 1947)
- 36 ($20^{\circ}C$, shake flask-surface tension, Addison and Hutchinson 1949)
- 50 (shake flask-turbidimetric method-photometer, Harkins and Oppenheimer 1949)
- 37 (shake flask-surface tension, Kinoshita et al. 1958)
- 32 ($15^{\circ}C$, shake flask-surface tension, Vochten and Petre 1973)
- 10000, 8000 ($102.5, 120.5^{\circ}C$, polythermic method, Zhuravleva et al. 1977)
- 37* (recommended-IUPAC Solubility Data Series, temp range 15 – $120^{\circ}C$, Barton 1984)
- 210* ($29.6^{\circ}C$, shake flask-GC/TC, measured range 29.6 – $90.4^{\circ}C$, Stephenson 1992)
- 35.9 (dialysis tubing equilibration-GC, Etzweiler et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 133.3* ($69.5^{\circ}C$, summary of literature data, temp range 69.5 – $231.0^{\circ}C$, Stull 1947)
- 747* ($105.0^{\circ}C$, ebulliometry-differential thermal analysis, measured range 105 – $231^{\circ}C$, Kemme & Kreps 1969)
- $\log (P/mmHg) = 6.39379 - 1180.306/(104.321 + t/^{\circ}C)$; temp range 105 – $231^{\circ}C$, or pressure range 5.6 – 757.5 mmHg (Antoine eq., ebulliometry-differential thermal analysis, Kemme & Kreps 1969)
- 1.0* (comparative ebulliometry, measured range 127.261 – $255.2^{\circ}C$, Ambrose & Sprake 1970)
- $\log (P/Pa) = 5.94387 - 1434.755/(T/K - 139.888)$; restricted temp range 127.261 – $194.484^{\circ}C$ (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)
- $\log (P/Pa) = 5.86571 - 1373.916/(T/K - 147.202)$; temp range 127.16 – $255.2^{\circ}C$ (Antoine eq., comparative ebulliometry, Ambrose & Sprake 1970)
- 124* ($76.23^{\circ}C$, comparative ebulliometry, measured range 349.38 – $406.19\ K$, data fitted to Chebyshev polynomial, Ambrose et al. 1974)
- $\log (P/mmHg) = [-0.2185 \times 13849.2/(T/K)] + 9.115470$; temp range 59.5 – $213.5^{\circ}C$ (Antoine eq., Weast 1972–73)
- 0.5866 ($20^{\circ}C$, evaporation rate-gravimetric method, Gückel et al. 1973)
- 1.10 ($20^{\circ}C$, evaporation rate-gravimetric method, Gückel 1982)

$\log (P/\text{kPa}) = 5.76028 - 1315.079/(119.128 + t/^{\circ}\text{C})$, temp range 105–231°C (Antoine eq. derived from exptl. data of Kemme & Kreps 1969, Boublik et al. 1984)

$\log (P/\text{kPa}) = 5.84611 - 1365.892/(124.619 + t/^{\circ}\text{C})$, temp range 127.2–255.2°C (Antoine eq. derived from data of Ambrose & Sprake 1970, Boublik et al. 1984)

$\log (P_{\text{S}}/\text{kPa}) = 17.615 - 6028/(T/\text{K})$; temp range 264–279 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_{\text{L}}/\text{kPa}) = 6.57397 - 1761.308/(-113.992 + T/\text{K})$; temp range 349–410 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_{\text{L}}/\text{kPa}) = 5.8587 - 1374.347/(-147.547 + T/\text{K})$; temp range 405–528 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 111.7949 - 8.3502 \times 10^3/(T/\text{K}) - 34.786 \cdot \log(T/\text{K}) + 3.3682 \times 10^{-10} \cdot (T/\text{K}) + 7.2697 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 268–673 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

2.689 (computer value, Yaws et al. 1991)

3.222 (wetted-wall column-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

3.98 (HPLC-RT correlation, D'Amboise & Hani 1982)

4.57 (shake flask, Log P Database, Hansch & Leo 1987)

4.57 (recommended, Sangster 1993)

4.57 (shake flask, recommended, Hansch et al. 1995)

11.1.1.15 Ethylene glycol

Common Name: Ethylene glycol

Synonym: 1,2-ethanediol, 1,2-dihydroxyethane, MEG

Chemical Name: 1,2-ethanediol, ethylene glycol

CAS Registry No: 107-21-1

Molecular Formula: $C_2H_6O_2$, $HOCH_2CH_2OH$

Molecular Weight: 62.068

Melting Point ($^{\circ}C$):

−12.69 (Lide 2003)

Boiling Point ($^{\circ}C$):

197.3 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1088 (Weast 1982–83)

Molar Volume (cm^3/mol):

55.8 (Rohrschneider 1973)

66.6 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

14.22 (Dean 1985)

14.24 (Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

9.958 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Dean 1985; Howard 1990; Yaws et al. 1990)

miscible (Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

22.39 (extrapolated-Antoine eq., differential manometer, Gallagher & Hibbert 1937)

$\log (P/mmHg) = 9.2087 - 2976.6/(T/K)$; temp range 40 – $120^{\circ}C$ (Antoine eq. from differential Hg manometry measurements, Gallagher & Hibbert 1937)

133.3* ($53.0^{\circ}C$, summary of literature data, temp range 53.0 – $197.3^{\circ}C$, Stull 1947)

$\log (P/mmHg) = [-0.2185 \times 14032.4/(T/K)] + 9.394685$; temp range: 53 – $197.3^{\circ}C$ (Antoine eq., Weast 1972–73)

11.70* (ebulliometry, extrapolated-Antoine eq., measured range 270 – $310 K$, Ambrose & Hall 1981)

$\log (P/kPa) = 11.1828 - 2611.2/[(T/K) - 40.0]$; temp range 270 – $310 K$ (ebulliometry, Antoine eq., Ambrose & Hall 1981)

$\log (P/kPa) = 6.83995 - 1818.591/[(T/K) - 94.499]$; temp range 374.01 – $495.4 K$ (Antoine eq., ebulliometry, Ambrose & Hall 1981)

7.40* ($20^{\circ}C$, average, gas saturation-GC/FID, Hales et al. 1981)

$\log (P/mmHg) = 23.7259 - 4648.55/(T/K) - 503391/(T/K)^2$; temp range 283 – $373 K$ (empirical vapor pressure eq., gas saturation, Hales et al. 1981)

14.90 ($20^{\circ}C$, evaporation method, Gückel et al. 1982)

6.67, 26.66 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1983)

0.73, 9.30 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 5.69339 - 1093.154/(98.821 + t/^{\circ}C)$; temp range 122.5 – $186.5^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/kPa) = 7.13856 - 2035.185/(1936.936 + t/^{\circ}C)$; temp range 50 – $200^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

11.86 (extrapolated-Antoine eq., Dean 1985)

11.7 (Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.83995 - 1818.591/(178.651 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log (P/\text{kPa}) = 8.3726 - 2994.4/(T/\text{K})$, temp range 130–190°C, (Antoine eq., Riddick et al. 1986)
 $\log (P/\text{mmHg}) = 8.0908 - 2088.9/(203.5 + t/^{\circ}\text{C})$; temp range 50–200°C (Antoine eq., Dean 1985, 1992)
 10.1 (extrapolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.98465 - 1928.08/(-83.45 + T/\text{K})$; temp range 323–473 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.86912 - 1817.439/(-95.859 + T/\text{K})$, temp range 363–418 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 12.26 (Howard et al. 1986; quoted, Banerjee et al. 1990)
 $\log (P/\text{mmHg}) = 82.4062 - 6.3472 \times 10^3/(T/\text{K}) - 25.433 \cdot \log(T/\text{K}) - 2.3732 \times 10^{-9} \cdot (T/\text{K}) + 8.7467 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 160–645 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

0.006 (calculated- C_W/C_A , Hine & Mookerjee 1975)
 5.81×10^{-6} , 2.37×10^{-5} (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

-1.93 (shake flask, Hansch & Leo 1979)
 -1.34 (shake flask-RC, Cornford 1982)
 -1.36 (shake flask, Log P Database, Hansch & Leo 1987)
 -1.36 (recommended, Sangster 1993)
 -1.36 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

1.00 (golden ide, after 3 d, Freitag et al. 1985)
 2.28 (algae, after 1 d, Freitag et al. 1985)
 2.30 (activated sludge, after 5 d, Freitag et al. 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: evaporation rate $k = 2.915 \times 10^{-6} \text{ mol cm}^{-2} \text{ h}^{-1}$ was determined by gravimetric method with an air flow rate $k = (50 \pm 1) \text{ L h}^{-1}$ at $20 \pm 0.1^{\circ}\text{C}$ (Gückel et al. 1973);
 evaporation rate $k = 2.97 \times 10^{-8} \text{ mol cm}^{-2} \text{ h}^{-1}$ was determined at 20°C (Gückel et al. 1982).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 photooxidation $t_{1/2} = 267 \text{ d}$ –64.6 yr in water, based on measured rate constant for the reaction with OH radical (Anbar & Neta 1967; Dorfman & Adams 1973; selected, Howard et al. 1991)
 photooxidation $t_{1/2} = 0.24$ –2.4 h in air for the gas-phase reaction with OH radical, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)
 $k_{OH} = (7.7 \pm 1.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K in air (Wiedermann & Zetzsch 1982; quoted, Atkinson 1985)
 photooxidation $t_{1/2} = 8.3$ –83 h in air, based on measured rate constant for the reaction with OH radical in air (Atkinson 1985; selected, Howard et al. 1991)

Hydrolysis:

Biodegradation:

$k = 41.7 \text{ mg COD g}^{-1} \text{ h}^{-1}$, average rate based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);
 $k = 0.026$ –0.035 h^{-1} in 30 mg/L activated sludge after a time lag of 10–15 h (Urano & Kato 1986b)
 $t_{1/2}(\text{aq. aerobic}) = 48$ –288 h, based on grab sample from river die-away studies (Evans & David 1974; selected, Howard et al. 1991);

$t_{1/2}$ (aq. anaerobic) = 192–1152 h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2}$ = 0.24–2.4 h in air for the gas-phase reaction with hydroxyl radical, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photooxidation $t_{1/2}$ = 8.3–83 h, based on measured rate constant for the reaction with hydroxyl radical in air (Atkinson 1985; selected, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be 1 to 5 d (Kelly et al. 1994).

Surface water: photooxidation $t_{1/2}$ = 267 d–64.6 yr, based on measured rate constant for the reaction with hydroxyl radicals in water (Anbar & Neta 1967; Dorfman & Adams 1973; quoted, Howard et al. 1991); $t_{1/2}$ = 48–288 h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2}$ = 96–576 h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2}$ = 48–288 h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota

11.1.1.16 Allyl alcohol

Common Name: Allyl alcohol

Synonym: propenylalcohol, 2-propen-1-ol, 1-propene-3-ol, vinylcarbinol

Chemical Name: allyl alcohol, 1-propene-3-ol, 2-propen-1-ol

CAS Registry No: 107-18-6

Molecular Formula: C_3H_6O , $CH_2=CHCH_2OH$

Molecular Weight: 58.079

Melting Point ($^{\circ}C$):

-129 (Stull 1947; Weast 1982–83; Verschueren 1983; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

97.1 (Weast 1982–83; Dean 1985; Riddick et al. 1986)

97 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.854 (Weast 1982–83; Dean 1985)

0.85511 ($15^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

64.8 (Kamlet et al. 1986; Leahy 1986)

74.0 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

15.5 (Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Dean 1985)

miscible (Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2666* ($21.7^{\circ}C$, temp range -20 to $96.6^{\circ}C$, Stull 1947)

3140 (Hoy 1970)

$\log(P/mmHg) = [-0.2185 \times 10577.7/(T/K)] + 9.143231$; temp range -20 to $96.6^{\circ}C$ (Antoine eq., Weast 1972–73)

2666, 4266 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1983)

3750 (Riddick et al. 1986)

$\log(P/kPa) = 31.75070 - 3451.8/(T/K) - 7.94975 \log(T/K)$; temp not specified (Riddick et al. 1986)

3298 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.40725 - 1790.13/(-38.295 + T/K)$; temp range 253 – 370 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 21.3978 - 2.9525 \times 10^3/(T/K) - 3.8137 \cdot \log(T/K) - 2.7145 \times 10^{-3} \cdot (T/K) + 1.8811 \times 10^{-6} \cdot (T/K)^2$; temp range 144 – 545 K (vapor pressure eq., Yaws 1994)

6954* ($38.28^{\circ}C$, ebulliometry, measured range 311.42 – 355.70 K, Lubomska & Malanowski 2004)

$\log(P/kPa) = 6.936209 - 1513.129/[(T/K) - 63.131]$; temp range 311.42 – 355.70 K (Antoine eq., ebulliometric method, Lubomska & Malanowski 2004)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.506 (calculated- C_W/C_A , Hine & Mookerjee 1975)

0.510 (calculated-bond contribution, Hine & Mookerjee 1975)

0.564 (computed, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.17	(shake flask, Hansch & Leo 1979)
0.17	(recommended, Sangster 1989)
0.17	(recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 334 \text{ d}$ – 37 yr , based on measured rate constant for the reaction with hydroxyl radical in water (Anbar & Neta 1967; quoted, Howard et al. 1991)

photooxidation $t_{1/2} = 2.2$ – 22 h , based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991)

$k_{OH} = 25.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 440 K (Atkinson 1989)

Biodegradation: $t_{1/2}(\text{aq. aerobic}) = 24$ – 168 h , based on estimated unacclimated aqueous aerobic biodegradation screening test data (Sasaki 1978; quoted, Howard et al. 1991); $t_{1/2}(\text{aq. anaerobic}) = 96$ – 672 h , based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 2.2$ – 22 h , based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: photooxidation $t_{1/2} = 334 \text{ d}$ – 37 yr , based on measured rate constant for the reaction with hydroxyl radical in water (Anbar & Neta 1967; quoted, Howard et al. 1991).

Groundwater: $t_{1/2} = 48$ – 336 h , based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Sediment:

Soil: $t_{1/2} = 24$ – 168 h , based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

11.1.1.17 Cyclohexanol

Common Name: Cyclohexanol

Synonym: adronol, anol, cyclohexylalcohol, hexahydrophenol, hexalin, hydralin, hydrophenol

Chemical Name: cyclohexanol

CAS Registry No: 108-93-0

Molecular Formula: $C_6H_{11}OH$

Molecular Weight: 100.158

Melting Point ($^{\circ}C$):

25.93 (Lide 2003)

Boiling Point ($^{\circ}C$):

160.84 (Lide 2003)

Density (g/cm^3):

0.9624 (Lide 2003)

Molar Volume (cm^3/mol):

104.0 (calculated-density, Lande & Banerjee 1981)

125.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

1.70 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

37000* (shake flask-synthetic method, temp range 7.2 – $184.72^{\circ}C$, Sidgwick & Sutton 1930)

39200 (shake flask-interferometry, Hansen et al. 1949)

32920 (residue volume, Booth & Everson 1942)

40000* ($20^{\circ}C$, synthetic method, measured range 0 – $184^{\circ}C$, Zil'berman 1951)

48960 (shake flask-interferometry, Donahue & Bartell 1952)

36000 ($26.7^{\circ}C$, shake flask-turbidity, Skrzec & Murphy 1954)

38000* (recommended "best" value, IUPAC Solubility Data Series, temp range 0 – $180^{\circ}C$, Baron 1984)

37500 (selected, Riddick et al. 1986)

44400* ($19.7^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.3^{\circ}C$, Stephenson & Stuart 1986)

38200 (selected, Yaws et al. 1990)

37500 (dialysis tubing equilibration-GC. Etzweiler et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

467* ($34.0^{\circ}C$, Ramsay-Young method, measured range 34.0 – $149.0^{\circ}C$, Gardner & Brewer 1937)

133.1*, 194 ($21^{\circ}C$, interpolated-regression of tabulated data, temp range 21 – $161^{\circ}C$, Stull 1947)

7177* ($93.73^{\circ}C$, temp range 93.73 – $160.70^{\circ}C$, Novak et al. 1960; quoted, Boublik et al. 1984)

$\log(P/mmHg) = [-0.2185 \times 11935.8/(T/K)] + 8.909086$; temp range 21 – $161^{\circ}C$ (Antoine eq., Weast 1972–73)

174.8 (calculated-Cox eq., Chao et al. 1983)

$\log(P/mmHg) = [1 - 434.658/(T/K)] \times 10^{\{0.951396 - 8.46102 \times 10^{-4} \cdot (T/K) + 8.87926 \times 10^{-7} \cdot (T/K)^2\}}$; temp range 294.15 – $434.15\ K$ (Cox eq., Chao et al. 1983)

37.53 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 6.2553 - 912.87/(109.13 + t/^{\circ}C)$; temp range 94 – $161^{\circ}C$ (Antoine eq., Dean 1985, 1992)

1300 ($56^{\circ}C$, Riddick et al. 1986)

$\log(P/kPa) = 5.92859 - 1199.10/(t/^{\circ}C + 145.0)$; temp range 107 – $160^{\circ}C$ (Riddick et al. 1986)

97.36 (interpolated, solid, Antoine eq.-I, Stephenson & Malanowski 1987)

80.0, 84.85 (extrapolated, liquid, Antoine eq.-I and II, Stephenson & Malanowski 1987)

$\log(P_S/\text{kPa}) = 9.631 - 3173.1/(T/\text{K})$; temp range 272–298 K (Antoine eq.-I, for solid, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.1634 - 1318.5/(-116.55 + T/\text{K})$; temp range 318–434 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.27792 - 1381.8/(-110.132 + T/\text{K})$; temp range 300–434 K (Antoine eq.-III, liquid, Stephenson & Malanowski 1987)

106.6 (Daubert & Danner 1989)

14.66, 196.0 (quoted, calculated-solvatochromic parameters, Banerjee et al. 1990)

$\log(P/\text{mmHg}) = 49.9123 - 4.8446 \times 10^3/(T/\text{K}) - 13.711 \cdot \log(T/\text{K}) + 3.5451 \times 10^{-9} \cdot (T/\text{K}) + 1.5932 \times 10^{-6} \cdot (T/\text{K})^2$;
temp range 297–625 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$):

0.581 (calculated- C_W/C_A , Hine & Mookerjee 1975)

2.48, 2.37 (calculated-group contribution, bond contribution, Hine & Mookerjee 1975)

0.281 (calculated-P/C, Howard 1993)

0.278 (correlated-molecular structure, Russell et al. 1992)

0.446 (wetted-wall column-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.23 (shake flask-AS, Hansch & Anderson 1967, Hansch et al. 1968; Leo et al. 1971; Hansch & Leo 1979)

1.36 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)

1.23 (recommended, Sangster 1989, 1993)

1.23 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

5.18 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

0.708 (estimated- K_{OW} , Lyman et al. 1990)

0.176 (estimated-S, Lyman et al. 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

2.045 (soil, estimated- K_{OW} , Lyman et al. 1990; quoted, Howard 1993)

1.114 (soil, estimated-S, Lyman et al. 1990; quoted, Howard 1993)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} \sim 145$ d estimated from a model environmental pond with the consideration of the effect of adsorption (USEPA 1987; quoted, Howard 1993);

based on the Henry's law constant, $t_{1/2} \sim 13.3$ d from a model river of 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s at 25°C (Lyman et al. 1990; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 17.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with OH radical concentration of 5×10^5 per cm^3 in air at 25°C corresponds to an atmosphere $t_{1/2} = 22$ h (Atkinson 1987; quoted, Howard 1993)

Hydrolysis:

Biodegradation: average rate of biodegradation $k = 28.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 22$ h, based on estimated reaction rate constant of 17.4×10^{-12} cm³ molecule⁻¹ s⁻¹ for the vapor phase reaction with 5×10^5 hydroxyl radical per cm³ in air at 25°C (Howard 1993).

11.1.1.18 Benzyl alcohol

Common Name: Benzyl alcohol

Synonym: benzenemethanol, (hydroxymethyl)benzene, *o*-hydroxy toluene, phenylcarbinol, phenylmethanol

Chemical Name: benzyl alcohol

CAS Registry No: 100-51-6

Molecular Formula: C_7H_8O , $C_6H_5CH_2OH$

Molecular Weight: 108.138

Melting Point ($^{\circ}C$):

−15.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

205.31 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.04535, 1.04156 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955)

1.04127 ($25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

103.5 (calculated-density, Rohrschneider 1973)

125.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

48.13, 61.42 (normal bp, $25^{\circ}C$, Dreisbach 1955)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.406 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

38020 (Seidell 1941)

34200 (estimated, McGowan 1954)

38000 (20 – $25^{\circ}C$, shake flask-GC, Urano et al. 1982)

35000 ($20^{\circ}C$, Verschueren 1983)

42900 (shake flask-LSC, Banerjee 1985)

43000* ($20.1^{\circ}C$, shake flask-GC/TC, measured range 0 – $50^{\circ}C$, Stephenson & Stuart 1986)

46070 (shake flask-GC, Li et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($60.9^{\circ}C$, static method, measured range 60.9 – $152.1^{\circ}C$, Kahlbaum 1898)

26.7* ($38.8^{\circ}C$, ebulliometry, measured range 38.8 – $151.6^{\circ}C$, Gardner & Brewer 1937)

15.40* (extrapolated-regression of tabulated data, temp range 58 – $205.7^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.90550 - 2187.8/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

6287* ($122.52^{\circ}C$, ebulliometry, measured range 122.52 – $205.41^{\circ}C$, Dreisbach & Shrader 1949)

19.59 (calculated by formula, Dreisbach 1955)

$\log(P/mmHg) = 7.58200 - 1904.3/(200.0 + t/^{\circ}C)$; temp range 112 – $330^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

12.0 (Hoy 1970)

$\log(P/mmHg) = [-0.2185 \times 14093.2/(T/K)] + 9.391874$; temp range 58 – $204.7^{\circ}C$ (Antoine eq., Weast 1972–73)

8.35*, 10.06 ($20^{\circ}C$, $25^{\circ}C$, extrapolated-Antoine eq., gas-saturation method, Grayson & Fosbraey 1982)

$\log(P/Pa) = 29.0 - 7958/(T/K)$; temp range 29.5 – $60.1^{\circ}C$ (Antoine eq., gas saturation, Grayson & Fosbraey 1982)

4.750 (extrapolated-Cox eq., Chao et al. 1983)

- $\log (P/\text{mmHg}) = [1 - 479.624/(T/K)] \times 10^4 \{ 1.02742 - 6.26739 \times 10^{-4} \cdot (T/K) + 1.28791 \times 10^{-7} \cdot (T/K)^2 \}$; temp range 340.95–463.65 K (Cox eq., Chao et al. 1983)
 12.07, 9.69 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.34897 - 1650.313/(174.623 + t/^{\circ}\text{C})$; temp range 122.5–205.4°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.39383 - 1655.003/(171.85 + t/^{\circ}\text{C})$; temp range 38.8–151.6°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 11.72 (extrapolated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 7.19817 - 1632.593/(172.79 + t/^{\circ}\text{C})$; temp range 122–205°C (Antoine eq., Dean 1985, 1992)
 15.0 (selected, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 8.963 - 3214/(T/K)$; temp range not specified (Antoine eq., Riddick et al. 1986)
 15.25 (interpolated-Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.7069 - 1904.3/(-73.15 + T/K)$; temp range 385–573 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 8.963 - 3214/(T/K)$; temp range 293–315 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 7.395 (ebulliometry, fitted to Antoine eq., Ambrose & Ghassee 1990)
 12.0 (calculated-Wagner eq., Ambrose & Ghassee 1990)
 $\log (P/\text{mmHg}) = -36.2189 - 3.3475 \times 10^3/(T/K) + 23.337 \cdot \log(T/K) - 4.46 \times 10^{-2} \cdot (T/K) + 2.1443 \times 10^{-5} \cdot (T/K)^2$; temp range 258–677 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

- 0.0231 (quoted estimated value of Hine & Mookerjee 1975, Howard 1993)
 0.0396 (calculated-P/C, Howard 1993)
 < 0.0273 (wetted-wall column-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 1.10 (shake flask-UV, Fujita et al. 1964; Hansch et al. 1968)
 1.10 ± 0.02 (shake flask-UV, Iwasa et al. 1965)
 1.10 (shake flask-UV, Hansch et al. 1968)
 1.10 (shake flask-RC, Cornford 1982)
 1.00 (shake flask-UV, Mayer et al. 1982)
 1.16 ± 0.02 (exptl.-ALPM, Garst & Wilson 1984)
 1.06 (HPLC-k' correlation, Eadsforth 1986)
 1.58 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 1.05 (RP-HPLC-RT correlation, ODS column with masking agent, Bechalany et al. 1989)
 1.05 (recommended, Sangster 1989, 1993)
 1.22 (centrifugal partition chromatography CPC-RV, El Tayar et al. 1991)
 0.96 (calculated-UNIFAC activity coefficients, Dallos et al. 1993)
 1.10 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 0.602 (calculated- K_{ow} , Lyman et al. 1982; quoted, Howard 1993)

Sorption Partition Coefficient, $\log K_{oc}$:

- 1.193 (red-brown Australian soil with 1.09% organic carbon, Briggs 1981; quoted, Howard 1993)
 0.790 (calculated- K_{ow} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} = 97$ d for a model river of 1 m deep, flowing at 1 m/s with wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} = 22.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 7.99 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, estimated from Atmospheric Oxidation Program; $k_{\text{OH}}(\text{exptl}) = 22.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; and $k_{\text{OH}}(\text{calc}) = 7.98 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, estimated from Fate of Atmospheric Pollutants Program, (Meylan & Howard 1993)

$k_{\text{OH}}(\text{calc}) = 0.85 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{exptl}) = 22.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (SAR structure-activity relationship, Kwok & Atkinson 1995)

Hydrolysis:

Biodegradation: biodegradation rate constant $k = 0.042\text{--}0.062 \text{ h}^{-1}$ in 30 mg L^{-1} activated sludge after a lag time of 5–15 h (Urano & Kato 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: the estimated $t_{1/2} \sim 2 \text{ d}$ for the vapor-phase reaction with photochemically produced hydroxyl radical in the atmosphere (Atkinson 1985; quoted, Howard 1993).

Surface water:

Groundwater:

Sediment:

Soil:

Biota:

Cyclohexanol	108-93-0	C ₆ H ₁₁ OH	100.158	25.93	160.84	1	104.07	125.6
Benzyl alcohol	100-51-6	C ₇ H ₇ OH	108.138	-15.4	205.31	1	103.85	125.6

TABLE 11.2.2
Summary of selected physical-chemical properties of alcohols at 25°C

Compound	Selected properties				log K _{OW} calcd P/C	Henry's law constant H/(Pa·m ³ /mol)		
	Solubility		Vapor pressure			exptl (a)	exptl (b)	exptl (c)
	S/(g/m ³)	C _L /(mol/m ³)	P _L /Pa					
Methanol	miscible	miscible	16210	−0.77		0.45		0.45
Ethanol	miscible	miscible	7800	−0.31		0.53		0.527
Propanol	miscible	miscible	2780	0.25				0.751
Isopropanol	miscible	miscible	5700	0.05				0.80
1-Butanol	74000	998.4	900	0.82	0.9014	0.80	0.892	0.80
Isobutanol	81000	1093	1500	0.76	1.3726	0.99		0.99
<i>sec</i> -Butyl alcohol	181000	2442	2300	0.61	0.9419	0.80		0.918
<i>tert</i> -Butyl alcohol	miscible	miscible	5500	0.35		1.46		1.46
1-Pentanol	22000	249.6	300	1.50	1.202	1.314		
2-Pentanol	45000	510.5	777	1.14	1.522			
1-Hexanol	6000	58.72	110	2.03	1.873	1.562	1.735	
1-Heptanol	1740	14.97	24	2.62	1.603	1.909		
1-Octanol	540	4.146	11	3.07	2.653	2.454	2.48	
1-Nonanol	130	0.9012		4.26				
1-Decanol	37	0.2338		4.57				
Ethylene glycol	miscible	miscible	12	−1.36		0.006		
Allyl alcohol	miscible	miscible	3750	0.17				
Cyclopentanol			292					
Cyclohexanol	38000	379.4	85	1.23	0.224			
Benzyl alcohol	80	0.7398	12	1.10	16.22

TABLE 11.2.3
Suggested half-life classes of alcohols in various environmental compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Methanol	4	3	3	4
Ethanol	3	3	3	4
Propanol (<i>n</i> -Propyl alcohol)	3	3	3	4
Isopropanol (<i>i</i> -Propyl alcohol)	3	3	3	4
1-Butanol (<i>n</i> -Butyl alcohol)	3	3	3	4
Isobutanol (<i>i</i> -Butyl alcohol)	3	3	3	4
<i>tert</i> -Butyl alcohol	4	4	4	5
1-Pentanol (<i>n</i> -Amyl alcohol)	3	3	3	4
1-Hexanol	3	3	3	4
1-Octanol (<i>n</i> -Octyl alcohol)	3	3	3	4
Ethylene glycol	3	3	3	4
Allyl alcohol	3	3	3	4
Cyclohexanol	3	3	3	4
Benzyl alcohol	3	3	3	4

where,

Class	Mean half-life (hours)	Range (hours)
1	5	< 10
2	17 (~ 1 day)	10–30
3	55 (~ 2 days)	30–100
4	170 (~ 1 week)	100–300
5	550 (~ 3 weeks)	300–1,000
6	1700 (~ 2 months)	1,000–3,000
7	5500 (~ 8 months)	3,000–10,000
8	17000 (~ 2 years)	10,000–30,000
9	~ 5 years	> 30,000

12.1 LIST OF CHEMICALS AND DATA COMPILATIONS

12.1.1 ALDEHYDES

12.1.1.1 Methanal (Formaldehyde)

Common Name: Formaldehyde

Synonym: formalin, methanal, oxomethane

Chemical Name: formaldehyde

CAS Registry No: 50-00-0

Molecular Formula: CH₂O, HCHO

Molecular Weight: 30.026

Melting Point (°C):

-92.0 (Weast 1982–83; Dean 1985; Lide 2003)

Boiling Point (°C):

-19.1 (Lide 2003)

Density (g/cm³):

0.815 (-20°C, Weast 1982–83)

0.815 (-20°C, Verschueren 1983; Dean 1985)

Molar Volume (cm³/mol):

36.8 (-20°C, Stephenson & Malanowski 1987)

29.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):Entropy of Fusion, ΔS_{fus} (J/mol K):Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K.), F: 1.0Water Solubility (g/m³ or mg/L at 25°C):

1220000 (Dean 1985)

very soluble, up to 55% (Budavari 1989, Howard 1989)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

88566* (-22.29°C, static method-differential manometer, measured range -109.39 to -22.29°C, Spencer & Wild 1935)

101325* (-19.5°C, summary of literature data, temp range -88 to -19.5°C, Stull 1947)

log (P/mmHg) = [-0.2185 × 5917.9/(T/K)] + 7.985746; temp range -88 to -19.5°C (Antoine eq., Weast 1972–73)

1333 (-88°C, Verschueren 1983)

log (P/kPa) = 6.32524 - 972.5/(244.329 + t/°C), temp range (Antoine eq. from reported exptl. data, Boublik et al. 1984)

log (P/mmHg) = 7.1958 - 970.65/(244.1 + t/°C); temp range -109 to -22°C (Antoine eq., Dean 1985, 1992)

log (P_L/kPa) = 6.5475 - 1062.4/(-19.92 + T/K), temp range 184–251 K (Antoine eq.-I, Stephenson & Malanowski 1987)

log (P_L/kPa) = 6.4306 - 1013.206/(-24.883 + T/K); temp range 163–251 K (Antoine eq.-II, Stephenson & Malanowski 1987)

517690 (1 atm, Howard 1989)

log (P/mmHg) = 41.9603 - 2.1355 × 10³/(T/K) - 13.765·log (T/K) + 9.568 × 10⁻³·(T/K) - 5.1101 × 10⁻¹²·(T/K)²; temp range 181–408 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.0331 (20°C, porous membrane gas-liquid equilibration system, Dong & Dasgupta 1986)

0.0169 (review, Gaffney et al. 1987)

0.0341* (gas stripping-headspace GC, measured range 15–45°C, Betterton & Hoffmann 1988)

0.0298* (gas-stripping-HPLC-UV, freshwater, measured range 10–45°C, Zhou & Mopper 1990)
 $\ln [K_H'/(M/atm)] = -6.0 + 2844/(T/K)$, temp range 10–45°C (gas stripping-HPLC measurements, freshwater, Zhou & Mopper 1990)
 $\ln [K_H'/(M/atm)] = -6.7 + 3069/(T/K)$, temp range 25–45°C (gas stripping-HPLC measurements, seawater (salinity $35 \pm 1\%$), Zhou & Mopper 1990)
 0.021 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 4.621 - 2840/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.35 (shake flask, Johnson & Piret 1948)
 -1.54 (Kenaga & Goring 1980)
 0.00 (Verschuereen 1983)
 0.35 (recommended, Sangster 1989)
 0.35 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

no bioconcentration. in fish and shrimp observed (Howard 1989)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: sunlight photolysis $t_{1/2} = 1.25$ – 6.0 h, based on measured gas-phase photolysis by simulated sunlight (Calvert et al. 1972; Su et al. 1979; quoted, Howard et al. 1991);
 rate constant $k = 8.0 \times 10^{-5} \text{ s}^{-1}$ in the atmosphere (Carrier et al. 1986);
 calculated lifetime of 4 h (Atkinson 2000).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or Arrhenius equation see reference:

$k_{OH} = 1.4 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (discharge flow system-MS, Morris & Niki 1971)

aqueous photooxidation $t_{1/2} = 4813$ – 190000 h, based on measured rate constant for the reaction with OH radical in water (Dorfman & Adams 1973; quoted, Howard et al. 1991)

$k_{OH} = 1.5 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (long-path Fourier transform IR, Niki et al. 1978)

$k_{NO_3} = 3.2 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 ± 1 K (review, Atkinson & Lloyd 1984)

$k = (0.1 \pm 0.03) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2.0–6.0 and 20–23°C (Hoigné & Bader 1983)

$k_{HO_2} = 4.5 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with HO_2 radical at 298 K (review, Baulch et al. 1984; quoted, Carrier et al. 1986)

$k_{OH} = 1.1 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (review, Baulch et al. 1984; quoted, Carrier et al. 1986)

$k_{OH}(\text{calc}) = 7.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 9.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

atmospheric photooxidation half-life of 7.13–71.3 h, based on measured rate constant for the vapor-phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991)

$k_{OH}^* = 9.77 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{NO_3} = 5.8 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1991)

$k_{OH}(\text{calc}) = 17.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: no hydrolyzable group (Howard et al. 1991).

Biodegradation: degradation complete in 20 h under aerobic conditions and 48 h under anaerobic conditions in a die-away test using water from a stagnant lake (Howard 1989)

aqueous aerobic half-life of 24–168 h, based on unacclimated aqueous aerobic biodegradation screening test data; aqueous anaerobic half-life of 96–672 h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environmental Compartments:

Air: half-life is a few hours in the sunlit troposphere; $t_{1/2} = 19$ and 50 h by dry deposition and wet removal, respectively; $t_{1/2} = 12$ d when reacts with NO_3 radical by H-atom abstraction. (Howard 1989)

photooxidation $t_{1/2} = 7.13\text{--}71.3$ h, based on measured rate constant for the vapor-phase reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991);

$t_{1/2} = 1.26\text{--}6.0$ h, based on photolysis half-life in air (Howard et al. 1991);

atmospheric transformation lifetime was estimated to be 1 to 5 d (Kelly et al. 1994);

calculated lifetimes of 1.2 d, 80 d and > 4.5 yr for reactions with OH radical, NO_3 radical and O_3 , respectively (Atkinson 2000).

Surface water: $t_{1/2} = 24\text{--}168$ h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 48\text{--}336$ h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

12.1.1.2 Ethanal (Acetaldehyde)

Common Name: Acetaldehyde

Synonym: acetic aldehyde, aldehyde, ethanal, ethylaldehyde

Chemical Name: acetaldehyde, ethanal

CAS Registry No: 75-07-0

Molecular Formula: C_2H_4O , CH_3CHO

Molecular Weight: 44.052

Melting Point ($^{\circ}C$):

−123.37 (Lide 2003)

Boiling Point ($^{\circ}C$):

20.1 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.7834 ($18^{\circ}C$, Lide 2003)

Molar Volume (cm^3/mol):

56.23 ($18^{\circ}C$, calculated-density)

51.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

−10.2 (pK_b , Riddick et al. 1986)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

3.243 (Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Palit 1947; Riddick et al. 1986)

miscible (Verschueren 1983; Dean 1985)

miscible (Yaws et al. 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

101300* ($20.2^{\circ}C$, summary of literature data, temp range -81.5 to $5.9^{\circ}C$, Stull 1947)

102125* ($20.7^{\circ}C$, measured range -0.20 to $34.4^{\circ}C$, Coles & Popper 1950)

120060 (Hoy 1970)

$\log(P/\text{mmHg}) = [-0.2185 \times 7267.8/(T/K)] + 8.327803$; temp range -81.5 to $20.2^{\circ}C$ (Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 6622.1/(T/K)] + 7.82060$; temp range -24.3 to $27.5^{\circ}C$ (Antoine eq., Weast 1972–73)

98640 ($20^{\circ}C$, Verschueren 1983)

102125, 120220 ($20.7^{\circ}C$, quoted exptl., interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/\text{kPa}) = 7.14122 - 1606.85/(292.482 + t/^{\circ}C)$, temp range: -0.2 to $34.3^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

120230 (calculated-Antoine eq., Dean 1985, 1992)

$\log(P/\text{mmHg}) = 8.00552 - 1600.017/(291.809 + t/^{\circ}C)$, temp range: liquid (Antoine eq., Dean 1985, 1992)

121300 (selected, Riddick et al. 1986)

$\log(P/\text{kPa}) = 6.1814 - 1070.6/(236.0 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

120700 (interpolated-Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.1410 - 1034.5/(-43.15 + T/K)$; temp range 272 – 294 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.03292 - 1012.828/(-41.823 + T/K)$; temp range 293 – 377 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P/\text{mmHg}) = 87.3702 - 3.6822 \times 10^3/(T/K) - 31.548 \cdot \log(T/K) + 2.0114 \times 10^{-2} \cdot (T/K) + 5.5341 \times 10^{-13} \cdot (T/K)^2$; temp range 150 – 461 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 6.692 (shake flask-concentration ratio-GC, Buttery et al. 1969)
- 8.924 (calculated K_{AW} s, Buttery et al. 1969)
- 6.672 (exptl., Hine & Mookerjee 1975)
- 5.946, 5.423 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
- 1.336, 8.0 (0, 25°C, gas stripping-GC, Snider & Dawson 1985)
- 6.75 (review, Gaffney et al. 1987)
- 2.578* (gas stripping-headspace GC, measured range 15–35°C, Betterton & Hoffmann 1988)
- 6.80* (gas-stripping-HPLC-UV, measured range 10–45°C, Zhou & Mopper 1990)
- $\ln [K_{\text{H}}'/(M/\text{atm})] = -6.03 + 276/(T/K)$, temp range 10–45°C (gas stripping-HPLC measurements, freshwater, Zhou & Mopper 1990)
- $\ln [K_{\text{H}}'/(M/\text{atm})] = -5.21 + 1984/(T/K)$, temp range 10–45°C (gas stripping-HPLC measurements, seawater (salinity $35 \pm 1\text{‰}$), Zhou & Mopper 1990)
- 10.18 (calculated-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
- 5.47* (20°C, headspace-GC, measured range 10–40°C, Benkelberg et al. 1995)
- 8.72* (headspace-GC, artificial seawater, measured range 16–40°C, Benkelberg et al. 1995)
- $\ln (k_{\text{H}}/\text{atm}) = (20.4 \pm 0.1) - (5671 \pm 22)/(T/K)$; temp range 10–40°C (headspace-GC measurements, Benkelberg et al. 1995)
- 5.14 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
- 6.33 (solid-phase microextraction SPME-GC, Bartelt 1997)
- 6.69 (equilibrium headspace-GC, Marin et al. 1999)
- 5.39 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
- $\log K_{\text{AW}} = 5.324 - 2340/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 0.52 (generator column-HPLC, Wasik et al. 1981)
- 0.36 (generator column-GC, Tewari et al. 1982)
- 0.43 (calculated, Verschueren 1983)
- 0.45 (recommended, Sangster 1989, 1993)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constant $k = 2.3.0 \times 10^{-5} \text{ s}^{-1}$ in the atmosphere (Carlier et al. 1986);
calculated lifetime of 6 d (Atkinson 2000)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and or Arrhenius equation see reference:

$k_{\text{OH}} = 1.53 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (discharge flow system-MS, Morris & Niki 1971)

$k_{\text{OH}} = 1.6.2 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (long-path Fourier transform IR, Niki et al. 1978)

$k = 0.1 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radical at 30°C in aquatic systems with half-life of $8 \times 10^4 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982)

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with half-life $> 00 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{\text{OH}} = (12.8 \pm 4.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Kerr & Sheppard 1981; quoted, Atkinson 1985)

$k = (1.5 \pm 0.2) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2.0–6.0 and 20–23°C (Hoigné & Bader 1983)

$k_{\text{OH}} = (12.2 \pm 2.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Semmes et al. 1985; quoted, Atkinson 1985)

$k_{\text{O}_3} = (3.4 \pm 0.5) \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (Stedman & Niki 1973; quoted, Atkinson & Carter 1984)

$k_{\text{OH}} = 9.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 K (Lyman 1982)

$k_{\text{O}_3} \leq 6 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ $296 \pm 2 \text{ K}$ (Atkinson et al. 1981, 1982; quoted, Atkinson & Carter 1984; Atkinson 1985)

$k_{\text{HO}_2} = 1.0 \times 10^{-17} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ for the gas-phase reaction with HO_2 radical at 293 K in the atmosphere (Barnes et al. 1982; quoted, Carlier et al. 1986)

$k_{\text{OH}} = 1.62 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$; and $k_{\text{NO}_3} = 3.02 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K in air (Atkinson et al. 1984)

$k_{\text{NO}_3} = 1.40 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ $298 \pm 1 \text{ K}$ (review, Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)

$k_{\text{OH}} = 1.60 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (review, Baulch et al. 1984; quoted, Carlier et al. 1986)

$k_{\text{OH}} = (14.7 \pm 2.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Michael et al. 1985; quoted, Atkinson 1985)

$k_{\text{OH}}(\text{calc}) = 1.62 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.62 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{\text{OH}} = 1.6 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 0.7 d^{-1} , $k_{\text{O}_3} \leq 6.0 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of $\leq 0.0004 \text{ d}^{-1}$, $k_{\text{NO}_3} = 2.5 \times 10^{-15} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 0.05 d^{-1} (review, Atkinson 1985)

$k_{\text{OH}}^* = 1.53 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}} = 16.22 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{NO}_3} = 3.02 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Sabljic & Güsten 1990; Müller & Klein 1991)

$k_{\text{NO}_3} = 2.78 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1991)

$k_{\text{OH}} = 10.64 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} < 0.24 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

atmospheric transformation lifetime was estimated to be $< 1 \text{ d}$ (Kelly et al. 1994);

calculated lifetimes of 8.8 h, 17 d and $> 4.5 \text{ yr}$ for reactions with OH radical, NO_3 radical and O_3 , respectively (Atkinson 2000).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

TABLE 12.1.1.2.1

Reported vapor pressures of ethanal (acetaldehyde) at various temperatures and the coefficients for the vapor pressure equations

$\log P = A - B/(T/K)$	(1)	$\ln P = A - B/(T/K)$	(1a)
$\log P = A - B/(C + t/^{\circ}\text{C})$	(2)	$\ln P = A - B/(C + t/^{\circ}\text{C})$	(2a)
$\log P = A - B/(C + T/K)$	(3)		
$\log P = A - B/(T/K) - C \cdot \log (T/K)$	(4)

12.1.1.3 Propanal (Propionaldehyde)

Common Name: Propionaldehyde

Synonym: propanal

Chemical Name: propionaldehyde, propanal

CAS Registry No: 123-38-6

Molecular Formula: C_3H_6O , CH_3CH_2CHO

Molecular Weight: 58.079

Melting Point ($^{\circ}C$):

−80 (Lide 2003)

Boiling Point ($^{\circ}C$):

48 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8058 (Weast 1982–83)

0.7970 (Riddick et al. 1986)

Molar Volume (cm^3/mol):

72.9 (calculated-density, Stephenson & Malanowski 1987)

74.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

Entropy of Fusion ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

160000 ($20^{\circ}C$, Seidell 1941)

200000 ($20^{\circ}C$, Verschueren 1983)

306000 (Dean 1985; Riddick et al. 1986)

405000 (selected, Yaws et al. 1990)

310000*, 269000 ($20^{\circ}C$, $30^{\circ}C$, shake flask-GC/TC, measured range 12.3 – $50^{\circ}C$, Stephenson 1993)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

67661* ($39.07^{\circ}C$, ebulliometry, measured range 39.07 – $50.29^{\circ}C$, Dreisbach & Shrader 1949)

$\log(P/mmHg) = 7.08683 - 1178.9/(230 + t/^{\circ}C)$; temp range not specified (Antoine eq., Dreisbach & Martin 1949)

42300* ($23^{\circ}C$, measured range 13.1 – $48.06^{\circ}C$, Ambrose & Sprake 1974)

42340 (interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.2902 - 1210.87/(234.65 + t/^{\circ}C)$, temp range 13.1 – $48.06^{\circ}C$ (Antoine eq. from reported exptl. data of Ambrose & Sprake 1974, Boublik et al. 1984)

42490, 42360 (interpolated-Antoine eq. I and II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.2047 - 1166.99/(-43.15 + T/K)$; temp range 290–322 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.2336 - 1180/(-42.0 + T/K)$; temp range 250–330 K (Antoine eq.-II, Stephenson & Malanowski 1987)

23190 (calculated-solvatochromic parameters, Banerjee et al. 1990)

$\log(P/mmHg) = 26.1637 - 2.3059 \times 10^3/(T/K) - 6.5289 \cdot \log(T/K) - 2.3065 \times 10^{-10} \cdot (T/K) + 2.5454 \times 10^{-6} \cdot (T/K)^2$; temp range 193–496 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

7.436 (shake flask, partial vapor pressure-GC, Buttery et al. 1969)

7.486 (exptl., Hine & Mookerjee 1975)

- 8.40, 8.21 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 8.305* (gas stripping-HPLC/UV, measured range 10–45°C, Zhou & Mopper 1990)
 $\ln [K_H'/(M/atm)] = -7.15 + 2467/(T/K)$, temp range 10–45°C (gas stripping-HPLC measurements, freshwater, Zhou & Mopper 1990)
 $\ln [K_H'/(M/atm)] = -6.60 + 2273/(T/K)$, temp range 25–35°C (gas stripping-HPLC measurements, seawater (salinity 35 ± 11), Zhou & Mopper 1990)
 7.486, 13.62 (quoted, correlated-molecular structure, Russell et al. 1992)
 5.48 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 5.324 - 2237/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 0.83 (calculated, Verschueren 1983)
 0.59 (shake flask, Log P Database, Hansch & Leo 1987)
 0.59 (recommended, Sangster 1989)
 0.59 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 3.02 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constant $k = 3.2 \times 10^{-5} \text{ s}^{-1}$ in the atmosphere (Carlier et al. 1986).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 3.06 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (discharge flow system-MS, Morris & Niki 1971)

photooxidation $t_{1/2} < 0.24 \text{ h}$ for the gas-phase reaction with OH radicals in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976)

$k_{OH} = 2.1 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (long-path Fourier transform IR, Niki et al. 1978)

$k_{OH} = (18.5 \pm 2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Audley et al. 1981; quoted, Atkinson 1985),

$k_{OH} = (19.5 \pm 1.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Kerr & Sheppard 1981; quoted, Atkinson 1985)

$k = (2.5 \pm 0.4) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2.0–6.0 and 20–23°C (Hoigné & Bader 1983)

$k_{OH} = 1.8 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (review, Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)

$k_{OH} = (17.1 \pm 2.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Semmes et al. 1985; quoted, Atkinson 1985)

$k_{OH}(\text{calc}) = 2.2 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 1.96 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

photooxidation $t_{1/2} = 3.3\text{--}33 \text{ h}$ in air, based on measured reaction rate constant for the vapor-phase reaction with hydroxyl radical in air (Atkinson 1987; selected, Howard et al. 1991)

$k_{OH} = 1.96 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH}(\text{calc}) = 16.55 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: no hydrolyzable groups (Howard et al. 1991).

Biodegradation: biodegradation rate constants $k = 0.046\text{--}0.063 \text{ h}^{-1}$ in 30 mg/L activated sludge after a time lag of 5 h (Urano & Kato 1986b); aqueous aerobic $t_{1/2} = 24\text{--}168 \text{ h}$, based on aerobic biological screening test data (Gerhold & Malaney 1966; Dore et al. 1975; Urano & Kato 1986; selected, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 96\text{--}672 \text{ h}$, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} < 0.24 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photooxidation $t_{1/2}$ = 3.3–33 h in air, based on measured reaction rate constant for the vapor-phase reaction with hydroxyl radical in air (Atkinson 1987; selected, Howard et al. 1991).
Surface water: $t_{1/2}$ = 24–168 h, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).
Ground water: $t_{1/2}$ = 48–336 h, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).
Sediment:
Soil: $t_{1/2}$ = 24–168 h, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).

12.1.1.4 Butanal (*n*-Butyraldehyde)

Common Name: *n*-Butyraldehyde

Synonym: 1-butanal, butylaldehyde, butyric aldehyde

Chemical Name: butyraldehyde, butanal

CAS Registry No: 123-72-8

Molecular Formula: C_4H_8O , $CH_3CH_2CH_2CHO$

Molecular Weight: 72.106

Melting Point ($^{\circ}C$):

−96.86 (Lide 2003)

Boiling Point ($^{\circ}C$):

74.8 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8170 (Weast 1982–83; Verschueren 1983)

0.8016 (Dean 1985; Riddick et al. 1986)

Molar Volume (cm^3/mol):

90.0 ($20^{\circ}C$, calculated-density)

96.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

11.088 (Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

36000 ($20^{\circ}C$, quoted, Palit 1947)

37840 (Deno & Berkheimer 1960)

37000, 71000 (lit. values, Verschueren 1983)

71000 (Dean 1985; Riddick et al. 1986)

83700 (selected, Yaws et al. 1990)

74400*, 54800 ($20^{\circ}C$, $30^{\circ}C$, shake flask-GC/TC, measured range 0 – $70^{\circ}C$, Stephenson 1993)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

19372* ($30.71^{\circ}C$, measured range 30.71 – $74.03^{\circ}C$, Seprakova et al. 1959; quoted, Boublik et al. 1984)

9464 ($20^{\circ}C$, Verschueren 1983)

14798 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 5.52728 - 921.802/(186.564 + t/^{\circ}C)$; temp range 30.71 – $74.03^{\circ}C$ (Antoine eq. from reported exptl. data of Seprakova et al. 1959, Boublik et al. 1984)

14785 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 6.91048 - 946.35/(246.68 + t/^{\circ}C)$; temp range -87 to $7^{\circ}C$ (Antoine eq., Dean 1985, 1992)

15700 (selected, Riddick et al. 1986)

$\log(P/kPa) = 6.1461 - 1233.0/(223.0 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

14780 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.68618 - 994.1/(-78.05 + T/K)$; temp range 293 – 349 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.40874 - 1182.472/(T/K)$; temp range 348 – 423 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P/mmHg) = 66.8411 - 3.6784 \times 10^3/(T/K) - 22.609 \cdot \log(T/K) + 1.1697 \times 10^{-2} \cdot (T/K) + 2.9647 \times 10^{-13} \cdot (T/K)^2$; temp range 177 – 525 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

11.65 (shake flask, partial vapor pressure-GC, Buttery et al. 1969)

11.59, 11.594, 12.14 (exptl., calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

11.65 (gas stripping-HPLC, Zhou & Mopper 1990)

3.237, 11.65, 15.59, 20.68, 36.19 (10, 25, 30, 35, 45°C, gas-stripping-HPLC-UV, Zhou & Mopper 1990)

$\ln [K_H'/(M/\text{atm})] = -8.07 + 2701/(T/K)$; temp range 10–45°C (gas stripping-HPLC measurements, freshwater, Zhou & Mopper 1990)

$\ln [K_H'/(M/\text{atm})] = -8.20 + 2698/(T/K)$; temp range 10–45°C (gas stripping-HPLC measurements, seawater (salinity 35 ± 11), Zhou & Mopper 1990)

11.59, 11.59 (quoted, correlated-molecular structure, Russell et al. 1992)

7.26 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)

$\log K_{AW} = 6.244 - 2571/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.20 (Hansch & Leo 1979)

0.88 (shake flask, Log P Database, Hansch & Leo 1987)

0.88 (recommended, Sangster 1989)

0.88 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.39 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constant $k = 2.7 \times 10^{-5} \text{ s}^{-1}$ in the atmosphere (Carlier et al. 1986)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or Arrhenius expression see reference:

photooxidation $t_{1/2} = 114 \text{ d}$ to 19 yr in water, based on measured rate constant for the reaction with OH radical in water (Anbar & Neta 1967; Dorfman & Adams 1973; selected, Howard et al. 1991)

$k_{OH} = (26.2 \pm 3.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (relative rate method, Audley et al. 1981; quoted, Atkinson 1985)

$k_{OH} = (25.3 \pm 0.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (relative rate method, Kerr & Sheppard 1981; quoted, Atkinson 1985)

$k_{OH} = 25 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)

$k = (2.5 \pm 0.4) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2.0–6.0 and 20–23°C (Hoigné & Bader 1983)

$k_{OH} = (30.8 \pm 4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-resonance fluorescence technique. Semmes et al. 1985; quoted, Atkinson 1985)

$k_{OH}(\text{calc}) = 2.55 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 2.3 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

photooxidation $t_{1/2} = 2.8\text{--}28 \text{ h}$ in air, based on measured rate constant for the gas-phase reaction with OH radical in air (Atkinson 1987; selected, Howard et al. 1991)

$k_{OH}^* = 2.35 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Hydrolysis:

Biodegradation: rate constants $k = 0.044\text{--}0.069 \text{ h}^{-1}$ in 30 mg/L activated sludge after a time lag of 5 h (Urano & Kato 1986b);

aqueous aerobic $t_{1/2} = 24\text{--}168$ h, based on aerobic biological screening test data (Lamb & Jenkins 1952; Heukelekian & Rand 1955; Dore et al. 1975; Urano & Kato 1986b; selected, Howard et al. 1991);
 aqueous anaerobic $t_{1/2} = 96\text{--}672$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 2.8\text{--}28$ h, based on measured rate constant for the gas-phase reaction with OH radical in air (Atkinson 1987; selected, Howard et al. 1991);
 calculated lifetimes of 5.9 d for reaction with OH radical (Atkinson 2000).

Surface water: photooxidation $t_{1/2} = 114$ d to 19 yr, based on measured rate constant for the reaction with OH radical in water (Anbar & Neta 1967; Dorfman & Adams 1973; selected, Howard et al. 1991);
 $t_{1/2} = 24\text{--}168$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 48\text{--}336$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

12.1.1.5 2-Propenal (Acrolein)

Common Name: Acrolein

Synonym: 2-propenal, acraldehyde, acrylic aldehyde, allylaldehyde, acrylaldehyde, aqualin

Chemical Name: 2-propenal

CAS Registry No: 107-02-8

Molecular Formula: C_3H_4O , $CH_2=CHCHO$

Molecular Weight: 56.063

Melting Point ($^{\circ}C$):

−87.7 (Lide 2003)

Boiling Point ($^{\circ}C$):

52.6 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8389 (Riddick et al. 1986)

Dissociation Constant:

Molar Volume (cm^3/mol):

66.8 ($20^{\circ}C$, calculated-density)

66.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

208000 ($20^{\circ}C$, Günther et al. 1968; Callahan et al. 1979; Verschueren 1977, 1983)

102020 (shake flask-radioactive analysis, Veith et al. 1980)

208000 (selected, Riddick et al. 1986)

229000*, 230000 ($20^{\circ}C$, $30^{\circ}C$, shake flask-GC/TC, measured range $0-53^{\circ}C$, Stephenson 1993)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

26664* ($17.5^{\circ}C$, summary of literature data, temp range -64.5 to $52.5^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 7628.8/(T/K)] + 8.033866$; temp range: -64.5 to $52.5^{\circ}C$, (Antoine eq., Weast 1972–73)

29330, 44000 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1977, 1983)

35300 (Riddick et al. 1986, Howard 1989)

36610, 35360 (interpolated-Antoine eq.-I and II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.19181 - 1204.95/(-37.8 + T/K)$; temp range 208–326 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.2878 - 1231.003/(-38.405 + T/K)$; temp range 250–306 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P/mmHg) = 57.9815 - 3.0933 \times 10^3/(T/K) - 19.638 \cdot \log(T/K) + 1.1486 \times 10^{-2} \cdot (T/K) - 2.3854 \times 10^{-14} \cdot (T/K)^2$; temp range 185–506 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.84, 13.77 (0 , $25^{\circ}C$, headspace-GC, Snider & Dawson 1985)

12.36 (review, Gaffney et al. 1987)

0.446 (Howard 1989)

5.48 ($20^{\circ}C$, selected from literature experimentally measured data, Staudinger & Roberts 2001)

$\log K_{AW} = 4.823 - 2110/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

−0.09 (quoted, Callahan et al. 1979)

0.90 (measured value, Veith et al. 1980)

- −0.10 (shake flask, Log P Database, Hansch & Leo 1987; recommended, Sangster 1993)
 −0.01 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 2.54 (bluegill sunfish, Barrows et al. 1980)
 2.54 (bluegill sunfish, Veith et al. 1980)
 −0.22 (estimated- K_{OW} , Howard 1989)

Sorption Partition Coefficient, $\log K_{OC}$:

- 1.38 (estimated- K_{OW} , Howard et al. 1989)
 −0.219 (calculated- K_{OW} , Kolliig 1993)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 10$ d from a model river (Howard 1989);

Photolysis: $t_{1/2} = 3.5$ d, based on measured quantum yields (Howard 1989).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{O_3} = 6.4 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Atkinson & Carter 1984)

$k_{OH} = (1.90 - 2.53) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in air (Atkinson 1985)

$k_{OH} = 20.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 23.5°C using propylene as reference compound, with a atmospheric lifetime of 0.56 d (Edney et al. 1986)

$k_{NO_3} = 5.9 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated atmospheric lifetime of 16 d, $k_{OH} = 2.0 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a lifetime of 1.2 d; and $k_{O_3} = 2.8 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a lifetime of 59 d at room temp. (Atkinson et al. 1987)

$k_{OH}(\text{calc}) = 2.29 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 1.96 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH} = 1.99 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

atmospheric $t_{1/2} = 3.4\text{--}33.7$ h, based on rate constant for reaction with OH radical (Howard et al. 1991)

$k_{OH} = 22.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{NO_3} = 1.15 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ ((Sabljić & Güsten 1990; Müller & Klein 1991)

$k_{OH}(\text{calc}) = 17.70 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: no hydrolyzable groups (Callahan et al. 1979).

Biodegradation: $t_{1/2} = 29$ h (natural unsterilized water) and $t_{1/2} = 43$ h in sterilized (thymol-treated) water (Bowmer & Higgins 1976, quoted, Howard 1989);

aqueous aerobic $t_{1/2} = 168\text{--}672$ h, based on acclimated aqueous screening test data; and aqueous anaerobic $t_{1/2} = 672\text{--}2880$ h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: $t_{1/2} < 4$ d (Callahan et al. 1979)

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environmental Compartments:

Air: atmospheric lifetime of 0.56 d due to reaction with OH radical (Edney et al. 1986);

calculated atmospheric lifetimes: 16 d for reaction with NO_3 radical, 1.2 d with OH radical and 59 d with O_3 (Atkinson et al. 1987);

$t_{1/2} = 10\text{--}13$ h for reaction with photochemically generated hydroxyl radical, $t_{1/2} = 18$ d for reaction with ozone and $t_{1/2} = 3.5$ d for photodissociation in the atmosphere (Howard 1989);

$t_{1/2} = 3.4\text{--}33.7$ h, based on photooxidation half-life in air (Howard et al. 1991);

atmospheric transformation lifetime was estimated to be < 1 d (Kelly et al. 1994).

Surface water: removal $t_{1/2} = 2.0$ to 2.5 d from water (Howard 1989);

First order $k = 0.163 \text{ h}^{-1}$ in 8 agricultural canals and varies between 0.104 and 0.211 h^{-1} at pH 7.1 to 7.5 and water temperature of 16–24°C, the mean value corresponds to $t_{1/2} = 4.25$ h at 21°C (Bowmer & Sainty 1977)

$t_{1/2} \sim 8$ and 23 d for reacting with singlet oxygen and alkylperoxy radicals in natural sunlit water (estimated, Howard 1989),

aqueous aerobic $t_{1/2}$ = 168–672 h, based on acclimated aqueous screening test data; and aqueous anaerobic $t_{1/2}$ = 672–2880 h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991)
k = 0.015 h⁻¹ at 21°C and pH 7.0, corresponding to $t_{1/2}$ = 46 h in dilute buffered solutions of acrolein in distilled water. (Nordone et al. 1996)
Dissipation k = 0.068 h⁻¹ with $t_{1/2}$ = 10.2 h and k = 0.028 h⁻¹ with $t_{1/2}$ = 7.3 h in weedy (Pump Canal, 12–20°C) and non-weedy agricultural canals (Lateral 1, 12–18°C), respectively, dissipation is the result of numerous processes including degradation, volatilization, adsorption and dilution (Nordone et al. 1996)
Ground water: $t_{1/2}$ = 336–1344 h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).
Sediment:
Soil: $t_{1/2}$ = 168–672 h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).

12.1.1.6 Furfural (2-Furaldehyde)

Common Name: Furfural

Synonym: 2-furaldehyde, 2-furancarboxaldehyde; furfurole, 2-furancarboxal, fural, furfuraldehyde, furole

Chemical Name: furfural

CAS Registry No: 98-01-1

Molecular Formula: $C_5H_4O_2$

Molecular Weight: 96.085

Melting Point ($^{\circ}C$):

−38.1 (Lide 2003)

Boiling Point ($^{\circ}C$):

161.7 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.16 (Verschuereen 1983)

Dissociation Constant:

Molar Volume (cm^3/mol):

82.9 (calculated-density, Stephenson & Malanowski 1987)

92.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

82000 ($40^{\circ}C$, synthetic method, Jones 1929)

91593 (shake flask-volumetric method, Booth & Everson 1948)

92900 ($26.7^{\circ}C$, shake flask-turbidity, Skrzec & Murphy 1954)

77830 (generator column-HPLC/UV, Tewari et al. 1982)

79400*, 84000 ($20^{\circ}C$, $30^{\circ}C$, shake flask-GC/TC, measured range 0 – $90^{\circ}C$, Stephenson 1993)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1066.6* ($39.9^{\circ}C$, ebulliometry, measured range 40 – $170.6^{\circ}C$, Evans & Aylesworth 1926)

220.4* (interpolated-regression of tabulated data, temp range 18.5 – $161.8^{\circ}C$, Stull 1947)

1767* ($55.67^{\circ}C$, Ramsay-Young method, measured range 55.6 – $170^{\circ}C$, Matthews et al. 1950)

$\log(P/mmHg) = A - B/(T/K) - C \log(T/K)$; temp range 55.6 – $170^{\circ}C$ (Kirchhoff eq., Matthews et al. 1950)

$\log(P/mmHg) = [-0.2185 \times 11614.6/(T/K)] + 8.729884$; temp range 18.5 – $161.8^{\circ}C$ (Antoine eq., Weast 1972–73)

133.3, 400 ($20^{\circ}C$, $30^{\circ}C$, Verschuereen 1983)

$\log(P/kPa) = 5.62941 - 1124.583/(148.829 + t/^{\circ}C)$, temp range 92.3 – $170.6^{\circ}C$ (Antoine eq. derived from Evans & Aylesworth 1926 data, Boublik et al. 1984)

$\log(P/kPa) = 5.76606 - 1236.745/(167.368 + t/^{\circ}C)$, temp range 55.87 – $160.8^{\circ}C$ (Antoine eq. derived from Matthews et al. 1950 data, Boublik et al. 1984)

208.0 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 6.91048 - 946.35/(246.68 + t/^{\circ}C)$, temp range -87 to $7^{\circ}C$ (Antoine eq., Dean 1985, 1992)

333.3 (Riddick et al. 1986)

313.2 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_1/kPa) = 6.41784 - 1663.16/(-57.88 + T/K)$, temp range 357 – $435 K$ (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 32.0337 - 3.3161 \times 10^3/(T/K) + 10.171 \cdot \log(T/K) - 2.1115 \times 10^{-2} \cdot (T/K) + 9.2045 \times 10^{-6} \cdot (T/K)^2$; temp range 237 – $657 K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$):

0.375 (calculated-P/C, Howard 1993)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.34	(20°C, shake flask, Korenman 1972)
0.52	(generator column-HPLC/UV, Tewari et al. 1982)
0.41, 0.52	(shake flask, Log P Database, Hansch & Leo 1987)
0.46	(recommended, Sangster 1993)
0.41	(recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:Bioconcentration Factor, $\log BCF$:

0.079	(estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1993)
-2.097	(estimated-S, Lyman et al. 1982; quoted, Howard 1993)

Sorption Partition Coefficient, $\log K_{OC}$:

1.602	(soil, estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1993)
0.00	(soil, estimated-S, Lyman et al. 1982; quoted, Howard 1993)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: based on calculated Henry's law constant, the estimated $t_{1/2} \sim 9.9$ d from a model river of one meter deep flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1993).

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation: average rate of biodegradation 41.0 mg COD $g^{-1} h^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environmental Compartments:

Air: estimated photooxidation $t_{1/2} \sim 0.44$ d for the vapor-phase reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard 1993).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

12.1.1.7 Benzaldehyde

Common Name: Benzaldehyde

Synonym: benzenecarbonal, oil of bitter almonds

Chemical Name: benzaldehyde

CAS Registry No: 100-52-7

Molecular Formula: C_7H_6O , C_6H_5CHO

Molecular Weight: 106.122

Melting Point ($^{\circ}C$):

-57.1 (Lide 2003)

Boiling Point ($^{\circ}C$):

178.8 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0401 (24.94 $^{\circ}C$, measured, Ambrose et al. 1975)

1.0447 (Dean 1985)

1.0446 (Riddick et al. 1986)

Molar Volume (cm^3/mol):

102.0 (calculated-density, Chiou 1985)

118.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

9.322 (Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} J/mol K:

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

2991 (quoted, Deno & Berkheimer 1960)

2857 (1 in 350 parts, Merck Index 1960)

3490, 3500 (quoted Ph. D. theses from University of London, Mitchell et al. 1964)

6550, 6580 (shake flask-gravimetric method, shake flask-GC/FID, Mitchell et al. 1964)

6900–7000 (shake flask-refractive index method, Carless & Swarbrick 1964)

7200 ($20^{\circ}C$, shake flask-GC, Tewari et al. 1982)

3000 (20 – $25^{\circ}C$, shake flask-GC, Urano et al. 1982)

3300 (Verschuereen 1983)

3279 (shake flask-GC, Chiou 1985)

3000 ($20^{\circ}C$, Riddick et al. 1986)

7200*, 7400 ($20^{\circ}C$, $30^{\circ}C$, shake flask-GC/TC, measured range 0 – $90^{\circ}C$, Stephenson 1993)

3514 (calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3*, 145.2 ($26.2^{\circ}C$, extrapolated-regression of tabulated data, temp range 26.2 – $179^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 11657.8/(T/K)] + 8.580362$; temp range 26.2 – $179^{\circ}C$ (Antoine eq., Weast 1972–73)

137.0* (ebulliometry-extrapolated from Antoine eq., measured range 38.5 – $89.3^{\circ}C$, Ambrose et al. 1975b)

$\log(P/kPa) = 6.20251 - 1611.217/(T/K - 67.984)$; temp range 38.5 – $89.3^{\circ}C$, mercury as reference, Ambrose et al. 1975b)

$\log(P/kPa) = 6.22556 - 1628.007/(T/K - 66.119)$; temp range 74.9 – $190.8^{\circ}C$, water as reference, Ambrose et al. 1975b)

169.0 (calculated from different vapor eq., Ambrose et al. 1975)

160.5 (extrapolated-Antoine eq., Ambrose et al. 1979)

133.3 ($26.0^{\circ}C$, Verschuereen 1983)

160.5 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.21282 - 1618.669/(205.994 + t/^{\circ}\text{C})$; temp range 38.5–208°C (Antoine eq. from reported exptl. data of Ambrose et al. 1975, Boublik et al. 1984)

169.0 (Riddick et al. 1986)

$\log (P_L/\text{kPa}) = 5.56823 - 1197.54/(-115.829 + T/\text{K})$; temp range 348–452 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 7.4764 - 2455.4/(T/\text{K})$; temp range 273–373 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.20256 - 1611.255/(-67.979 + T/\text{K})$; temp range 409–481 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.48764 - 1782.204/(-52.863 + T/\text{K})$; temp range 311–376 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.22745 - 1629.229/(-65.993 + T/\text{K})$; temp range 370–475 K (Antoine eq.-V, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 28.4711 - 3.4489 \times 10^3/(T/\text{K}) - 6.8363 \cdot \log (T/\text{K}) - 2.8173 \times 10^{-10} \cdot (T/\text{K}) + 9.5236 \times 10^{-7} \cdot (T/\text{K})^2$; temp range 247–695 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2.781, 1.494 (quoted exptl., calculated-bond contribution, Hine & Mookerjee 1975)

2.815 (Gaffney et al. 1987)

2.71* (gas stripping-GC, measured range 15–45°C, Betterton & Hoffmann 1988)

2.282* (gas-stripping-HPLC-UV, measured range 10–45°C, Zhou & Mopper 1990)

$\ln [K_H'/(M/\text{atm})] = -5.00 + 1977/(T/\text{K})$, temp range 10–45°C (gas stripping-HPLC measurements, freshwater, Zhou & Mopper 1990)

$\ln [K_H'/(M/\text{atm})] = -5.90 + 2207/(T/\text{K})$, temp range 10–45°C (gas stripping-HPLC measurements, seawater (salinity 35 ± 11), Zhou & Mopper 1990)

3.08* (EPICS-UV spectroscopy, measured range 5–25°C, Allen et al. 1998)

$\ln K_{AW} = -6759/(T/\text{K}) + 15.93$ (EPICS-UV, temp range 5–25°C, Allen et al. 1998)

1.94 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)

$\log K_{AW} = 4.665 - 2276/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.48 (Leo et al. 1971; Hansch et al. 1972)

1.45 (shake flask-UV at pH 5.62, Umeyama et al. 1971)

1.43 (shake flask-UV, Holmes & Lough 1976)

1.45 ± 0.03 (shake flask at pH 7, Unger et al. 1978)

2.33 (HPLC-RT correlation, Veith et al. 1979)

1.56 (HPLC- k' correlation, Eadsforth 1986)

1.49 (shake flask, Eadsforth 1986)

1.44 (HPLC-RT correlation average, Ge et al. 1987)

1.54 (RP-HPLC-RT correlation, ODS column with masking agent, Bechalany et al. 1989)

1.48 (recommended, Sangster 1989, 1993)

1.72 (shake flask-UV, Kramer & Henze 1990)

1.48 (shake flask-UV spec., Alcron et al. 1993)

1.48 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: loss rate $k = 3.4 \times 10^{-4} \text{ min}^{-1}$ in outdoor Teflon chambers in dark (Grosjean 1985).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or Arrhenius expression see reference:

$k < 2.0 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen in the aquatic systems at 25°C with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{\text{OH}} = 1.3 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ determined by the long-path Fourier transform IR spectroscopic method with reference to that for C_2H_4 or C_2D_4 (Niki et al. 1978)

$k_{\text{OH}} = 7.6 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C with $t_{1/2} = 0.74 \text{ d}$ (Hendry & Kenley 1979; quoted, Mill 1982)

$k_{\text{OH}} = 7.8 \times 10^{12} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 300 K (Lyman 1982)

$k = (2.5 \pm 0.5) \text{ M}^{-1} \text{ s}^{-1}$ for 2–10 mM to react with ozone in water at pH 1.7 and $20\text{--}23^\circ\text{C}$ (Hoigné & Bader 1983)

$k_{\text{NO}_3} = < 9.6 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $300 \pm 1 \text{ K}$ (using relative rate technique to propene Carter et al. 1981; quoted, Atkinson 1991)

$k_{\text{NO}_3} = (2.55 \pm 0.08) \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 294 K (Atkinson et al. 1984; quoted, Atkinson 1991)

$k_{\text{NO}_3} = (1.13 \pm 0.25) \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, compared to a previous measured value $k_{\text{NO}_3} < 5.2 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ (relative rate technique, Atkinson et al. 1984)

$k_{\text{OH}} = .2 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)

$k_{\text{NO}_3} = 2.0 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (reevaluated value, Atkinson et al. 1987)

$k_{\text{OH}}(\text{exptl}) = 1.30 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = 1.698 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (SAR, Atkinson 1987, 1990; quoted, Sabljic & Güsten 1990; Müller & Klein 1991)

$k_{\text{NO}_3} = 2.54 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson et al. 1988; quoted, Sabljic & Güsten 1990; Müller & Klein 1991)

$k_{\text{OH}} = 1.29 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 11.40 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation: average rate of biodegradation $119.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976),

biodegradation rate constant $k = 0.065\text{--}0.074 \text{ h}^{-1}$ in 30 mg/L activated sludge after a lag time of 5–10 h (Urano & Kato 1986b).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} > 9.9 \text{ d}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

$t_{1/2} = 0.74 \text{ d}$ based on rate constants for oxidation by OH radical in the atmosphere at 25°C (Mill 1982);

loss rate $k = (3.4 \pm 1.7) \times 10^{-4} \text{ min}^{-1}$ in outdoor Teflon chambers in the dark (Grosjean 1985);

calculated lifetimes of 11 h and 18 d for reactions with OH radical, NO_3 radical, respectively (Atkinson 2000).

12.1.2 KETONES

12.1.2.1 Acetone

Common Name: Acetone

Synonym: 2-propanone, dimethylketone, DMK

Chemical Name: acetone, 2-propanone

CAS Registry No: 67-64-1

Molecular Formula: C_3H_6O , CH_3COCH_3

Molecular Weight: 58.079

Melting Point ($^{\circ}C$):

−94.7 (Lide 2003)

Boiling Point ($^{\circ}C$):

56.05 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.7899 (Weast 1982–83)

0.7908 (Dean 1985)

Molar Volume (cm^3/mol):

73.5 ($20^{\circ}C$, calculated-density)

74.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

5.690 (Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

miscible ($20^{\circ}C$, Palit 1947)

miscible (Dean 1985; Yaws et al. 1990)

miscible (Riddick et al. 1986; Howard 1990)

217700, 453000 (pseudo-solubilities, Staples 2000)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

29610* (interpolated-regression of tabulated data, temp range -59.4 to $56.5^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.19038 - 1233.4/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

30490 (Perry 1950)

51854* ($37.68^{\circ}C$, temp range 37.68 – $56.02^{\circ}C$, Brown & Smith 1957)

30800 (Buttery et al. 1969)

30810 (Hoy 1970)

29923* ($24.330^{\circ}C$, temp range -12.949 to $55.285^{\circ}C$, Boublik & Aim 1972; quoted, Boublik et al. 1984)

$\log(P/mmHg) = [-0.2185 \times 10577.7/(T/K)] + 9.143231$; temp range -20 to $96^{\circ}C$ (Antoine eq., Weast 1972–73)

30780, 30800 (calculated-Antoine eq., Boublik et al. 1973)

$\log(P/mmHg) = 7.15853 - 1231.232/(231.766 + t/^{\circ}C)$; temp range 37.6 – $56.02^{\circ}C$ (Antoine eq. from reported exptl. data of Brown & Smith 1957, Boublik et al. 1973)

$\log(P/mmHg) = 7.11714 - 1210.595/(229.664 + t/^{\circ}C)$; temp range -12.95 to $55.3^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1973)

30810* (ebulliometry, fitted to Antoine eq., measured range 259 – $350.9 K$, Ambrose et al. 1974)

$\log(P/kPa) = 6.25632 - 1217.904/(T/K - 42.692)$; temp range 311.7 – $350.9 K$, or for pressure range 53 – $202 kPa$ (Antoine eq., ebulliometry, Ambrose et al. 1975a)

$\log(P/kPa) = 6.25478 - 1216.689/(T/K - 42.875)$; temp range 259.17 – $350.9 K$, or for pressure below $225 kPa$ (Antoine eq., ebulliometry, Ambrose et al. 1974)

30870, 31520 (quoted exptl., calculated-Antoine eq., Boublik et al. 1984)

- $\log (P/\text{kPa}) = 6.24039 - 1209.746/(229.574 + t/^{\circ}\text{C})$; temp range -12.95 to 55.3°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.26017 - 1214.208/(230.002 + t/^{\circ}\text{C})$; temp range -13.98 to 77.72°C (Antoine eq. from reported exptl. data of Ambrose et al. 1974, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.28185 - 1230.342/(231.665 + t/^{\circ}\text{C})$; temp range 37.6 – 56.02°C (Antoine eq. from reported exptl. data of Brown & Smith 1957, Boublik et al. 1984)
 30780 (calculated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 7.11714 - 1210.595/(229.664 + t/^{\circ}\text{C})$, temp range: liquid (Antoine eq., Dean 1985, 1992)
 24227, 30806 (20, 25°C , Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.25478 - 1216.589/(230.275 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 30730 (interpolated-Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.24204 - 1210.6/(-43.49 + T/\text{K})$; temp range 261–329 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.75622 - 1566.69/(0.269 + T/\text{K})$; temp range 329–488 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 3.6452 - 469.5/(-108.21 + T/\text{K})$; temp range 178–243 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.19735 - 1190.382/(-45.373 + T/\text{K})$; temp range 203–269 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.26483 - 1221.852/(-42.388 + T/\text{K})$; temp range 257–334 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.24554 - 1211.515/(-43.471 + T/\text{K})$; temp range 323–379 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.69966 - 1542.465/(0.447 + T/\text{K})$; temp range 374–464 K (Antoine eq.-VII, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 28.5884 - 2.469 \times 10^3/(T/\text{K}) - 7.351 \cdot \log (T/\text{K}) + 2.8025 \times 10^{-10} \cdot (T/\text{K}) + 2.7361 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 178–508 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 3.34 (partial pressure, Butler & Ramchandani 1935)
 3.96 (shake flask, partial vapor pressure-GC, Burnett 1963)
 3.25 (28°C , concn. ratio-GC, Nelson & Hoff 1968)
 3.97 (shake flask, partial vapor pressure-GC, Buttery et al. 1969)
 4.02, 3.93, 2.91 (exptl., calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 4.05 (headspace-GC, Vitenberg et al. 1975)
 4.10 (calculated-activity coeff and vapor pressure, γ -P, Rathbun & Tai 1982)
 0.908, 3.93 (0, 25°C , headspace-GC, Snider & Dawson 1985)
 3.38 (review, Gaffney et al. 1987)
 2.928* (gas-stripping-HPLC-UV, measured range 10 – 45°C , Zhou & Mopper 1990)
 $\ln [K_H'/(M/\text{atm})] = -5.00 + 1977/(T/\text{K})$; temp range 10 – 45°C (gas stripping-HPLC measurements, freshwater, Zhou & Mopper 1990)
 $\ln [K_H'/(M/\text{atm})] = -3.60 + 1518/(T/\text{K})$; temp range 25 – 45°C (gas stripping-HPLC measurements, seawater (salinity 35 ± 11), Zhou & Mopper 1990)
 3.07* (gas stripping-GC, measured range -14.9 to 44.9°C , Betterton 1991)

 0.722, 1.26, 2.045, 5.31, 7.514 (0.51, 9.0, 16.11, 31, 38.51°C , headspace-GC, de-ionized water, Benkelberg et al. 1995)
 3.735* (headspace-GC, rain water, measured range -30 to 39.51°C , Benkelberg et al. 1995)
 0.762, 2.19, 6.64, 10.30 (0, 14.51, 30, 39.51°C , headspace-GC, artificial seawater, Benkelberg et al. 1995)
 $\ln (k_H/\text{atm}) = (18.4 \pm 0.3) - (5386 \pm 100)/(T/\text{K})$, temp range 10 – 40°C (headspace-GC measurements, Benkelberg et al. 1995)
 2.56 (20°C , selected from literature experimentally measured data, Staudinger & Roberts 1996)
 9.92 (EPICS-GC, Ayuttaya et al. 2001)
 2.58 (20°C , selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 3.742 - 1965/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, log K_{OW} :

-0.24	(shake flask-CR, Collander 1951)
-0.24	(shake flask at pH 7, Unger et al. 1978)
-0.48	(shake flask-GC, Tani et al. 1986)
-0.24	(recommended, Sangster 1989, 1993)
-0.31	(CPC centrifugal partition chromatography, Gluck & Martin 1990)
-0.37	(calculated-UNIFAC activity coeff., Dallos et al. 1993)
-0.24	(recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} :

2.31	(head-space GC, Abraham et al. 2001)
------	--------------------------------------

Bioconcentration Factor, log BCF:

-0.187	(calculated, Staples 2000)
--------	----------------------------

Sorption Partition Coefficient, log K_{OC} :

-0.586	(calculated- K_{OW} , Kollig 1993)
-0.523	(quoted calculated value, Staples 2000)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} = 20$ h was estimated for a model river 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1990).

Photolysis: rate constant $k = 1.4 \times 10^{-5} \text{ s}^{-1}$ in the atmosphere (Carlier et al. 1986); calculated lifetime $\tau \sim 60$ d in air (Atkinson 2000)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or Arrhenius expression see reference:

photooxidation $t_{1/2} = 11.3\text{--}453$ yr, based on measured data for the reaction with hydroxyl radical in aqueous solution (Dorfman & Adams 1973; selected, Howard et al. 1991)

photooxidation $t_{1/2} > 9.9$ d for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976)

$k_{OH} = (0.23 \pm 0.03) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 K (flash photolysis-resonance fluorescence, Zetzsch 1982; quoted, Atkinson 1985)

$k_{OH} = (0.62 \pm 0.09) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (relative rate technique to *n*-hexane, Chiorboli et al. 1983; quoted, Atkinson 1985)

$k = 0.032 \pm 0.006 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water using 1 mM propyl alcohol as scavenger at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{OH}(\text{calc}) = 2.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 2.3 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

photooxidation $t_{1/2} = 279\text{--}2790$ h, based on measured data for the vapor-phase reaction with hydroxyl radical in air (Atkinson 1985; selected, Howard et al. 1991)

$k_{OH} = 2.16 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K and $k = 1.80 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the aqueous-phase reaction with hydroxyl radical in solution (Wallington & Kurylo 1987)

$k_{OH} = 2.16 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 1.8 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988)

$k_{OH}^* = 2.26 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH}(\text{calc}) = 0.18 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation: biodegradation rate constants, $k = 0.016\text{--}0.020 \text{ h}^{-1}$ in 30 mg/L activated sludge after a time lag of 20–25 h (Urano & Kato 1986b);

$t_{1/2}(\text{aq. aerobic}) = 24\text{--}168$ h, based on unacclimated aqueous screening test data (Bridie et al. 1979; Dore et al. 1975; selected, Howard et al. 1991);

$t_{1/2}(\text{aq. anaerobic}) = 96\text{--}672$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

$k(\text{exptl}) = 0.0440 \text{ h}^{-1}$ compared to predicted rate constants by group contribution method: $k = 0.0433 \text{ h}^{-1}$ (nonlinear) and $k = 0.043 \text{ h}^{-1}$ (linear) (Tabak & Govind 1993).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} > 9.9 \text{ d}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photooxidation $t_{1/2} = 279\text{--}2790 \text{ h}$, based on measured data for the vapor-phase reaction with hydroxyl radical in air (Howard et al. 1991);

calculated lifetimes $\tau = 53 \text{ d}$ and $\tau > 11 \text{ yr}$ for reactions with OH radical, NO_3 radical, respectively (Atkinson 2000);

photooxidation and photolysis $t_{1/2} = 36 \text{ h}$ (Staples 2000).

Surface water: photooxidation $t_{1/2} = 11.3\text{--}453 \text{ yr}$, based on measured data for the reaction with hydroxyl radicals in aqueous solution (Dorfman & Adams 1973; quoted, Howard et al. 1991);

$t_{1/2} = 24\text{--}168 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

aerobic biodegradation $t_{1/2} = 96\text{--}168 \text{ h}$ (Staples 2000).

Ground water: $t_{1/2} = 48\text{--}336 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment: anaerobic biodegradation $t_{1/2} = 384 \text{ h}$ or 16 d (Staples 2000).

Soil: $t_{1/2} = 24\text{--}168 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

aerobic biodegradation $t_{1/2} = 96\text{--}168 \text{ h}$ (Staples 2000).

FIGURE 12.1.2.1.2 Logarithm of Henry's law constant versus reciprocal temperature for acetone.

12.1.2.2 2-Butanone (Methyl ethyl ketone)

Common Name: Methyl ethyl ketone

Synonym: 2-butanone, butan-2-one, MEK

Chemical Name: 2-butanone, methyl ethyl ketone

CAS Registry No: 78-93-3

Molecular Formula: C_4H_8O , $CH_3CH_2COCH_3$

Molecular Weight: 72.106

Melting Point ($^{\circ}C$):

−86.64 (Lide 2003)

Boiling Point ($^{\circ}C$):

79.59 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8054 (Weast 1982–83)

0.7997 ($25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

89.9 (calculated-density, Rohrschneider 1973)

96.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

14.7 (pK_a , Riddick et al. 1986)

−7.2 (pK_{BH}^+ , Riddick et al. 1986)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

8.439 (Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

240000 ($20^{\circ}C$, synthetic method, Jones 1929; quoted, Palit 1947; Dean 1985; Riddick et al. 1986)

255700* (shake flask-volumetric method, measured range 20 – $30^{\circ}C$ Ginnings et al. 1940)

343550 (shake flask-volumetric, Ginnings et al. 1940)

228020 (estimated, McGowan 1954)

12420 ($20^{\circ}C$, Amidon et al. 1975)

136280 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)

353000 ($20^{\circ}C$, Verschuereen 1983)

249000 (selected, Yaws et al. 1990)

276000*, 235000 ($19.3^{\circ}C$, $29.7^{\circ}C$, shake flask-GC, measured range 0 – $70.2^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

12954* (interpolated-regression of tabulated data, temp range -48.3 to $79.6^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.22200 - 1343.6/(230 + t/^{\circ}C)$, (Antoine eq., Dreisbach & Martin 1949)

16500* ($31.84^{\circ}C$, ebulliometry, measured range 31.84 – $79.5^{\circ}C$, Dreisbach & Shrader 1949)

25158* ($41.46^{\circ}C$, flow calorimetry, measured range 41.46 – $79.5^{\circ}C$, Nickerson et al. 1961)

26568* ($42.778^{\circ}C$, ebulliometry, measured range 42.778 – $88.444^{\circ}C$, Collerson et al. 1965)

$\log(P/mmHg) = 7.06376 - 1261.455/(221.982 + t/^{\circ}C)$; temp range 42.778 – $88.444^{\circ}C$ (Antoine eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/mmHg) = 19.48322 - 2328.0/(T/K) - 3.92657 \cdot \log(T/K)$; temp range 42.778 – $88.444^{\circ}C$ (Kirchhoff eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/mmHg) = [-0.2185 \times 8149.5/(T/K)] + 7.959295$; temp range -48.3 to $79.6^{\circ}C$ (Antoine eq., Weast 1972–73)

- 12079* (ebulliometry, Ambrose et al. 1975a; quoted, Riddick et al. 1986; Howard 1990)
 12000, 12060, 12640 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.02273 - 1167.861/(211.199 + t/^{\circ}\text{C})$; temp range 41.46–97.42°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.18397 - 1258.948/(221.725 + t/^{\circ}\text{C})$; temp range 42.78–86.44°C (Antoine eq. from reported exptl. data of Ambrose et al. 1975, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.18838 - 1261.297/(222.964 + t/^{\circ}\text{C})$; temp range 42.79–88.4°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 12020 (extrapolated-Antoine eq., Dean 1985)
 $\log(P/\text{mmHg}) = 7.06356 - 1261.34/(221.97 + t/^{\circ}\text{C})$; temp range 43–88°C (Antoine eq., Dean 1985, 1992)
 12700 (Howard et al. 1986; quoted, Banerjee et al. 1990)
 12120 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.24715 - 1294.53/(-47.442 + T/\text{K})$; temp range 294–352 K (Antoine eq.-I., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.18479 - 1259.519/(-51.359 + T/\text{K})$; temp range 315–363 K (Antoine eq.-II., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.22518 - 1286.794/(-47.766 + T/\text{K})$; temp range 353–403 K (Antoine eq.-III., Stephenson & Malanowski 1987)
 5425 (calculated-solvatochromic parameters, Banerjee et al. 1990)
 $\log(P/\text{mmHg}) = 47.706 - 3.0965 \times 10^3/(T/\text{K}) - 15.184 \cdot \log(T/\text{K}) + 7.4846 \times 10^{-3} \cdot (T/\text{K}) - 1.7084 \times 10^{-13} \cdot (T/\text{K})^2$; temp range 186–536 K (vapor pressure eq., Yaws 1994)
 12071* (static method-manometry, measured range 0–50°C, Garriga et al. 1996)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

 4.723 (quoted, exptl., Hine & Mookerjee 1975)
 5.549, 4.408 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 3.87 (headspace-GC, Vitenberg et al. 1975)
 6.191, 4.215 (calculated- γ -P, calculated-MW, Rathbun & Tai 1982)
 0.987, 5.76 (0, 25°C, gas stripping-GC, Snider & Dawson 1985)
 13.17* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln[H/(\text{atm} \cdot \text{m}^3/\text{mol})] = -26.32 - 5214/(T/\text{K})$, temp range 10–30°C, (EPICS measurements, Ashworth et al. 1988)
 5.210 (gas stripping-HPLC/UV, Zhou & Mopper 1990)
 5.117* (gas-stripping-HPLC-UV, measured range 10–45°C, Zhou & Mopper 1990)
 $\ln[K_H'/(M/\text{atm})] = -6.03 + 2184/(T/\text{K})$, temp range 10–45°C (gas stripping-HPLC measurements, freshwater, Zhou & Mopper 1990)
 $\ln[K_H'/(M/\text{atm})] = -5.97 + 2138/(T/\text{K})$, temp range 10–45°C (gas stripping-HPLC measurements, seawater (salinity 35 ± 1 l), Zhou & Mopper 1990)
 18.28* (45°C, equilibrium headspace-GC, measured range 45–80°C, Ettre et al. 1993)
 $\log(1/K_{AW}) = -3.7973482 + 1889.5294/(T/\text{K})$, temp range 45–80°C (equilibrium headspace-GC measurements, Ettre et al. 1993)
 3.85 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 3.95 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 4.764 - 2213/(T/\text{K})$, (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)
 5.04 – 3.54 (27°C, equilibrium headspace-GC, solute concn 10.01–85.10 mg/L, measured range 300–315 K, Cheng et al. 2003)
 5.04* (27°C, equilibrium headspace-GC, measured range 27–42°C, Cheng et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 0.26 (shake flask-CR, Collander 1957)
 0.28 (shake flask-UV, Fujita et al. 1964, Hansch & Leo 1979)
 0.32 ± 0.01 (shake flask-UV, calculated, Iwasa et al. 1965)
 0.29 (shake flask-UV, GC, Hansch & Anderson 1967; Hansch et al. 1968; Leo et al. 1969, 1971)
 0.28 ± 0.02 (shake flask at pH 7, Unger et al. 1978)

0.69	(generator column-GC, Wasik et al. 1981; Tewari et al. 1982)
0.26	(shake flask-GC, Tanii et al. 1986)
0.62	(calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
0.29	(recommended, Sangster 1989, 1993)
0.29	(recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

2.77	(head-space GC, Abraham et al. 2001)
------	--------------------------------------

Bioconcentration Factor, $\log BCF$:

0.00	(estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)
------	--

Sorption Partition Coefficient, $\log K_{OC}$:

1.53	(soil, estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)
1.47 ± 0.55 , 1.53 ± 0.88 ; 1.50	(Captina silt loam, McLaurin sandy loam; weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)
0.070	(predicted- K_{OW} , Walton et al. 1992)
-0.03	(calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: based on lab. data for evaporation relative to the reaeration rate of 0.27 (Mackay et al. 1982; Rathbun & Tai 1982; quoted, Howard 1990) and typical reaeration rates of rivers and lakes (Mill et al. 1982; quoted, Howard 1990),

$t_{1/2} = 3$ d for evaporation from a river and $t_{1/2} = 12$ d from lake (Howard 1990).

Photolysis: rate constant $k = 1.4 \times 10^{-5} \text{ s}^{-1}$ in the atmosphere (Carrier et al. 1986); calculated lifetime $\tau \sim 4$ d in air (Atkinson 2000)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

photooxidation $t_{1/2} = 48.8 - 81.4$ yr, based on measured rate data for the reaction with hydroxyl radical in aqueous solution (Anbar & Neta 1967; selected, Howard et al. 1991)

photooxidation $t_{1/2} = 2.4 - 24$ h in air for the gas-phase reaction with hydroxyl radical, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radicals (Darnall et al. 1976)

$k_{OH} = (0.20 \pm 0.06) \times 10^{10} \text{ cm}^3 \text{ M}^{-1} \text{ s}^{-1}$ at 1 atm and 305 ± 2 K (relative rate method, Winer et al. 1976)

$k < 2.0 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation with singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 00$ yr (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{OH} = 1.9 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C with $t_{1/2} = 2.9$ d (Hendry & Kenley 1979; quoted, Mill 1982)

$k_{OH} = (0.95 \pm 0.09) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at (295 ± 2) K in air (relative rate technique to ethene Cox et al. 1981; quoted, Atkinson 1985)

$k_{OH} = (1.20 \pm 0.20) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 K in air (flash photolysis-resonance fluorescence, Zetzsch 1982; quoted, Atkinson 1985)

$k = (0.12 \pm 0.02) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water using 20–300 mM *t*-BuOH as scavenger at pH 2 and $20\text{--}23^\circ\text{C}$ (Hoigné & Bader 1983)

$k_{OH}(\text{calc}) = 1.38 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 1.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH} = 0.97 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 24°C with an atmospheric lifetime $\tau = 12$ d (Edney et al. 1986)

$k_{OH} = 1.15 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K and $k(\text{soln}) = 1.50 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the aqueous-phase reaction with OH radical in solution (Wallington & Kurylo 1987; quoted, Wallington et al. 1988)

$k_{OH}^* = 1.15 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

photooxidation $t_{1/2} = 64.2 - 642$ h, based on measured rate data for the vapor phase reaction with hydroxyl radical (Howard et al. 1991)

$k_{OH}(\text{calc}) = 1.65 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: first-order hydrolysis $t_{1/2} > 0$ yr, based on nonreactive hydrolysis from pH 5 to 9 at 15°C (Kollig et al. 1987; selected, Howard et al. 1991).

Biodegradation:

$k = 0.021 - 0.025 \text{ h}^{-1}$ in 30 mg/L activated sludge after a time lag of 5 h (Urano & Kato 1986b)

$t_{1/2}(\text{aq. aerobic}) = 24 - 168 \text{ h}$, based on unacclimated grab sample of aerobic freshwater (Dojlido 1979; selected, Howard et al. 1991) and aerobic aqueous screening test data (Takemoto et al. 1981; selected, Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 96 - 672 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 1 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 28 \text{ d}$ in natural waters (Capel & Larson 1995)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 2.4 - 24 \text{ h}$ in air for the gas-phase reaction with hydroxyl radical, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photodecomposition $t_{1/2} = 9.8 \text{ h}$ under simulated atmospheric conditions, with NO (Dilling et al. 1976)

$t_{1/2} = 2.3 \text{ d}$ for the atmospheric reaction with photochemically produced hydroxyl radical (Cox et al. 1981; quoted, Howard 1990);

photooxidation $t_{1/2} = 64.2 - 642 \text{ h}$, based on measured rate data for the vapor phase reaction with hydroxyl radical (Atkinson 1985; selected, Howard et al. 1991);

calculated atmospheric lifetime $\tau = 12 \text{ d}$ due to reaction with OH radical (Edney et al. 1986) atmospheric transformation lifetime $\tau < 1 \text{ d}$ (estimated, Kelly et al. 1994);

calculated lifetime $\tau = 10 \text{ d}$ for reaction with OH radical (Atkinson 2000).

Surface water: photooxidation $t_{1/2} = 48.8 - 81.4 \text{ yr}$, based on measured rate data for the reaction with hydroxyl radical in aqueous solution (Anbar & Neta 1967; quoted, Howard et al. 1991); $t_{1/2} = 24 - 168 \text{ h}$, based on unacclimated grab sample of aerobic freshwater (Dojlido 1979; selected, Howard et al. 1991) and aerobic aqueous screening test data (Takemoto et al. 1981; selected, Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 1 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 28 \text{ d}$ in natural waters (Capel & Larson 1995).

Ground water: $t_{1/2} = 48 - 336 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: calculated $t_{1/2} = 4.9 \text{ d}$ from first-order kinetic of degradation under both sterile and nonsterile conditions (Anderson et al. 1991);

$t_{1/2} = 24 - 168 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

12.1.2.3 2-Pentanone

Common Name: 2-Pentanone

Synonym: 2-pentanone, methyl propyl ketone, methyl *n*-propyl ketone, ethylacetone

Chemical Name: 2-pentanone, methyl propyl ketone

CAS Registry No: 107-87-9

Molecular Formula: C₅H₁₀O, CH₃CH₂CH₂COCH₃

Molecular Weight: 86.132

Melting Point (°C):

−77.80 (Stull 1947; Weast 1982–83; Dean 1985; Howard 1990)

−76.8 (Lide 2003)

Boiling Point (°C):

102.0 (Weast 1982–83; Verschuereen 1983)

101.7 (Dean 1985; Howard 1990)

102.26 (Lide 2003)

Density (g/cm³ at 20°C):

0.8089 (Weast 1982–83)

0.8064, 0.8015 (20°C, 25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

118.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

2.541 (Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} J/mol K:

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

54268* (30°C, shake flask-interferometer, measured range 10–50°C, Gross et al. 1939)

30150 (30°C, Gross et al. 1939)

55100 (shake flask-volumetric, Ginnings et al. 1940)

59500 (20°C, shake flask-volumetric, Ginnings et al. 1940)

64010 (shake flask-interferometer, Donahue & Bartell 1952)

54350 (McGowan 1954; Deno & Berkheimer 1960)

43000 (Verschuereen 1977, 1983)

59500 (20°C, Riddick et al. 1986)

55400 (selected, Yaws et al. 1990)

59000* (19.7°C, shake flask-GC, measured range 0–90.5°C, Stephenson 1992)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2088* (interpolated-regression of tabulated data, temp range −12.7 to 102.7°C, Stull 1947)

2666 (28.5°C, Stull 1947)

20440* (56.649°C, ebulliometry, measured range 56.5–111.655°C, Collerson et al. 1965)

log (P/mmHg) = 7.01753 − 1311.145/(214.693 + t/°C); temp range 56.5–111.65°C (Antoine eq., ebulliometric measurements, Collerson et al. 1965)

log (P/mmHg) = 21.71880 − 2694.12/(T/K) − 4.63307·log (T/K); temp range 56.5–111.65°C (Kirchhoff eq., ebulliometric measurements, Collerson et al. 1965)

log (P/mmHg) = 6.13916 − 1379.06/(221.41 + t/°C); temp range −5 to 100°C (data fitted to Antoine eq., static method-Ramsey-Young apparatus measurements, Meyer & Wagner 1966)

log (P/mmHg) = [−0.2185 × 11240.6/(T/K)] + 9.432089; temp range −12–103.3°C (Antoine eq., Weast 1972–73)

4720* (ebulliometry-fitted to Antoine eq., Ambrose et al. 1975a)

2133 (quoted, Verschuereen 1983)

- 1621 (quoted, Mackay & Yuen 1983)
 4648 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.14908 - 1311.372/(214.222 + t/^\circ\text{C})$, temp range 61.72–121.4°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{mmHg}) = 7.02193 - 1313.85/(215.01 + t/^\circ\text{C})$, temp range 56–111°C (Antoine eq., Dean 1985, 1992)
 4702 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.14243 - 1311.145/(-58.457 + T/\text{K})$, temp range 329–386 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.1404 - 1310.269/(-58.514 + T/\text{K})$, temp range 336–422 K, (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.47975 - 1569.596/(-24.035 + T/\text{K})$, temp range 416–501 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log(P/\text{mmHg}) = 18.3056 - 2.3477 \times 10^3/(T/\text{K}) - 3.6667 \cdot \log(T/\text{K}) + 7.1502 \times 10^{-4} \cdot (T/\text{K}) + 1.0912 \times 10^{-13} \cdot (T/\text{K})^2$; temp range 196–561 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

- 10.91 (28°C, concn. ratio-GC, Nelson & Hoff 1968)
 6.44 (partial vapor pressure-GC, Buttery et al. 1969)
 6.52 (quoted, exptl., Hine & Mookerjee 1975)
 7.66, 6.52 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 3.83 (calculated- γ -P, Rathbun & Tai 1982)
 5.876 (gas-stripping, Hawthorne 1984)
 10.13 (modified gas-stripping, Hawthorne et al. 1985)
 8.47, 6.83 (gas stripping-GC, calculated-P/C, Shiu & Mackay 1997)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 0.91 \pm 0.03 (shake flask-UV at pH 7, Unger et al. 1978)
 0.91 (Hansch & Leo 1985)
 0.78 (shake flask-GC, Tanii et al. 1986)
 0.87 (calculated- V_1 and solvatochromic parameters, Kamlet et al. 1988)
 0.95 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 0.84 (recommended, Sangster 1989; 1993)
 0.91 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

- 3.19 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

- 0.477 (estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 1.869 (soil, estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} = 15.5$ h was estimated for a model river of 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s, and $t_{1/2} = 14.5$ h in a wind-wave tank with a 6m/s wind speed (Howard 1990).
 Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 photooxidation $t_{1/2} = 2.4\text{--}24$ h for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976)

$k_{\text{OH}} = (4.64 \pm 0.14) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $(299 \pm 2) \text{ K}$ (relative rate technique to cyclohexane Atkinson et al. 1982; quoted, Atkinson 1985)

$k \sim 0.02 \text{ M}^{-1} \cdot \text{s}^{-1}$ for the reaction with ozone in water at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{\text{OH}}(\text{calc}) = 4.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 4.64 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{\text{OH}} = 4.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K and $k(\text{soln}) = 3.20 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the aqueous-phase reaction with OH radical in solution (Wallington & Kurylo 1987; quoted, Wallington et al. 1988)

$k_{\text{OH}} = 4.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 5.79 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

$k_{\text{OH}} = (4.56 \pm 0.30) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ with calculated tropospheric lifetime $\tau = 2.5 \text{ d}$ (relative rate method, Atkinson et al. 2000)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 2.4\text{--}24 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

$t_{1/2} = 3.5 \text{ d}$ for reactions with photochemically produced OH radical (Howard 1990);

calculated lifetime $\tau = 2.5 \text{ d}$ for reaction with OH radical (Atkinson 2000).

Surface water: volatilization $t_{1/2} = 11\text{--}17 \text{ h}$ from a model river (Howard 1990).

12.1.2.4 3-Pentanone

Common Name: 3-Pentanone

Synonym: diethyl ketone, ethylketone, propione, *sym*-dimethylacetone

Chemical Name: 3-pentanone, diethyl ketone

CAS Registry No: 96-22-0

Molecular Formula: $C_5H_{10}O$, $CH_3CH_2COCH_2CH_3$

Molecular Weight: 86.132

Melting Point ($^{\circ}C$):

−39 (Lide 2003)

Boiling Point ($^{\circ}C$):

101.7 (Gross et al. 1933; Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8138 (Weast 1982–83)

0.8143, 0.8095 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

92.6 (calculated-density, Jaworska & Schultz 1993)

118.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

27.1 (pK_a , Riddick et al. 1986; Howard 1993)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

11.593 (Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

46900 ($30^{\circ}C$, shake flask-interferometer, Gross et al. 1933)

49617* ($30^{\circ}C$, shake flask-interferometer, measured range 10 – $50^{\circ}C$, Gross et al. 1939)

49620 ($30^{\circ}C$, shake flask-interferometer, Gross et al. 1933)

48100* (shake flask-volumetric method, measured range 20 – $30^{\circ}C$, Ginnings et al. 1940)

48100 (shake flask-volumetric, Ginnings et al. 1940)

44520 (shake flask-centrifuge, Booth & Everson 1948)

43170 (estimated, McGowan 1954)

47330 (Deno & Berkheimer 1960)

45650 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)

47000, 38000 ($20^{\circ}C$, $100^{\circ}C$, Verschueren 1983)

34000 ($20^{\circ}C$, Riddick et al. 1986)

48440 (calculated-fragment solubility const., Wakita et al. 1986)

53000* ($19.3^{\circ}C$, shake flask-GC, measured range 0 – $80^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2169* (interpolated-regression of tabulated data, temp range -12.0 to $103.3^{\circ}C$, Stull 1947)

2666 ($27.9^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.25223 - 1450.0/(230 + t/^{\circ}C)$, (Antoine eq., Dreisbach & Martin 1949)

10114* ($36.36^{\circ}C$, ebulliometry, measured range 36.36 – $101.7^{\circ}C$, Dreisbach & Shrader 1949)

20441* ($56.649^{\circ}C$, ebulliometry, measured range 56.5 – $111.3^{\circ}C$, Collerson et al. 1965)

$\log(P/mmHg) = 7.027427 - 1309.655/(214.118 + t/^{\circ}C)$; temp range 56.5 – $111.3^{\circ}C$ (Antoine eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/mmHg) = 22.02258 - 2614.85/(T/K) - 4.72805 \cdot \log(T/K)$; temp range 56.5 – $111.3^{\circ}C$ (Kirchhoff eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/\text{mmHg}) = [-0.2185 \times 11183.0/(T/K)] + 9.406280$; temp range -12.7 – 102.7°C , (Antoine eq., Weast 1972–73)
 4723* (ebulliometry-fitted to Antoine eq., Ambrose et al. 1975a)
 1733 (20°C , Verschueren 1983)
 5316, 4714 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.1467 - 1307.941/(213.968 + t/^\circ\text{C})$, temp range 56.53 – 111.3°C (Antoine eq. from reported exptl. data of Ambrose et al. 1975, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.13703 - 1349.358/(224.351 + t/^\circ\text{C})$, temp range 36.36 – 101.7°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 4693 (extrapolated-Antoine eq., Dean 1985)
 $\log(P/\text{mmHg}) = 7.02529 - 1310.28/(214.19 + t/^\circ\text{C})$, temp range 56 – 111°C (Antoine eq., Dean 1985, 1992)
 4723 (Riddick et al. 1986)
 $\log(P_L/\text{kPa}) = 6.14917 - 1309.657/(-59.032 + T/K)$, temp range 329 – 384 K, (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.14635 - 1308.327/(-59.137 + T/K)$, temp range 329 – 426 K, (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.45505 - 1544.596/(-27.379 + T/K)$, temp range 421 – 502 K, (Antoine eq.-III, Stephenson & Malanowski 1987)
 4932 (Daubert & Danner 1989)
 $\log(P/\text{mmHg}) = 32.265 - 2.9431 \times 10^3/(T/K) - 8.5068 \cdot \log(T/K) - 4.572 \times 10^{-10} \cdot (T/K) + 2.5177 \times 10^{-6} \cdot (T/K)^2$;
 temp range 234 – 561 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$):

3.617 (calculated- γ -P, Rathbun & Tai 1982)
 5.340 (calculated-MW, Rathbun & Tai 1982)
 8.834 (calculated-P/C, Howard 1993)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.99 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)
 0.75 (calculated-activity coeff. γ , Wasik et al. 1981)
 0.67 (calculated- activity coeff. γ , Berti et al. 1986)
 1.15 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 0.82 (recommended, Sangster 1989, 1993)
 0.99 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.20 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

0.519 (estimated- K_{OW} , Lyman et al. 1990; quoted, Howard 1993)
 0.146 (estimated-S, Lyman et al. 1990; quoted, Howard 1993)

Sorption Partition Coefficient, $\log K_{OC}$:

1.914 (soil, estimated- K_{OW} , Lyman et al. 1990; quoted, Howard 1993)
 1.08 (soil, estimated-S, Lyman et al. 1990; quoted, Howard 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated half-life from a model pond of two meter deep is 5.6 d (USEPA 1987; quoted, Howard 1993);
 based on calculated Henry's law constant, estimated $t_{1/2} \sim 12$ h from a model river of 1 m deep flowing at
 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1990; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3}
 with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 photooxidation $t_{1/2} = 2.4$ – 24 h for the gas-phase reaction with OH radical in air, based on the rate of
 disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{\text{OH}} = (1.82 \pm 0.33) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $299 \pm 2 \text{ K}$ in air (relative rate technique to cyclohexane Atkinson et al. 1982)

$k_{\text{OH}}(\text{calc}) = 2.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.82 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{\text{OH}}(\text{exptl}) = 2.74 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 296 K; experimentally determined $k(\text{soln}) = 2.30 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with OH radical in aqueous solution (Wallington & Kurylo 1987; quoted, Wallington et al. 1988)

$k_{\text{OH}} = 2.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 3.23 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: not expected to be important (Howard 1993).

Biodegradation: $t_{1/2} \sim 5$ to 10 d in acclimated cultures during screening tests (Howard 1993).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 2.4\text{--}24 \text{ h}$ for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976);

photooxidation $t_{1/2} = 5.9 \text{ d}$, based on an experimentally determined rate constant for the vapor-phase reaction with OH radical in air (Wallington & Kurylo 1987; quoted, Howard 1993).

Surface water: estimated volatilization $t_{1/2} \sim 12 \text{ h}$ in a model river (1 m deep flowing at 1 m/s with a 3 m/s wind) and $t_{1/2} = 5.6 \text{ d}$ in a model environmental pond (2 m deep) (Howard 1993).

12.1.2.5 Methyl isobutyl ketone (MIBK)

Common Name: Methyl isobutyl ketone

Synonym: hexone, hexanone, 4-methyl-2-pentanone, MIBK

Chemical Name: methyl isobutyl ketone, 4-methyl-2-pentanone

CAS Registry No: 108-10-1

Molecular Formula: $C_6H_{12}O$, $(CH_3)_2CHCH_2COCH_3$

Molecular Weight: 100.158

Melting Point ($^{\circ}C$):

-84 (Lide 2003)

Boiling Point ($^{\circ}C$):

116.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.7978 (Weast 1982-83)

0.8010 (Riddick et al. 1986)

Molar Volume (cm^3/mol):

125.0 ($20^{\circ}C$, calculated-density)

140.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

Entropy of Fusion ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

16630* ($30^{\circ}C$, shake flask-interferometer, measured range $0-75^{\circ}C$, Gross et al. 1939)

19100* (shake flask-volumetric method, measured range $20-30^{\circ}C$, Ginnings et al. 1940)

19100 (shake flask-volumetric, Ginnings et al. 1940)

18200 (shake flask-turbidimeter, McBain & Richards 1946)

19085 (Deno & Berkheimer 1960)

17700 (shake flask-radiometric method, Lo et al. 1986)

17000 (Dean 1985; Riddick et al. 1986)

19200* ($19.4^{\circ}C$, shake flask-GC/TC, measured range $0-90.4^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

666.6* ($19.7^{\circ}C$, summary of literature data, temp range -1.40 to $119^{\circ}C$, Stull 1947)

2200* ($21.7^{\circ}C$, isoteniscope method, measured range $21.7-116.2^{\circ}C$, Fuge et al. 1952)

$\log (P/mmHg) = 31.1616 - 7.7701 \cdot \log (273.1 + t/^{\circ}C) - 3173.11/(273.11 + t/^{\circ}C)$; temp range $21.7-116.2^{\circ}C$ (isoteniscope method, Fuge et al. 1952)

$\log (P/mmHg) = [-0.2185 \times 11669.6/(T/K)] + 9.407655$; temp range: -1.4 to $119^{\circ}C$, (Antoine eq., Weast 1972-73)

800; 1333 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1983)

2200 ($21.7^{\circ}C$, quoted exptl., Boublik et al. 1984; Howard 1990)

2587 (calculated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 5.81291 - 1176.833/(192.925 + t/^{\circ}C)$, temp range $21.7-116.2^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

2575 (calculated-Antoine eq., Dean 1985)

$\log (P/mmHg) = 6.6727 - 1168.4/(191.9 + t/^{\circ}C)$, temp range $22-116^{\circ}C$ (Antoine eq., Dean 1985, 1992)

2510 (Riddick et al. 1986)

$\log (P/kPa) = 6.0976 - 1190.69/(195.45 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

2581, 2581 (interpolated-Antoine eq.-I and II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.79768 - 1168.443/(-81.202 + T/\text{K})$, temp range 294–390 K, (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.83311 - 1188.115/(-79.265 + T/\text{K})$, temp range 281–400 K, (Antoine eq.-II, Stephenson & Malanowski 1987)

2687* (comparative ebulliometry, extrapolated-Antoine eq., measured range 309.7–416 K, Ambrose et al. 1988)

$\ln (p/\text{kPa}) = 14.07841 - 3103.029/(T/\text{K} - 61.104)$; temp range 309.7–416 K (comparative ebulliometry, Ambrose et al. 1988)

$\log (P/\text{mmHg}) = 64.1919 - 4.3577 \times 10^3/(T/\text{K}) - 19.766 \cdot \log (T/\text{K}) - 3.9997 \times 10^{-10} \cdot (T/\text{K}) + 7.102 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 189–571 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

39.5* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)

$\ln [H/(\text{atm m}^3/\text{mol})] = -7.157 + 160.6/(T/\text{K})$, temp range 10–30°C, (EPICS measurements, Ashworth et al. 1988)

9.523 (calculated-P/C, Howard 1990)

47.95* (40°C, equilibrium headspace-GC, measured range 40–80°C, Kolb et al. 1992)

$\ln (1/K_{AW}) = -9.56 + 4237/(T/\text{K})$, temp range: 40–80°C (equilibrium headspace-GC measurements, Kolb et al. 1992)

45.57 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)

$\log K_{AW} = -1.924 + 57/(T/\text{K})$, (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.38 (shake flask-GC, Iwasa et al. 1965)

1.09 (calculated- π constant, Hansch et al. 1968)

1.19 (Hansch & Leo, 1979)

1.39 (HPLC-RT correlation, Haky & Young 1984)

1.31 (shake flask-GC, Tanii et al. 1986)

1.38 (recommended, Sangster 1993)

1.31 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

0.301–0.699 (estimated- K_{OW} and S, Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

1.279–2.025 (soil, estimated- K_{OW} and S, Lyman et al. 1982; quoted, Howard 1990)

0.87 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 15\text{--}33$ h from water of 1 m deep, based on lab. mass-transfer coefficient for volatilization from a stirred 557–2020 rpm water bath at 25°C (Rathbun & Tai 1982; quoted, Howard 1990).

Photolysis: direct photolysis $t_{1/2} = 15$ h in air (Howard 1990).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 0.24\text{--}2.4$ h for the gas-phase reaction with OH radical in air, based on the disappearance rate of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{OH} = (0.9 \pm 0.3) \times 10^{10} \text{ cm}^3 \text{ M}^{-1} \text{ s}^{-1}$ at 1 atm and 305 ± 2 K (relative rate method, Winer et al. 1976)

$k_{OH}(\text{calc}) = 9.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 14.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

photooxidation $t_{1/2} = 4.6\text{--}45.5$ h, based on measured rate data for the vapor phase reaction with hydroxyl radical (Atkinson 1985; selected, Howard et al. 1991)

$k_{OH} = 14.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}} = (1.31 - 1.45) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (OH radical concn. of $8.0 \times 10^5 \text{ molecule}\cdot\text{cm}^{-3}$) at 22–27°C, estimated $t_{1/2} = 16\text{--}17 \text{ h}$ (Howard 1990)

$k_{\text{OH}}(\text{calc}) = 3.92 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: not expected to undergo chemical hydrolysis (Howard 1990).

Biodegradation: aqueous aerobic $t_{1/2} = 24\text{--}168 \text{ h}$, based on unacclimated aerobic aqueous screening test data (Bridie et al. 1979; Takemoto et al. 1981; selected, Howard et al. 1991);

aqueous anaerobic $t_{1/2} = 96\text{--}672 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the disappearance rate of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photodecomposition $t_{1/2} = 3.5 \text{ h}$ under simulated atmospheric conditions, with NO (Dilling et al. 1976);

direct photolysis $t_{1/2} = 15 \text{ h}$ and photooxidation $t_{1/2} = 16\text{--}17 \text{ h}$ for reactions with hydroxyl radical in air (Howard 1990);

photooxidation $t_{1/2} = 4.6\text{--}45.5 \text{ h}$, based on measured rate data for the vapor phase reaction with hydroxyl radical (Atkinson 1985; selected, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be 1 to 5 d (Kelly et al. 1994).

Surface water: estimated volatilization $t_{1/2} = 15\text{--}33 \text{ h}$ (Howard 1990);

$t_{1/2} = 24\text{--}168 \text{ h}$, based on unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 48\text{--}336 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

12.1.2.6 2-Hexanone (Methyl butyl ketone)

Common Name: Methyl butyl ketone

Synonym: 2-hexanone, methyl *n*-butyl ketone

Chemical Name: 2-hexanone, methylbutyl ketone

CAS Registry No: 591-78-6

Molecular Formula: C₆H₁₂O, CH₃COCH₂CH₂CH₂CH₃

Molecular Weight: 100.158

Melting Point (°C):

–55 (Lide 2003)

Boiling Point (°C):

127.6 (Lide 2003)

Density (g/cm³ at 20°C):

0.8113 (Weast 1982–83)

0.8113, 0.8067 (20°C, 25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

124.2 (calculated-density, Hoy 1970; Amidon & Williams 1982)

140.6 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

–8.30 (pK_a, Riddick et al. 1986)

25.30 (pK_s, Riddick et al. 1986)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

3.56 (Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

14523* (30°C, shake flask-interferometer, measured range 10–50°C, Gross et al. 1939)

16400* (shake flask-volumetric method, measured range 20–30°C, Ginnings et al. 1940)

16400 (shake flask-volumetric, Ginnings et al. 1940)

16000 (Erichsen 1952)

23930 (shake flask-interferometer, Donahue & Bartell 1952)

15870 (estimated, McGowan 1954)

16620 (Deno & Berkheimer 1960)

35000 (20°C, Verschueren 1983)

17500 (20°C, Riddick et al. 1986)

15100*, 13700 (19.8°C, 29.7°C, shake flask-GC, measured range 0–91.5°C, Stephenson 1992)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

514.4* (interpolated-regression of tabulated data, temp range 7.7–212.6°C, Stull 1947)

log (P/mmHg) = [–0.2185 × 12358.3/(T/K)] + 9.642791; temp range 7.7–127.5°C, (Antoine eq., Weast 1972–73)

1549* (ebulliometry-fitted to Antoine eq., Ambrose et al. 1975a)

509.8 (calculated-Cox eq., Chao et al. 1983)

266.6 (20°C, Verschueren 1983)

1540 (extrapolated-Antoine eq., Boublik et al. 1984)

log (P/kPa) = 6.15217 – 1395.406/(208.946 + t/°C), temp range 34.61–154.6°C (Antoine eq. from reported exptl. data of Ambrose et al. 1975, Boublik et al. 1984)

1549 (Riddick et al. 1986)

log (P/kPa) = 6.16230 – 1401.738/(209.646 + t/°C), temp range not specified (Antoine eq., Riddick et al. 1986)

1715, 1540 (interpolated-Antoine eq.-I and II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.4127 - 1575.5/(-43.15 + T/\text{K})$, temp range 293–411 K, (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.14816 - 1392.968/(-64.465 + T/\text{K})$, temp range 279–423 K, (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.15949 - 1399.959/(-63.704 + T/\text{K})$, temp range 310–427 K, (Antoine eq.-III, Stephenson & Malanowski 1987)

1600 (computed-expert system SPARC, Kolling 1995)

$\log (P/\text{mmHg}) = 4.0508 - 2.6276 \times 10^3/(T/\text{K}) + 3.7783 \cdot \log (T/\text{K}) - 1.4342 \times 10^{-2} \cdot (T/\text{K}) + 8.0592 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 217–587 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$):

9.69 (calculated-P/C, Meylan & Howard 1991)

11.8 (calculated-bond contribution, Meylan & Howard 1991)

9.70 (calculated-P/C, Howard 1993)

8.82 (computed-expert system SPARC, Kolling 1995)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.38 (shake flask-UV, Iwasa et al. 1965; Leo et al. 1971; Hansch & Leo 1979)

1.29 (calculated- π constant, Hansch et al. 1968)

1.39 (HPLC- k' correlation, Haky & Young 1984)

1.19 (shake flask-GC, Tanii et al. 1986)

1.38 (recommended, Sangster 1989, 1993)

1.38 (recommended, Hansch et al. 1995)

1.30 (computed-expert system SPARC, Kolling 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.68 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

0.778 (estimated- K_{OW} , Lyman et al. 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

1.322 (soil, estimated- K_{OW} , Lyman et al. 1990)

2.127 (soil, estimated-S, Lyman et al. 1990)

1.10 (computed- K_{OW} , Kolling 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} \sim 135$ h from a model environmental pond of 2 m deep (USEPA 1987; quoted, Howard 1993); using Henry's law constant, $t_{1/2} \sim 12.1$ H from a model river of 1 m deep flowing at 1 m/s with a wind speed of 3 m/s (Lyman et al. 1990; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation half-life of 2.4–24 h for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{OH} = (6.81 \pm 0.29) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $(299 \pm 2) \text{ K}$ (relative rate technique to cyclohexane, Atkinson et al. 1982; quoted, Atkinson 1985)

$k_{OH}(\text{calc}) = 7.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 8.97 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH} = 9.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH} = 9.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 25°C, which corresponds to a half-life of 42 h at an atmospheric OH- concn of $5 \times 10^5 \text{ molecule cm}^{-3}$ (quoted, Howard 1993)

$k_{OH}(\text{calc}) = 10.57 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation: half-life of approximately 5 d in acclimated mixed microbial culture (Howard 1993).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 2.4\text{--}24$ h for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

estimated $t_{1/2} \sim 42$ h for the vapor-phase reaction with OH radical is 42 h at an atmospheric OH- concentration of 5×10^5 molecule·cm⁻³ (Atkinson 1985; quoted, Howard 1993).

Surface water: volatilization $t_{1/2} = 12.1$ h from a model river, 135 h from a model environmental pond (Howard 1993).

Ground water:

Sediment:

Soil:

Biota:

12.1.2.7 2-Heptanone

Common Name: 2-Heptanone

Synonym: methyl *n*-amyl ketone, methyl pentyl ketone

Chemical Name: 2-heptanone

CAS Registry No: 110-43-0

Molecular Formula: $C_7H_{14}O$, $CH_3(CH_2)_4COCH_3$

Molecular Weight: 114.185

Melting Point ($^{\circ}C$):

−35 (Lide 2003)

Boiling Point ($^{\circ}C$):

151.05 (Lide 2003)

Density (g/cm^3):

0.81537, 0.81123 (20 $^{\circ}C$, 25 $^{\circ}C$, Riddick et al. 1986)

Dissociation Constant:

Molar Volume (cm^3/mol):

141.5 (30 $^{\circ}C$, Stephenson & Malanowski 1987)

162.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25 $^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at 25 $^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

4300* (25 $^{\circ}C$, volumetric method, measured range 20–30 $^{\circ}C$, Ginnings et al. 1940)

4054* (30 $^{\circ}C$, shake flask-interferometer, measured range 10–75 $^{\circ}C$, Saylor et al. 1942)

4546 (estimated, McGowan 1954)

4300 (Riddick et al. 1986)

4360* (19.7 $^{\circ}C$, shake flask-GC/TC, measured range 0–90.5 $^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at 25 $^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

521 (interpolated-vapor pressure eq., temp range 4–75 $^{\circ}C$, Stuckey & Saylor 1940)

$\log (P/mmHg) = 7.36537 - 1650.47/(T/K - 54.48)$; temp range 4–75 $^{\circ}C$ (Antoine eq., Ramsay-Young method-Hg manometer, Stuckey & Saylor 1940)

709* (30 $^{\circ}C$, measured range 10–75 $^{\circ}C$, Saylor et al. 1942)

133.3* (19.3 $^{\circ}C$, summary of literature data, temp range 19.3–150.2 $^{\circ}C$, Stull 1947)

$\log (P/mmHg) = 5.95166 - 1408.13/(194.84 + t/^{\circ}C)$; temp range 36 to 151 $^{\circ}C$ (data fitted to Antoine eq., static method-Ramsay-Young apparatus measurements, Meyer & Wagner 1966)

$\log (P/mmHg) = [-0.2185 \times 12478.9/(T/K)] + 9.305642$, temp range 19.3–150.2 $^{\circ}C$, (Antoine eq., Weast 1972–73)

427* (ebulliometry-fitted to Antoine eq., Ambrose et al. 1975a)

$\log (P/mmHg) = [1 - 400.348/(T/K)] \times 10^{\{0.934881 - 4.87941 \times 10^{-4} \cdot (T/K) + 4.16258 \times 10^{-7} \cdot (T/K)^2\}}$; temp range 280.85–400.65 K, (Cox eq., Chao et al. 1983)

514 (Abraham 1984; Riddick et al. 1986)

504 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.14611 - 1460.276/(201.636 + t/^{\circ}C)$, temp range 94.7–179.3 $^{\circ}C$ (Antoine eq. from reported exptl. data of Ambrose et al. 1975, Boublik et al. 1984)

469 (extrapolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.07656 - 1408.73/(-78.31 + T/K)$, temp range 303–424 K, (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.15178 - 1464.092/(-71.076 + T/\text{K})$, temp range 327–457 K, (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.56718 - 1810.283/(-26.944 + T/\text{K})$, temp range 449–580 K, (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = -13.0256 - 2.6425 \times 10^3/(T/\text{K}) + 11.879 \cdot \log (T/\text{K}) - 2.7571 \times 10^{-2} \cdot (T/\text{K}) + 1.456 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 238–612 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

14.63 (partial vapor pressure-GC, Buttery et al. 1969)

14.6; 14.94, 14.6 (exptl.; calculated-group contribution, bond contribution, Hine & Mookerjee 1975)

5.715 (calculated-activity coefficient γ_P , Rathbun & Tai 1982)

9.120 (calculated-P/C, Mackay & Yuen 1983)

16.0 (correlated-molecular structure, Russell et al. 1992)

17.1 (gas stripping-GC, Shiu & Mackay 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.08 (calculated-activity coefficients, Wasik et al. 1981)

1.98 (generator column-HPLC, Tewari et al. 1982)

2.00 (shake flask-GC, Tani et al. 1986)

2.03 (calculated-UNIFAC activity coefficients, Dallos et al. 1993)

1.98 (recommended, Sangster 1993)

1.98 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

4.15 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

12.1.2.8 Cyclohexanone

Common Name: Cyclohexanone

Synonym:

Chemical Name: cyclohexanone

CAS Registry No: 108-94-1

Molecular Formula: C₆H₁₀O

Molecular Weight: 98.142

Melting Point (°C):

-27.9 (Lide 2003)

Boiling Point (°C):

155.43 (Lide 2003)

Density (g/cm³ at 20°C):

0.9478 (Weast 1982–83; Dean 1985)

0.9452 (Riddick et al. 1986)

Molar Volume (cm³/mol):

106.2 (calculated-density, Stephenson & Malanowski 1987)

118.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

Entropy of Fusion ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56$ J/mol K, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

23000 (Riddick et al. 1986)

93200 (selected, Yaws et al. 1990)

97000*, 82000 (19.5°C, 29.8°C, shake flask-GC, measured range 0–90.7°C, Stephenson 1992)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

666.6* (26.4°C, summary of literature data, temp range 1.4–155.6°C, Stull 1947)

$\log (P/\text{mmHg}) = [-0.2185 \times 10037.6/(T/K)] + 8.019908$; temp range 1.4–155.6°C, (Antoine eq., Weast 1972–73)

533* (ebulliometry-fitted to Antoine eq., temp range 89.6–165.8°C, Meyer & Hotz 1973)

$\log (P/\text{mmHg}) = 5.978401 - 1495.511/(209.5517 + t/^{\circ}\text{C})$; temp range 89.6–165.8°C (Antoine eq. ebulliometric measurements, Meyer & Hotz 1973)

614 (interpolated-Cox eq., Chao et al. 1983)

$\log (P/\text{mmHg}) = [1 - 428.587/(T/K)] \times 10^{0.833332 - 6.42578 \times 10^{-4} \cdot (T/K) + 7.09855 \times 10^{-7} \cdot (T/K)^2}$; temp range: 274.55–438.92 K (Cox eq., Chao et al. 1983)

533 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.10133 - 1494.166/(209.399 + t/^{\circ}\text{C})$, temp range 89.29–165.8°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

640 (Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.103304 - 1495.511/(209.5517 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)

620, 534 (calculated-Antoine eq.-I, extrapolated-Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_s/\text{kPa}) = 8.434 - 2576.6/(T/K)$; temp range not specified (Antoine eq., solid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.103304 - 1495.511/(-63.5983 + T/K)$, temp range 362–439 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 70.5022 - 4.412 \times 10^3/(T/K) - 23.605 \cdot \log (T/K) + 1.1205 \times 10^{-2} \cdot (T/K) - 1.5648 \times 10^{-13} \cdot (T/K)^2$; temp range 242–629 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

1.216	(Hawthorne et al. 1985)
2.266	(calculated-P/C, Meylan & Howard 1991)
5.179	(estimated-bond contribution, Meylan & Howard 1991)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.81	(shake flask, Hansch & Leo 1979, 1985, 1987)
0.81	(recommended, Sangster 1989, 1993)
0.81	(recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

0.39	(calculated- K_{OW} with regression eq., Lyman et al. 1982; quoted, Howard 1990)
------	---

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

1.00	(calculated-S, K_{OW} with regression eq., Roy & Griffin 1985; quoted, Howard 1990)
------	--

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} \sim 3.1$ d from a model river 1-m deep flowing 1 m s^{-1} with wind velocity of 3 m s^{-1} (Lyman et al. 1982; quoted, Howard 1990).

Photolysis: direct sunlight photolysis rate constant of about 0.16 d^{-1} corresponding to $t_{1/2} = 4.3$ d (Mill & Davenport 1986; quoted, Howard 1990).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 24$ h to 9.9 d in air for the gas-phase reaction with OH radical, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{\text{OH}} = 1.56 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 25°C with $t_{1/2} \sim 1$ d (Atkinson 1985; quoted, Howard 1990)

$k_{\text{OH}} = 6.39 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1989)

$k_{\text{OH}} = 12.55 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ from Atmospheric Oxidation Program, $k_{\text{OH}}(\text{exptl}) = 6.39 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $k_{\text{OH}}(\text{calc}) = 2.92 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ from Fate of Atmospheric Pollutants Program, (Meylan & Howard 1993)

$k_{\text{OH}}(\text{calc}) = 5.09 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation: average rate of biodegradation $51.5 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 24$ h to 9.9 d in air for the gas-phase reaction with hydroxyl radicals, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radicals (Darnall et al. 1976);

degrade rapidly by reaction with sunlight produced hydroxyl radicals with $t_{1/2} \sim 1$ d and by direct sunlight photolysis with $t_{1/2} \sim 4.3$ d (Howard 1990).

Surface water: estimated $t_{1/2} \sim 0.003$ yr at Noordwijk (Zoeteman et al. 1981).

Ground water:

Sediment:

Soil:

Biota:

12.1.2.9 Acetophenone

Common Name: Acetophenone

Synonym: 1-phenylethanone, methyl phenyl ketone, acetylbenzene, phenylmethylketone, hyponone

Chemical Name: acetophenone, methyl phenyl ketone

CAS Registry No: 98-86-2

Molecular Formula: C_8H_8O , $C_6H_5COCH_3$

Molecular Weight: 120.149

Melting Point ($^{\circ}C$):

20.5 (Stull 1947; Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

202 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0281 (Dreisbach 1955; Weast 1982–83; Riddick et al. 1986)

1.02382 ($25^{\circ}C$, Dreisbach 1955; Riddick et al. 1986)

Molar Volume (cm^3/mol):

117.1 (calculated-density, Rohrschneider 1973)

140.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

42.0, 53.41 (normal bp, $25^{\circ}C$, Dreisbach 1955)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

16.65 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion ΔS_{fus} ($J/mol K$):

42.26 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

5530 (shake flask-centrifuge, Booth & Everson 1948)

6300 (shake flask-UV, Andrews & Keefer 1950)

6022 (estimated, McGowan 1954)

5540 ($24^{\circ}C$, shake flask-LSC, Means et al. 1980)

5500 (Verschuereen 1983; Dean 1985, 1992)

6130 (Southworth & Keller 1986)

5620* ($19.9^{\circ}C$, shake flask-GC/TC, measured range 19.9 – $80.1^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

266.6* ($50.2^{\circ}C$, static method-manometer, measured range 50.2 – $201.5^{\circ}C$, Kahlbaum 1898)

66.21* (extrapolated-regression of tabulated data, temp range 37.1 – $202.4^{\circ}C$, Stull, 1947)

49.53 (calculated-Antoine eq., Dreisbach 1955)

$\log (P/mmHg) = 7.15738 - 1723.46/(201.0 + t/^{\circ}C)$; temp range 102 – $330^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

41.30 (Hoy 1970)

$\log (P/mmHg) = [-0.2185 \times 11731.5/(T/K)] + 8.293248$; temp range 37.1 – $202.4^{\circ}C$ (Antoine eq., Weast 1972–73)

57.48 (extrapolated-Cox eq., Chao et al. 1983)

$\log (P/mmHg) = [1 - 474.823/(T/K)] \times 10^{0.859974 - 6.15392 \times 10^{-4} \cdot (T/K) + 6.99110 \times 10^{-7} \cdot (T/K)^2}$; temp range 310.25 – $475.55 K$ (Cox eq., Chao et al. 1983)

52.92 (Daubert & Danner 1985)

40.23 (extrapolated-Antoine eq., Dean 1985)

- log (P/mmHg) = $9.1352 - 2878.8/(T/K)$; temp range 20–100°C (Antoine eq., Dean 1985, 1992)
 49.0 (Riddick et al. 1986)
 log (P/kPa) = $6.28228 - 1723.46/(201.0 + t/°C)$, temp range not specify (Antoine eq., Riddick et al. 1986)
 45.3 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
 log (P_L /kPa) = $6.28228 - 1723.46/(-72.15 + T/K)$; temp range 375–603 K (Antoine eq., Stephenson & Malanowski 1987)
 45.00 (selected, Mackay et al. 1992, 1995; quoted, Shiu & Mackay 1997)
 log (P/mmHg) = $55.5798 - 4.5101 \times 10^3/(T/K) - 17.284 \cdot \log (T/K) + 6.4184 \times 10^{-3} \cdot (T/K) + 6.5557 \times 10^{-13} \cdot (T/K)^2$;
 temp range 293–701 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 1.082 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)
 0.784 (calculated-bond contribution, Hine & Mookerjee 1975)
 0.921* (25.1°C, gas stripping-GC, measured range 14.9–35°C, Betterton 1991)
 0.753 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 1.080, 0.982 (gas stripping-GC, calculated-P/C, Shiu & Mackay 1997)
 1.06* (EPICS-UV spectroscopy, measured range 5–25°C, Allen et al. 1998)
 $\ln K_{AW} = -9100/(T/K) + 22.47$ (EPICS-UV, temp range 5–25°C, Allen et al. 1998)
 0.560 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 7.307 - 3202/(T/K)$, (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, log K_{OW} :

- 1.58 (shake flask-UV, Fujita et al. 1964; quoted, Leo et al. 1969, 1971; Hansch & Leo 1985)
 1.58 (calculated- π const., Iwasa et al. 1965)
 1.73 (shake flask-UV, Chapman et al. 1972)
 1.58 (HPLC-RT correlation, Lazare et al. 1974)
 1.68 (shake flask-UV, Holmes & Lough 1976)
 1.66 ± 0.08 (shake flask at pH 7, Unger et al. 1978)
 1.66 (Hansch & Leo 1979)
 1.59 (shake flask-GC, Khan et al 1979)
 1.59 (shake flask-LSC, Means et al. 1980)
 1.58 (shake flask-HPLC, Nahum & Horvath 1980)
 1.75 (calculated-f const., Rekker's method, Hanai et al. 1981)
 1.77, 1.56 (HPLC- k' correlation, McDuffie 1981)
 1.80 (HPLC-RT correlation, Hammers et al. 1982)
 1.83 (RP-LC-RT correlation, Hanai & Hubert 1982)
 1.56 (RP-HPLC- k' correlation, Miyake & Terada 1982)
 1.63 (inter-laboratory studies, shake flask average, Eadsforth & Moser 1983)
 1.65 (inter-laboratory studies, HPLC average, Eadsforth & Moser 1983)
 1.65; 1.68 ± 0.02 (selected best lit. value; exptl.-ALPM, Garst & Wilson 1984)
 1.59; 1.72 (HPLC-RT correlation; HPLC average, Eadsforth 1986)
 1.71 (HPLC-RT correlation, Ge et al. 1987)
 1.65 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 1.60 (shake flask-CPC, Berthod et al. 1988)
 1.58 (RP-HPLC- k' correlation, Minick et al. 1988)
 1.63 (recommended, Sangster 1989, 1993)
 1.59 (CPC centrifugal partition chromatography, Gluck & Martin 1990)
 1.56 (shake flask-UV spec., Alcorn et al. 1993)
 1.58 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

- 0.699–0.954 (estimated- K_{OW} and S, Lyman et al. 1982; quoted, Howard 1993)

Sorption Partition Coefficient, log K_{OC} :

- 1.544 (average of 3 sediments and soil samples, equilibrium sorption isotherm, Means et al. 1980)
- 1.380 (calculated, Means et al. 1980)
- 1.89 (calculated-MCI χ , Gerstl & Helling 1987)
- 1.630 (soil, quoted, Sabljic 1987)
- 1.73 (RP-HPLC- k' correlation, cyanopropyl column, Hodson & Williams 1988)
- 1.34–2.43 (soils and sediments, quoted exptl. and estimated values, Howard 1993)
- 1.26 (calculated- K_{OW} , Kollig 1993)
- 1.54 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
- 1.79, 1.63 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)
- 1.61, 1.50, 1.80 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, average, Delle Site 2001)
- 1.56, 1.55 (sediments: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: based on calculated Henry's law constant, $t_{1/2} \sim 3.8$ d from a model river of 1-m deep flowing at 1 m s^{-1} with a wind velocity of 3 m s^{-1} (Lyman et al. 1982; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$$k_{OH} = (2.74 \pm 0.15) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1} \text{ at } 298 \text{ K (Atkinson 1989)}$$

$k_{OH}(\text{calc}) = 1.61 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ estimated from Atmospheric Oxidation Program; $k_{OH}(\text{exptl}) = 2.74 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ estimated from Fate of Atmospheric Pollutants Program with OH radical in vapor phase (Meylan & Howard 1993)

$k_{OH}(\text{calc}) = 0.74 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{exptl}) = 2.74 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (SAR structure-activity relationship, Kwok & Atkinson 1995)

Hydrolysis:

Biodegradation: biodegradation rate constant $k = 0.029\text{--}0.042 \text{ h}^{-1}$ in 30 mg L^{-1} activated sludge after a time lag of 15–20 h (Urano & Kato 1986b);

rate constants: $k = 0.022 \text{ d}^{-1}$ in ground water, $k = 0.083 \text{ d}^{-1}$ in river waters and $k = 0.155 \text{ d}^{-1}$ in Superior harbor waters (Vaishnav & Babeu 1987).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: estimated photooxidation $t_{1/2} \sim 22$ d in atmosphere, based on the vapor-phase reaction with photochemically produced hydroxyl radical in air (Atkinson 1988; quoted, Howard 1993); atmospheric transformation lifetime was estimated to be 1 to 5 d (Kelly et al. 1994).

Surface water: biodegradation $t_{1/2} = 8$ d in river water and $t_{1/2} = 4.5$ d in lake water (Vaishnav & Babeu 1986, 1987; quoted, Howard 1993) and $t_{1/2} = 4$ d in Superior harbor waters (Vaishnav & Babeu 1987).

Ground water: biodegradation $t_{1/2} = 32$ d (Vaishnav & Babeu 1986, 1987; quoted, Howard 1993); estimated $t_{1/2} \sim 0.01$ yr at Noordwijk (Zoeteman et al. 1981).

12.1.2.10 Benzophenone

Common Name: Benzophenone

Synonym: diphenyl ketone, diphenyl methanone

Chemical Name: benzophenone, diphenyl ketone

CAS Registry No: 119-61-9

Molecular Formula: $C_{13}H_{10}O$, $C_6H_5COC_6H_5$

Molecular Weight: 182.217

Melting Point ($^{\circ}C$):

48.1 (α , Weast 1982–83; Dean 1985)

26.0 (β , Weast 1982–83; Dean 1985)

47.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

305.4 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.6077 (α , $19^{\circ}C$, Weast 1982–83)

1.6059 (β , $23^{\circ}C$, Weast 1982–83)

1.111 ($18^{\circ}C$, Lide 2003)

Molar Volume (cm^3/mol):

206.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

Enthalpy of Vaporization, ΔH_v (kJ/mol):

53.38, 81.90 (normal bp, $25^{\circ}C$, Dreisbach 1955)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

16.99 (Dreisbach 1955)

13.36 (Yalkowsky & Valvani 1980)

Entropy of Fusion ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.596 (mp at $47.9^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

20720, 21000 (calculated- ΔS_{fus} and mp, estimated, Yalkowsky & Valvani 1980)

276 (calculated-intrinsic molar volume V_1 and solvatochromic parameters, Leahy 1986)

77.7 (calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

33330* ($257.15^{\circ}C$, temp range 257.15 – $302.85^{\circ}C$, Jaquerod & Wassher 1904; quoted, Boublik et al. 1984)

0.617* (extrapolated-regression tabulated data, temp range 108.3 – $305.5^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.81086 - 2643.0/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

6287* ($200.50^{\circ}C$, ebulliometry, measured range 200.50 – $306.1^{\circ}C$, Dreisbach & Shrader 1949)

1.242 (calculated by formula, Dreisbach 1955)

$\log(P/mmHg) = 7.28937 - 2144.6/(181.0 + t/^{\circ}C)$; temp range 1980 – $600^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

$\log(P/mmHg) = [-0.2185 \times 14725.4/(T/K)] + 8.456678$; temp range 108.2 – $305.4^{\circ}C$ (Antoine eq., Weast 1972–73)

3.146* ($55.9^{\circ}C$, effusion method, measured range 55.9 – $71.2^{\circ}C$, DePablo 1976)

0.086, 0.0115 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.2931 - 2056.386/(173.545 + t/^{\circ}C)$, temp range 200.5 – $306.1^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 6.37814 - 2127.915/(181.209 + t/^{\circ}C)$, temp range 257.1 – $302.8^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

0.080 (extrapolated-Antoine eq., Dean 1985)

$\log (P/\text{mmHg}) = 7.34966 - 2331.4/(195.0 + t/^{\circ}\text{C})$, temp range 48–202°C (Antoine eq., Dean 1985, 1992)

$\log (P/\text{mmHg}) = 7.16294 - 2051.855/(173.074 + t/^{\circ}\text{C})$; temp range 200–306°C (Antoine eq., Dean 1985, 1992)

0.086, 0.095 (interpolated-eq.-I and II, Stephenson & Malanowski 1987)

$\log (P_s/\text{kPa}) = 12.44989 - 4924.329/(T/\text{K})$; temp range 293–318 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)

$\log (P_s/\text{kPa}) = 11.736 - 4698/(T/\text{K})$; temp range 298–318 K (Antoine eq.-II, solid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.41427 - 2144.6/(-92.15 + T/\text{K})$; temp range 433–673 K (Antoine eq.-III, liquid, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 16.4144 - 3.8064 \times 10^3/(T/\text{K}) - 2.3984 \cdot \log (T/\text{K}) - 7.4544 \times 10^{-4} \cdot (T/\text{K}) + 2.9345 \times 10^{-7} \cdot (T/\text{K})^2$; temp range 321–816 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.18 (shake flask-UV, Leo et al. 1971)

3.58 (shake flask-UV, Holmes & Lough 1976)

3.10 (shake flask-UV, Unger & Chiang 1981)

3.02 (HPLC- k' correlation, McDuffie 1981)

3.03 (RP-HPLC-RT correlation, ODS column with masking agent, Bechalany et al. 1989)

3.18 (recommended, Sangster 1989, 1993)

3.18 (recommended, Hansch et al. 1995)

3.09 (microemulsion electrokinetic chromatography-retention factor correlation, Poole et al. 2000)

3.32 (RP-HPLC-RT correlation using short ODP column, Donovan & Pescatore 2002)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{oc}$:

2.63 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

TABLE 12.1.2.10.1

Reported vapor pressures of benzophenone at various temperatures and the coefficients for the vapor pressure equations

$$\log P = A - B/(T/K) \quad (1) \qquad \ln P = A - B/(T/K) \quad (1a)$$

$$\log P = A - B/(C + t/^{\circ}\text{C}) \quad (2) \qquad \ln P = A - B/(C + t/^{\circ}\text{C}) \quad (2a)$$

$$\log P = A - B/(C + T/K) \quad (3)$$

$$\log P = A - B/(T/K) - C \cdot \log (T/K) \quad (4)$$

TABLE 12.2.3

Suggested half-life classes for aldehydes and ketones at various environmental compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Aldehydes:				
Methanal (Formaldehyde)	1	3	3	4
Ethanal (Acetaldehyde)	1	3	3	4
Propanal (Propionaldehyde)	1	3	3	4
Butanal (<i>n</i> -Butyraldehyde)	1	3	3	4
2-Propenal (Acrolein)	1	3	3	4
2-Butenal	1	3	3	4
Furfural (2-Furaldehyde)	1	3	3	4
Benzaldehyde	1	3	3	4
Ketones:				
Acetone	4	3	4	5
2-Butanone (Methyl ethyl ketone)	4	3	3	5
2-Pentanone	3	4	4	5
3-Pentanone	3	4	4	5
Methyl isobutyl ketone (MIBK)	3	4	4	5
2-Hexanone	3	4	4	5
2-Heptanone	3	4	4	5
Cyclohexanone	3	4	4	5
Acetophenone	5	4	4	5
Benzophenone	5	4	4	5

where,

Class	Mean half-life (hours)	Range (hours)
1	5	< 10
2	17 (~ 1 day)	10–30
3	55 (~ 2 days)	30–100
4	170 (~ 1 week)	100–300
5	550 (~ 3 weeks)	300–1,000
6	1700 (~ 2 months)	1,000–3,000
7	5500 (~ 8 months)	3,000–10,000
8	17000 (~ 2 years)	10,000–30,000
9	~ 5 years	> 30,000

13.1 LIST OF CHEMICALS AND DATA COMPILATIONS

13.1.1 ALIPHATIC ACIDS

13.1.1.1 Formic acid

Common Name: Formic acid

Synonym: methanoic acid

Chemical Name: formic acid

CAS Registry No: 64-18-6

Molecular Formula: CH_2O_2 , HCOOH

Molecular Weight: 46.026

Melting Point ($^{\circ}\text{C}$):

8.3 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

101 (Lide 2003)

Density (g/cm^3 at 20°C):1.21961, 1.21328 (20°C , 25°C , Dreisbach & Martin 1949)

1.2200 (Weast 1982–83; Dean 1985)

1.2141 (25°C , Riddick et al. 1986)Molar Volume (cm^3/mol):

37.7 (calculated-density, Stephenson & Malanowski 1987)

46.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :3.751 (pK_a , Dean 1985)3.752 (pK_a , Riddick et al. 1986)3.740 (pK_a , Sangster 1989)

3.800 (Kollig 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

12.68 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 13.5 \text{ J}/\text{mol K}$), F: 1.0Water Solubility (g/m^3 or mg/L at 25°C):

miscible (Dean 1985)

miscible (Riddick et al. 1986)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

4344* (24.6°C , temp range 21.8 – 100.6°C , Kahlbaum 1894)5333* (24°C , compiled and evaluated data, temp range -20 to 100.6°C , Stull 1947) $\log(P/\text{mmHg}) = 7.15689 - 1414.1/(230 + t/^{\circ}\text{C})$ (Antoine eq., Dreisbach & Martin 1949)10114* (37.75°C , ebulliometry, measured range 37.75 – 100.7°C , Dreisbach & Shrader 1949) $\log(P/\text{mmHg}) = [-0.2185 \times 9896.5/(T/\text{K})] + 8.779337$; temp range -20 to 100.6°C (Antoine eq., Weast 1972–73)4666, 7198 (20°C , 30°C , Verschuereen 1983)

5720, 5744, 4420 (calculated-Antoine eq., Boublik et al. 1984)

 $\log(P/\text{kPa}) = 4.09278 - 539.775/(136.826 + t/^{\circ}\text{C})$; temp range 0.5 – 34.2°C (Antoine eq. from reported exptl. data, Boublik et al. 1984) $\log(P/\text{kPa}) = 6.69157 - 1689.096/(259.726 + t/^{\circ}\text{C})$; temp range 37.35 – 100.7°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984) $\log(P/\text{kPa}) = 3.7279 - 295.021/(70.7 + t/^{\circ}\text{C})$; temp range 21 – 100.6°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

- 5744 (extrapolated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 7.5818 - 1699.2/(260.7 + t/^{\circ}\text{C})$; temp range: 37–101°C (Antoine eq., Dean 1985, 1992)
 5750 (selected, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.50280 - 1563.28/(247.06 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 5733* (comparative ebulliometry, measured range 299.8–393 K, Ambrose & Ghiassee 1987)
 $\ln (P/\text{kPa}) = 15.40560 - 3894.764/[(T/\text{K}) - 13.0]$; temp range 299.8–393 K (Antoine eq. from comparative ebulliometry measurements, Ambrose & Ghiassee 1987)
 5711 (interpolated-Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 11.611 - 3160/(T/\text{K})$; temp range 268–281 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.5028 - 1563.28/(-26.09 + T/\text{K})$; temp range 283–384 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)
 5680, 67850 (measured, calculated-solvatochromic parameters, Banerjee et al. 1990)
 $\log (P/\text{mmHg}) = 27.9278 - 2.5976 \times 10^3/(T/\text{K}) - 7.2489 \cdot \log (T/\text{K}) + 6.411 \times 10^{-10} \cdot (T/\text{K}) + 3.9421 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 282–580 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C and reported temperature dependence equations):

- 0.0181 (calculated, Keene & Galloway 1986)
 0.0274 (calculated, Jacob 1986)
 0.017 (pH 4, Gaffney et al. 1987)
 0.112 (computed-vapor liquid equilibrium VLE data, Yaws et al. 1991)
 0.0076, 0.0098, 0.0178 (24°C, bubble column technique, concn: of 1, 10, 10⁵ ppm, Servant et al. 1991)
 0.0281 (Betterton 1992)
 0.018 (equilibrium partial pressure, pH 1.6–1.9, Khan & Brimblecombe 1992)
 $\ln [k_H/(\text{mol kg}^{-1} \text{atm}^{-1})] = -10.31 + 5634/(T/\text{K})$, temp range 178.15–308.15 K (equilibrium partial pressure, Khan & Brimblecombe 1992)
 0.0183 (equilibrium partial pressure, pH 5.4, Khan et al. 1995)
 0.018–0.028 (calculated-thermodynamic data, Johnson et al. 1996)
 0.0118, 0.00921 (counter-flow packed column technique-ion chromatography; "best" exptl. value, Johnson et al. 1996)
 $\ln [k_H/(\text{M/atm})] = -11.04 + 6100/(T/\text{K})$; temp range 2–35°C (counter-flow packed column measurements, Johnson et al. 1996)
 0.0137 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 0.0107 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 2.914 - 2425/(T/\text{K})$, (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- −0.54 (shake flask-titration, Collander 1951; quoted, Leo et al. 1971; Hansch et al. 1972; Hansch & Leo 1979)
 −0.54 (shake flask-titration, Whitehead & Geankoplis 1955)
 −0.46 (calculated-f const., Rekker & de Kort 1979)
 −0.54 (recommended, Sangster 1989)
 −0.54 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

- −0.27 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{\text{OH}} = (3.2 \pm 1.0) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-resonance fluorescence, Zetzsch & Stuhl 1982)

$k = (100 \pm 20) \text{ M}^{-1} \text{ s}^{-1}$ at pH 8; $(5 \pm 5) \text{ M}^{-1} \text{ s}^{-1}$ for protonated species; $(100 \pm 20) \text{ M}^{-1} \text{ s}^{-1}$ for non-protonated species for the reaction with ozone in water using 1 mM propyl alcohol as scavenger at pH 2.0–4.0 and 20–23°C (Hoigné & Bader 1983b)

$k_{\text{OH}}^* = 4.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 298–430 K (flash photolysis-resonance fluorescence, Wine et al. 1985)

$k_{\text{OH}} = (2.95 \pm 0.07) \times 10^{11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ or $4.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (flash photolysis-resonance absorption, Jolly et al. 1986)

$k_{\text{OH}} = (3.7 \pm 0.4) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-RF, Dagaut et al. 1988)

$k_{\text{OH}}^* = (2.69 \pm 0.17) \times 10^{11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ or $4.47 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 297 K, measured range 297–445 K (laser photolysis-resonance absorption, Singleton et al. 1988)

$k_{\text{OH}} = 3.7 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k(\text{soln}) = 2.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with hydroxyl radical in aqueous solution (Wallington et al. 1988)

$k_{\text{OH}}^* = 4.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 7.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Biodegradation:

FIGURE 13.1.1.1.1 Logarithm of vapor pressure versus reciprocal temperature for formic acid.

13.1.1.2 Acetic acid

Common Name: Acetic acid

Synonym: ethanoic acid, methanecarboxylic acid, glacial acetic, vinegar acid

Chemical Name: acetic acid

CAS Registry No: 64-19-7

Molecular Formula: CH_3COOH

Molecular Weight: 60.052

Melting Point ($^{\circ}\text{C}$):

16.64 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

117.9 (Weast 1982–83; Dean 1985; Riddick et al. 1986; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at 20°C):

1.04923, 1.04365 (20°C , 25°C , Dreisbach & Martin 1949)

1.0492 (Weast 1982–83; Dean 1985)

Molar Volume (cm^3/mol):

57.1 (calculated-density, Rohrschneider 1973)

68.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.733 (pK_a , Korman & La Mer 1936)

4.760 (pK_a , Fieser & Fieser 1958; Sangster 1989)

4.750 (pK_a , Weast 1982–83; Howard 1990)

4.756 (pK_a , Dean 1985; Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.72 (Ambrose et al. 1977; Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C):

miscible (Dean 1985; Riddick et al. 1986)

miscible (Yaws et al. 1990)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2040* (interpolated-regression of tabulated data, temp range -17.2 – 118°C , Stull 1947)

$\log(P/\text{mmHg}) = 7.45144 - 1589.3/(230 + t/^{\circ}\text{C})$ (Antoine eq., Dreisbach & Martin 1949)

10114* (55.75°C , ebulliometry, measured range 55.75 – 117.72°C , Dreisbach & Shrader 1949)

2666* (29.8°C , static method-manometer, measured range 29.8 – 126.45°C , Potter & Ritter 1954)

8297* (52.36°C , ebulliometry, measured range 52.36 – 118.14°C , McDonald et al. 1959)

$\log(P/\text{mmHg}) = 7.55716 - 1642.54/(233.386\text{C} + t/^{\circ}\text{C})$; temp range 52 – 118°C (ebulliometry, McDonald et al. 1959)

2105 (calculated by formula, Dreisbach 1961)

$\log(P/\text{mmHg}) = 7.18807 - 1416.7/(211 + t/^{\circ}\text{C})$, temp range 36 – 170°C , (Antoine eq. for liquid state, Dreisbach 1961)

2030 (Hoy 1970)

$\log(P/\text{mmHg}) = [-0.2185 \times 9963.9/(T/\text{K})] + 8.50200$; temp range -35 to 10°C (Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 9486.6/(T/\text{K})] + 8.142405$; temp range -17.2 to 312.5°C (Antoine eq., Weast 1972–73)

2079* (ebulliometry, fitted to Antoine eq., measured range 304.065 – 415.041 K , Ambrose et al. 1977)

$\log(P/\text{kPa}) = 6.66686 - 1633.288/[(T/\text{K}) - 40.626]$; temp range 351.347 – 415.041 K (Antoine eq.-I, ebulliometry, Ambrose et al. 1977)

- $\log (P/\text{kPa}) = 6.59795 - 1587.182/\{(T/\text{K}) - 45.392\}$; temp range 304.065–415.041 K (Antoine eq.-II, ebulliometry, Ambrose et al. 1977)
 1520, 2666 (20°C, 30°C, Verschuereen 1983)
 2088 (extrapolated average-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.5039 - 1527.764/(221.742 + t/^{\circ}\text{C})$, temp range 29.8–126.45°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.72515 - 1670.427/(236.091 + t/^{\circ}\text{C})$, temp range 52.36–118.1°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 2050 (calculated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 7.38782 - 1533.313/(222.309 + t/^{\circ}\text{C})$, temp range: liquid (Antoine eq., Dean 1985, 1992)
 2079 (Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.66686 - 1633.288/(232.885 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 2076 (comparative ebulliometry data, Ambrose & Ghassee 1987)
 $\ln (P/\text{kPa}) = 15.19234 - 3654.622/[(T/\text{K}) - 45.392]$ (Antoine eq. Ambrose & Ghassee 1987)
 2114 (calculated-Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 7.672 - 2177/(T/\text{K})$, temp range: 238–283 K, (solid, Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 9.9268 - 2847/(T/\text{K})$; temp range 243–289 K (solid, Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.68206 - 1642.54/(-39.764 + T/\text{K})$; temp range 289–392 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.39226 - 2258.22/(2762 + T/\text{K})$; temp range 391–550 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.5729 - 1572.32/(-46.777 + T/\text{K})$; temp range 290–396 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.82561 - 1748.572/(-28.259 + T/\text{K})$; temp range 391–447 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.22638 - 2010.805/(12.244 + T/\text{K})$; temp range 437–535 K (Antoine eq.-VII, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 8.44129 - 3628.409/(182.674 + T/\text{K})$; temp range 525–593 K (Antoine eq.-VIII, Stephenson & Malanowski 1987)
 1520, 32660 (measured, calculated-solvatochromic parameters., Banerjee et al. 1990)
 $\log (P/\text{mmHg}) = 28.3756 - 2.9734 \times 10^3/(T/\text{K}) - 7.032 \cdot \log (T/\text{K}) - 1.5051 \times 10^{-9} \cdot (T/\text{K}) + 2.1806 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 290–593 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$) at 25°C and reported temperature dependence equations):

- 0.0303 (partial pressure, Butler & Ramchandani 1935)
 0.0305 (exptl., Hine & Mookerjee 1975)
 0.0300, 0.0280 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 0.0115 (calculated, Keene & Galloway 1986)
 0.0101 (effective Henry's law constant, pH 4, Gaffney et al. 1987)
 0.0254 (calculated-MCI χ , Nirmalakhandan & Speece 1988)
 0.121 (computed-vapor liquid equilibrium VLE data, Yaws et al. 1991)
 0.0101, 1.01×10^{-4} (at pH 4, pH 7, Howard 1990)
 0.0109, 0.00905, 0.0158 (23°C, bubble column technique, concn: 1, 10, 10^5 ppm. Servant et al. 1991)
 0.0184 (equilibrium partial pressure, pH 1.6–1.9, Khan & Brimblecombe 1992)
 $\ln [K_H/(\text{mol kg}^{-1} \text{ atm}^{-1})] = -25.67 + 8322/(T/\text{K})$, temp range 278.15–303.15 K (equilibrium partial pressure, Khan & Brimblecombe 1992)
 0.0285 (calculated-bond contribution, Brimblecombe et al. 1992)
 0.0431 (calculated-molecular structure, Russell et al. 1992)
 0.0182 (equilibrium partial pressure, pH 5.4, Khan et al. 1995)
 0.0115–0.0195 (calculated-thermodynamic data, Johnson et al. 1996)
 0.0245, 0.0145 (counter-flow packed column technique-ion chromatography; "best" exptl value, Johnson et al. 1996)

$\ln [K_H/(M/atm)] = -12.5 + 6200/(T/K)$, temp range 2–35°C (counter-flow packed column measurements, Johnson et al. 1996)

0.0130 (20°C, selected from literature, experimentally measured data, Staudinger & Roberts 1996)

0.0154 (20°C, selected from literature, experimentally measured data, Staudinger & Roberts 2001)

$\log K_{AW} = 3.650 - 2596/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

-0.30 (shake flask-titration, Leonard et al. 1948)

-0.31 (shake flask-titration, Collander 1951)

-0.29; -0.17 (calculated-fragment const.; calculated- π const., Rekker 1977)

-0.29 (shake flask-radiochemical method, pH 1, Wolfenden 1978)

-0.17, -0.31 (Hansch & Leo 1979)

-0.17 (shake flask, Log P Database, Hansch & Leo 1987)

-0.17 (recommended, Sangster 1989, 1993)

-0.17 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

4.31 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

< 0.0 (estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

no detectable sorption (Podzol soil, Alfisol soil, sediment, von Oepen et al. 1991)

0.00 (soil, quoted exptl., Meylan et al. 1992)

-0.21 (soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)

0.00 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (0.6 \pm 0.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with $t_{1/2} = 26.7 \text{ d}$ for the vapor-phase reaction with 5×10^5 hydroxyl radical/cm³ in air at 25°C (flash photolysis-resonance fluorescence technique, Zetzsch & Stuhl 1982; quoted, Atkinson 1985)

$k(aq.) \leq 3 \times 10^{-5} \text{ M}^{-1} \text{ s}^{-1}$ for reaction with ozone at pH 8 in water; $k \leq 3 \times 10^{-5} \text{ M}^{-1} \text{ s}^{-1}$ for protonated species, and $k \leq 3 \times 10^{-5} \text{ M}^{-1} \text{ s}^{-1}$ for non-protonated species for the reaction with ozone in water at pH 2.0–5.5 and 20–23°C (Hoigné & Bader 1983b)

$k_{OH}^* = (7.4 \pm 0.6) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 298–440 K (flash photolysis-resonance fluorescence, Dagaut et al. 1988)

$k_{OH} = 7.4 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ in air, and $k(soln) = 2.70 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with OH radical in aqueous solution (Wallington et al. 1988)

$k_{OH} = 7.4 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1990)

$k_{OH}(calc) = 0.70 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996).

Hydrolysis:

Biodegradation: > 90% degradation in 3 d using an activated sludge inoculum; in 24 h in batch aeration in sewage and 14 d using sediment from the Rhine river as inocula (Howard 1990).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 26.7 \text{ d}$, based on measured rate constant of $0.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with 5×10^5 hydroxyl radicals/cm³ in air at 25°C (Atkinson 1985; quoted, Howard 1990).

Surface water: $t_{1/2} = 26\text{--}46 \text{ yr}$, based on OH radical concn. in sunlit natural water of $1 \times 10^{-17} \text{ mol/L}$ (Howard 1990).

Groundwater:

Sediment: > 90% degradation in 14 d using Rhine River sediment as inocula (Kool 1984; quoted, Howard 1990).

Soil:

Biota:

FIGURE 13.1.1.2.1 Logarithm of vapor pressure versus reciprocal temperature for acetic acid.

13.1.1.3 Propionic acid

Common Name: Propionic acid

Synonym: methylacetic acid, propanoic acid

Chemical Name: propanoic acid, propionic acid

CAS Registry No: 79-09-4

Molecular Formula: $C_3H_6O_2$, CH_3CH_2COOH

Molecular Weight: 74.079

Melting Point ($^{\circ}C$):

−20.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

141.15 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.99336, 0.98797 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach & Martin 1949)

0.9930 (Weast 1982–83)

Molar Volume (cm^3/mol):

74.6 ($20^{\circ}C$, calculated-density)

90.6 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

−6.80 (pK value, Perrin 1972)

4.874 (Dean 1985; Riddick et al. 1986)

4.870 (Sangster 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.66 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Dean 1985)

miscible (Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

550* (interpolated-regression of tabulated data, temp range 4.6 – $141.4^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.92234 - 1869.4/(230 + t/^{\circ}C)$, (Antoine eq., Dreisbach & Martin 1949)

7605* ($72.39^{\circ}C$, ebulliometry, measured range 72.39 – $140.80^{\circ}C$, Dreisbach & Shrader 1949)

446 (calculated by formula, Dreisbach 1961)

$\log(P/mmHg) = 7.35027 - 1497.775/(194.12 + t/^{\circ}C)$, temp range 60 – $185^{\circ}C$ (Antoine eq., Dreisbach 1961)

$\log(P/mmHg) = [-0.2185 \times 12454.4/(T/K)] + 9.647835$; temp range 4.6 – $238^{\circ}C$ (Antoine eq., Weast 1972–73)

435* (comparative ebulliometry, fitted to Antoine eq., Ambrose et al. 1981)

$\log(P/kPa) = 6.64344 - 1594.723/[(T/K) - 70.545]$; temp range 328 – $438\ K$ (Antoine eq., ebulliometry, Ambrose et al. 1981)

500, 442 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.84202 - 1736.007/(218.032 + t/^{\circ}C)$, temp range 72.39 – $128.34^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 6.67457 - 1615.227/(204.788 + t/^{\circ}C)$, temp range 55.11 – $164.9^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

257 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 6.403 - 950.2/(130.3 + t/^{\circ}C)$, temp range 56 – $139.5^{\circ}C$ (Antoine eq., Dean 1985, 1992)

451 (Riddick et al. 1986)

$\log(P/kPa) = 6.64334 - 1594.273/(202.605 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

452 (comparative ebulliometry, Ambrose & Ghiassee 1987)

$\ln (P/\text{kPa}) = 15.29686 - 3670.949/[(T/\text{K}) - 70.545]$, (Antoine eq., Ambrose & Ghiassaei 1987)

$\log (P_L/\text{kPa}) = 6.60267 - 1577.96/(-79.844 + T/\text{K})$, temp range 343–419 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 9.24101 - 12835.99/(-23.07 + T/\text{K})$, temp range 414–511 K (Antoine eq.-II, Stephenson & Malanowski 1987)

453, 8758 (measured, calculated-solvatochromic parameters, Banerjee et al. 1990)

$\log (P/\text{mmHg}) = 20.2835 - 3.1165 \times 10^3/(T/\text{K}) - 3.6015 \cdot \log (T/\text{K}) - 1.3892 \times 10^{-3} \cdot (T/\text{K}) + 7.1801 \times 10^{-7} \cdot (T/\text{K})^2$; temp range 252–604 K (vapor pressure eq., Yaws 1994)

14560* (88.37°C, VLE still-manometry, measured range 88.37–140.59°C, Clifford et al. 2004)

$\ln (P/\text{kPa}) = 18.105654 - 5640.3443/[(t/^\circ\text{C}) + 277.46143]$; temp range 88.37–140.59°C (Antoine eq., VLE still-manometry, Clifford et al. 2004)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

0.0445 (partial pressure, Butler & Ramchandani 1935)

0.0450 (exptl., Hine & Mookerjee 1975)

0.0420, 0.0430 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

0.0298 (calculated-MCI χ , Nirmalakhandan & Speece 1988)

0.0163, 0.00151, 0.0289 (23.1°C, bubble column technique, concn: 1, 10, 10^5 ppm. Servant et al. 1991)

0.0180 (equilibrium partial pressure, Khan & Brimblecombe 1992)

0.0431 (calculated-bond contribution, Brimblecombe et al. 1992)

0.0177 (equilibrium partial pressure, pH 5.4, Khan et al. 1995)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

0.25 (shake flask-titration, Collander 1951)

0.23, 0.24 (calculated- π const., calculated-fragment const., Rekker 1977)

0.33, 0.25 (Hansch & Leo 1979)

0.27 (shake flask-titration, Umland 1983)

0.33 (recommended, Sangster 1989; 1994)

0.33 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (1.6 \pm 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-resonance fluorescence, Zetzsch & Stuhl 1982; quoted, Atkinson 1985)

$k = 2.0 \times 10^{-3} \text{ M}^{-1} \text{ s}^{-1}$ for reaction with ozone at pH 8 in water, $k \leq 4.0 \times 10^{-4} \text{ M}^{-1} \text{ s}^{-1}$ for protonated species, and $k = (1 \pm 0.5) \times 10^{-3} \text{ M}^{-1} \text{ s}^{-1}$ for non-protonated species for the reaction with ozone in water at pH 2–5 and 20–23°C (Hoigné & Bader 1983b)

$k_{OH}^* = (1.22 \pm 0.12) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 298–440 K (flash photolysis-RF, Dagaut et al. 1988)

$k_{OH} = 1.22 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ in air and $k(\text{soln}) = 1.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with OH radical in aqueous solution (Wallington et al. 1988)

$k_{OH} = (1.22 - 1.60) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1989)

$k_{OH}(\text{calc}) = 1.35 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

FIGURE 13.1.1.3.1 Logarithm of vapor pressure versus reciprocal temperature for propionic acid.

13.1.1.4 Butyric acid

Common Name: Butyric acid

Synonym: butanoic acid, *n*-butyric acid, ethylacetic acid

Chemical Name: *n*-butyric acid, butyric acid

CAS Registry No: 107-92-6

Molecular Formula: $C_4H_8O_2$, $CH_3CH_2CH_2COOH$

Molecular Weight: 88.106

Melting Point ($^{\circ}C$):

−5.1 (Lide 2003)

Boiling Point ($^{\circ}C$):

163.75 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.95767, 0.95273 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach & Martin 1949)

0.9582 (Dean 1985; Riddick et al. 1986)

Molar Volume (cm^3/mol):

92.0 ($20^{\circ}C$, calculated-density)

112.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.817 (Dean 1985)

4.822 (Riddick et al. 1986)

4.820 (Sangster 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.6 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Dean 1985)

miscible (Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($25.5^{\circ}C$, temp range 25.5 – $163.5^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 8.19524 - 2089.9/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

4716* ($90.92^{\circ}C$, ebulliometry, measured range 90.92 – $163.25^{\circ}C$, Dreisbach & Shrader 1949)

95.77 (calculated by formula, Dreisbach 1961)

$\log(P/mmHg) = 7.38423 - 1542.6/(179.0 + t/^{\circ}C)$, temp range 82 – $210^{\circ}C$, (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = [-0.2185 \times 11881.2/(T/K)] + 8.773450$; temp range 25.5 – $352^{\circ}C$ (Antoine eq., Weast 1972–73)

83.95* (comparative ebulliometry, fitted to Antoine eq., measured range 340 – $452 K$, Ambrose et al. 1981)

$\log(P/kPa) = 6.55643 - 1563.444/[(T/K) - 93.307]$; temp range 339.7 – $452 K$ (Antoine eq., ebulliometry, Ambrose et al. 1981)

104, 92 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.8682 - 1766.906/(200.097 + t/^{\circ}C)$, temp range 90.2 – $163.25^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 6.67596 - 1642.683/(188.013 + t/^{\circ}C)$; temp range 76.53 – $178.9^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

104.3 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 7.7399 - 1764.7/(199.9 + t/^{\circ}C)$; temp range 90 – $163^{\circ}C$ (Antoine eq., Dean 1985, 1992)

102.0 (selected, Riddick et al. 1986)

$\log(P/kPa) = 6.55643 - 1563.444/(179.843 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

- 101 (comparative ebulliometry, Ambrose & Ghassee 1987)
 $\ln(P/\text{kPa}) = 15.09674 - 3599.963/[(T/\text{K}) - 93.307]$, (Antoine eq. from previous comparative ebulliometry measurements, Ambrose & Ghassee 1987)
 $\log(P_L/\text{kPa}) = 6.50913 - 1542.6/(-94.15 + T/\text{K})$; temp range 355–453 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 7.3554 - 2180.05/(-29.337 + T/\text{K})$; temp range 437–592 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 11.53324 - 5291.631/(128.778 + T/\text{K})$; temp range 301–358 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log(P/\text{mmHg}) = 8.0847 - 3.3219 \times 10^3/(T/\text{K}) + 2.4312 \cdot \log(T/\text{K}) - 1.1734 \times 10^{-2} \cdot (T/\text{K}) + 5.7992 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 268–628 K (vapor pressure eq., Yaws 1994)
 14560* (110.4°C, VLE still-manometry, measured range 110.4–162.9°C, Clifford et al. 2004)
 $\ln(P/\text{kPa}) = 14.511627 - 3164.4707/[(t/^\circ\text{C}) + 156.56122]$; temp range 110.4–162.9°C (Antoine eq., VLE still-manometry, Clifford et al. 2004)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

- 0.0542 (partial pressure, Butler & Ramchandani 1935)
 0.0542; 0.0590; 0.0650 (exptl.; calculated-group contribution; calculated-bond contribution, Hine & Mookerjee 1975)

13.1.1.5 Isobutyric acid

Common Name: Isobutyric acid

Synonym: isobutanoic acid, *i*-butyric acid, 1-butyric acid, dimethylacetic acid, 2-methylpropionic acid, isopropylformic acid

Chemical Name: *i*-butyric acid, isobutyric acid

CAS Registry No: 79-31-2

Molecular Formula: $C_4H_8O_2$, $(CH_3)_2CHCOOH$

Molecular Weight: 88.106

Melting Point ($^{\circ}C$):

−46.0 (Dean 1985; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

154.45 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9490 (Verschuereen 1983)

0.9682 (Riddick et al. 1986)

Molar Volume (cm^3/mol):

92.7 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

112.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.860 (Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.02 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

228000 ($20^{\circ}C$, synthetic method, Jones 1929)

200000 ($20^{\circ}C$, quoted, Verschuereen 1983)

170000 (Dean 1985)

228000 ($20^{\circ}C$, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

273.8* (interpolated-regression of tabulated data, temp range 14.7 – $154.5^{\circ}C$, Stull 1947)

185 (calculated by formula, Dreisbach 1961)

$\log(P/mmHg) = 7.40246 - 1529.2/(185.0 + t/^{\circ}C)$, temp range 73 – $190^{\circ}C$, (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = [-0.2185 \times 11182.8/(T/K)] + 8.55228$; temp range 14.7 – $336^{\circ}C$ (Antoine eq., Weast 1972–73)

185.0 (Riddick et al. 1986)

184* (comparative ebulliometry, measured range 344.3 – 445.6 K, Ambrose & Ghassee 1987)

$\ln(P/kPa) = 15.31143 - 3695.332/[(T/K) - 82.0]$; temp range 344.3 – 447 K (Antoine eq. from comparative ebulliometry measurements, Ambrose & Ghassee 1987)

257.2 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.20794 - 2023.52/(-38.649 + T/K)$; temp range 288 – 428 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.11635 - 2006.61/(-35.297 + T/K)$, temp range 428 – 562 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P/mmHg) = 11.3037 - 3.1625 \times 10^3/(T/K) + 0.7263 \cdot \log(T/K) - 8.9331 \times 10^{-3} \cdot (T/K) + 4.8215 \times 10^{-6} \cdot (T/K)^2$; temp range 227 – 609 K (vapor pressure eq., Yaws 1994)

14550* ($102.6^{\circ}C$, VLE still-manometer, measured range 102.6 – $153.01^{\circ}C$, Clifford et al. 2004)

$\ln (P/\text{kPa}) = 15.176238 - 3527.8614/[(t/^{\circ}\text{C}) + 180.5140]$; temp range 102–153.01°C (Antoine eq., VLE still-manometry, Clifford et al. 2004)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C or as indicated):

0.0178, 0.0289, 0.0633 (23.7°C, bubble column technique, concn: 1, 10, 10⁵ ppm. Servant et al. 1991)

0.0897 (equilibrium partial pressure, Khan & Brimblecombe 1992)

0.0899 (equilibrium partial pressure, pH 5.4, Khan et al. 1995)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.50, 1.13 (calculated, Verschueren 1983)

0.94 (recommended, Sangster 1993)

1.10 (at pH 3.5, quoted, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}}^* = (2.0 \pm 0.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 298–440 K (flash photolysis-RF, Dagaut et al. 1988; Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 1.36 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

FIGURE 13.1.1.5.1 Logarithm of vapor pressure versus reciprocal temperature for isobutyric acid.

13.1.1.6 *n*-Valeric acid

Common Name: *n*-Valeric acid

Synonym: pentanoic acid, valeric acid

Chemical Name: *n*-valeric acid, valeric acid

CAS Registry No: 109-52-4

Molecular Formula: $C_5H_{10}O_2$, $CH_3CH_2CH_2CH_2COOH$

Molecular Weight: 102.132

Melting Point ($^{\circ}C$):

−33.6 (Lide 2003)

Boiling Point ($^{\circ}C$):

186.1 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9391 (Weast 1982–83)

0.9390 (Dean 1985; Riddick et al. 1986)

Molar Volume (cm^3/mol):

108.4 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

135.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.820 ($18^{\circ}C$, Weast 1982–83)

4.860 (Riddick et al. 1986)

4.830 (Sangster 1989, 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

14.17 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, $F: 1.0$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

26000 ($20^{\circ}C$, quoted, Amidon et al. 1975)

24000 (Verschuereen 1983; Dean 1985)

24000 ($20^{\circ}C$, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

39.6* (extrapolated-regression of tabulated data, temp range 42.2 – $184.4^{\circ}C$, Stull 1947)

18.75 (calculated by formula, Dreisbach 1961)

$\log (P/mmHg) = 7.57366 - 1694.37/(175.0 + t/^{\circ}C)$, temp range 102 – $250^{\circ}C$, (Antoine eq. for liquid state, Dreisbach 1961)

$\log (P/mmHg) = [-0.2185 \times 13370.3/(T/K)] + 9.271178$; temp range 42.2 – $184.4^{\circ}C$ (Antoine eq., Weast 1972–73)

20.0 ($20^{\circ}C$, Verschuereen 1983)

4.33, 6.37 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 4.58366 - 609.613/(62.754 + t/^{\circ}C)$; temp range 72.4 – $173.7^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/kPa) = 5.0835 - 878.669/(95.711 + t/^{\circ}C)$; temp range 81.1 – $116.8^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/mmHg) = 5.412 - 591/(60 + t/^{\circ}C)$; temp range 72 – $174^{\circ}C$ (Antoine eq., Dean 1985, 1992)

19.0 (Riddick et al. 1986)

$\log (P/kPa) = 6.7818 - 1777.2/(186.6 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

21.0* (comparative ebulliometry, measured range 372.5 – $465.3\ K$, Ambrose & Ghassee 1987)

$\ln (P/kPa) = 15.25555 - 3811.202/[(T/K) - 101.0]$, temp range 372.5 – $456.3\ K$ (Antoine eq. from comparative ebulliometry measurements, Ambrose & Ghassee 1987)

16.9 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.69856 - 1694.37/(-98.15 + T/\text{K})$, temp range 375–523 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 15.3454 - 3.9024 \times 10^3/(T/\text{K}) - 0.024353 \cdot \log (T/\text{K}) - 1.1099 \times 10^{-2} \cdot (T/\text{K}) + 5.6315 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 239–651 K (vapor pressure eq., Yaws 1994)

14560 (130°C, VLE still-manometer, measured range 130–178.77°C, Clifford et al. 2004)

$\ln (P/\text{kPa}) = 36.410366 - 30029.229/(t/^\circ\text{C}) + 760.44819$; temp range 130–178.77°C (Antoine eq., VLE still-manometry, Clifford et al. 2004)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

0.0478 (equilibrium partial pressure, pH 1.6–1.9, Khan & Brimblecombe 1992)

$\ln [K_H' / (\text{mol kg}^{-1} \text{ atm}^{-1})] = -15.37 + 6879/(T/\text{K})$; temp range 278.15–308.15 K. (equilibrium partial pressure, Khan & Brimblecombe 1992)

0.0618, 0.0989 (calculated-P/C, calculated-bond contribution, Brimblecombe et al. 1992)

0.0448* (equilibrium partial pressure, pH 5.4, measured range 5–35°C, Khan et al. 1995)

$\ln [K_H' / (\text{mol kg}^{-1} \text{ atm}^{-1})] = -14.3371 + 6582.96/(T/\text{K})$; temp range 5–35°C (equilibrium partial pressure measurements, Khan et al. 1995)

0.0310 (20°C, selected from literature, experimentally measured data, Staudinger & Roberts 1996)

0.030 (20°C, selected from literature, experimentally measured data, Staudinger & Roberts 2001)

$\log K_{AW} = 4.861 - 2865/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.42 (Scherrer & Howard 1979)

0.99, 1.69 (calculated, Verschueren 1983)

1.39 (recommended, Sangster 1993)

1.39 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

13.1.1.7 Hexanoic acid (Caproic acid)

Common Name: Hexanoic acid

Synonym: butylacetic acid, caproic acid, *n*-hexanoic acid

Chemical Name: butylacetic acid, hexanoic acid, *n*-hexanoic acid

CAS Registry No: 142-62-1

Molecular Formula: $C_6H_{12}O_2$, $CH_3(CH_2)_4COOH$

Molecular Weight: 116.158

Melting Point ($^{\circ}C$):

−3 (Lide 2003)

Boiling Point ($^{\circ}C$):

205.2 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

125.0 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

157.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.850 (Dean 1985; Bintein & Devillers 1994)

4.879 (Riddick et al. 1986)

4.870 (Sangster 1989, 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

15.4 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

9887 (Valvani et al. 1981)

11000 (Verschuereen 1983)

10816 (Windholz 1983)

6391 (calculated-activity coefficient γ from UNIFAC, Banerjee 1985)

9580 ($20^{\circ}C$, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($71.4^{\circ}C$, summary of literature data, temp range 71.4 – $202^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 16189.4/(T/K)] + 10.431464$; temp range 71.4 – $202^{\circ}C$ (Antoine eq., Weast 1972–73)

4.40 (comparative ebulliometry, fitted to Antoine eq., Ambrose et al. 1981)

$\log(P/kPa) = 6.76323 - 1789.425/(T/K) - 101.930$; temp range: 386.3 – $441.8 K$ (Antoine eq., ebulliometry, Ambrose et al. 1981)

26.7 ($20^{\circ}C$, Verschuereen 1983)

9.92, 1.65 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.74777 - 1779.677/(178.361 + t/^{\circ}C)$, temp range 113.1 – $168.6^{\circ}C$ (Antoine eq. from reported exptl. data of Ambrose et al. 1981, Boublik et al. 1984)

$\log(P/kPa) = 6.06182 - 1347.897/(127.391 + t/^{\circ}C)$, temp range 98.1 – $179.1^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/mmHg) = 6.9249 - 1340.8/(126.6 + t/^{\circ}C)$, temp range 98 – $179^{\circ}C$ (Antoine eq., Dean 1985, 1992)

5.00 (Riddick et al. 1986)

$\log(P/kPa) = 6.76323 - 1789.425/(171.22 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

6.0 (calculated from Wagner eq. derived from experimental data, Ambrose & Ghassee 1987)

$\ln(P/kPa) = 15.30352 - 3957.396/[(T/K) - 108]$ (Antoine eq., Ambrose & Ghassee 1987)

$\log(P_L/kPa) = 7.08241 - 2009.93/(-82.69 + T/K)$; temp range 335 – $487 K$ (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 55.7058 - 5.6602 \times 10^3/(T/K) - 15.458 \cdot \log (T/K) + 1.0823 \times 10^{-9} \cdot (T/K) + 1.8718 \times 10^{-13} \cdot (T/K)^2$;
temp range 270–667 K (vapor pressure eq., Yaws 1994)

9520 (140.25°C, VLE still-manometer, measured range 140.25–178.28°C, Clifford et al. 2004)

$\ln (P/\text{kPa}) = 13.46595 - 2642.198/[t/^\circ\text{C} + 95.20133]$; temp range 140.25–178.28°C (Antoine eq., VLE still-manometry, Clifford et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.0768 (equilibrium partial pressure, pH 1.6–1.9, Khan & Brimblecombe 1992)

$\ln [K_H/(\text{mol kg}^{-1} \text{ atm}^{-1})] = -12.69 + 5988/(T/K)$; temp range 278.15–303.15 K (equilibrium partial pressure, Khan & Brimblecombe 1992)

0.0873, 0.149 (calculated-P/C, calculated-bond contribution, Brimblecombe et al. 1992)

0.0720* (equilibrium partial pressure, pH 5.4, measured range 5–35°C, Khan et al. 1995)

$\ln [K_H'/(\text{mol kg}^{-1} \text{ atm}^{-1})] = -13.9424 + 6303.73/(T/K)$; temp range 5–35°C (equilibrium partial pressure measurements, Khan et al. 1995)

0.0583 (20°C, selected from literature, experimentally measured data, Staudinger & Roberts 1996)

0.0556 (20°C, selected from literature, experimentally measured data, Staudinger & Roberts 2001)

$\log K_{AW} = 3.955 - 2520/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.88 (Scherrer & Howard 1979)

1.87 (HPLC-RT correlation, D'Amboise & Hanai 1982)

1.92 (shake flask-titration, Umland 1983)

2.09 (shake flask-fluorescence, Nishimura et al. 1985)

1.32 (calculated-activity coefficient γ from UNIFAC, Banerjee & Howard 1988)

2.03 ± 0.01 (potentiometric titration, Hersey et al. 1989)

1.92 (recommended, Sangster 1989, 1993)

1.92 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

1.38; 1.42; 1.57 (Alfisol soil; Podzol soil; sediment, von Oepen et al. 1991)

1.46; 0.88 (soil, quoted exptl.; calculated-MCI χ and fragment contribution, Meylan et al. 1992)

1.46 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

FIGURE 13.1.1.7.2 Logarithm of Henry's law constant versus reciprocal temperature for hexanoic acid.

13.1.1.8 Stearic acid (Octadecanoic acid)

Common Name: Stearic acid

Synonym: octadecanoic acid

Chemical Name: stearic acid, octadecanoic acid, *n*-octadecylic acid

CAS Registry No: 57-11-4

Molecular Formula: $C_{18}H_{36}O_2$, $CH_3(CH_2)_{16}COOH$

Molecular Weight: 284.478

Melting Point ($^{\circ}C$):

69.3 (Lide 2003)

Boiling Point ($^{\circ}C$):

350 (dec., Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9408 (Weast 1982–83)

Molar Volume (cm^3/mol):

335.9 ($70^{\circ}C$, Stephenson & Malanowski 1987)

423.6 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.50 (estimated, Sangster 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

39.57; 43.5 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.368 (mp at $69.3^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

340 (Verschuereen 1983)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

133.3 ($173.7^{\circ}C$, summary of literature data, temp range: 173.7 – $370^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 19306.6/(T/K)] + 9.457471$; temp range: 173.7 – $370^{\circ}C$, (Antoine eq., Weast 1972–73)

1.69×10^{-12} (extrapolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.17126 - 2157.5/(-153.78 + T/K)$; temp range 349 – $415 K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.85188 - 1717.93/(-201.829 + T/K)$; temp range 447 – $649 K$ (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P/mmHg) = -40.3638 - 4.7724 \times 10^3/(T/K) + 24.502 \cdot \log(T/K) - 3.7665 \times 10^{-2} \cdot (T/K) + 1.4595 \times 10^{-5} \cdot (T/K)^2$; temp range 343 – $799 K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

8.23 (HPLC-RT correlation, D'Amboise & Hanai 1982)

8.23 (recommended, Sangster 1989, 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

13.1.1.9 Oleic acid

Common Name: Oleic acid

Synonym: *cis*-9-octadecenoic acid, (Z)-9-octadecenoic acid

Chemical Name: oleic acid

CAS Registry No: 112-80-1

Molecular Formula: $C_{18}H_{34}O_2$, $CH_3(CH_2)_7CH=CH(CH_2)_6CH_2COOH$

Molecular Weight: 282.462

Melting Point ($^{\circ}C$):

13.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

360 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8870 ($25^{\circ}C$, Riddick et al. 1986)

0.8935 (Lide 2003)

Molar Volume (cm^3/mol):

314.7 (Stephenson & Malanowski 1987)

416.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

5.02 (Riddick et al. 1986)

4.50 (Sangster 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

insoluble (McBain & Richards 1946; Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

133 ($178.5^{\circ}C$, summary of literature data, temp range 176.5 – $360^{\circ}C$, Stull 1947)

0.00144 (extrapolated-Antoine eq., Weast 1972–73)

$\log(P/mmHg) = [-0.2185 \times 20326.7/(T/K)] + 9.930301$; temp range 176.5 – $360^{\circ}C$ (Antoine eq., Weast 1972–73)

0.00113 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 8.22018 - 3711.59/(-36.125 + T/K)$; temp range 444 – 635 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 78.6973 - 8.8227 \times 10^3/(T/K) - 22.472 \cdot \log(T/K) + 4.8353 \times 10^{-11} \cdot (T/K) + 2.6578 \times 10^{-6} \cdot (T/K)^2$; temp range 287 – 633 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.64 (RP-HPLC- k' correlation, D'Amboise & Hanai 1982)

7.64 (recommended, Sangster 1989, 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

13.1.1.10 Acrylic acid (2-Propenoic acid)

Common Name: Acrylic acid

Synonym: acroleic acid, ethylenecarboxylic acid, 2-propenoic acid, propenoic acid

Chemical Name: acrylic acid, 2-propenoic acid, propenoic acid

CAS Registry No: 79-10-7

Molecular Formula: $C_3H_4O_2$, $CH_2=CHCOOH$

Molecular Weight: 72.063

Melting Point ($^{\circ}C$):

12.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

141 (Lide 1003)

Density (g/cm^3 at $20^{\circ}C$):

1.0511 (Weast 1982–83; Dean 1985; Riddick et al. 1986)

Molar Volume (cm^3/mol):

68.9 (calculated-density, Stephenson & Malanowski 1987)

83.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

–4.41 (Perrin 1972)

4.25 (pK_a , Weast 1982–83)

4.26 (pK_a , Dean 1985)

4.255 (pK_a , Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.13 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Dean 1985)

miscible (Riddick et al. 1986)

miscible (Yaws et al. 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

570.8 (interpolated-regression of tabulated data, temp range 3.5 – $141^{\circ}C$, Stull 1947)

506.5 (Hoy 1970)

570 (interpolated-Antoine eq., Weast 1972–73)

$\log(P/mmHg) = [-0.2185 \times 10955.1/(T/K)] + 8.659704$; temp range 3.5 – $141^{\circ}C$ (Antoine eq., Weast 1972–73)

426.6 ($20^{\circ}C$, Verschueren 1983)

$\log(P/mmHg) = 5.65204 - 648.629/(154.683 + t/^{\circ}C)$; temp range 20 – $70^{\circ}C$ (Antoine eq., Dean 1985, 1992)

533.0 (Howard et al. 1986)

1030 ($20^{\circ}C$, Riddick et al. 1986)

581.7 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.93296 - 1827.9/(-43.15 + T/K)$; temp range 341 – $414\ K$ (Antoine eq., Stephenson & Malanowski 1987)

533, 12530 (measured, calculated-solvatochromic parameters, Banerjee et al. 1990)

$\log(P/mmHg) = 23.0607 - 3.1347 \times 10^3/(T/K) - 4.8813 \cdot \log(T/K) + 4.369 \times 10^{-4} \cdot (T/K) - 4.9161 \times 10^{-13} \cdot (T/K)^2$; temp range 287 – $615\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$):

0.042 (computed-vapor liquid equilibrium VLE data, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 0.43 (Leo et al. 1971)
- 0.31, 0.43 (calculated, Verschueren 1983)
- 0.35 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: photooxidation $t_{1/2} t_{1/2} = 2.5\text{--}23.8$ h in air, based on an estimated rate constant for the vapor-phase reaction with hydroxyl radical and ozone in air (Atkinson & Carter 1984; Atkinson 1987; selected, Howard et al. 1991)

Hydrolysis: no hydrolyzable groups (Howard et al. 1991).

Biodegradation: aqueous aerobic $t_{1/2} = 24\text{--}168$ h, based on unacclimated aqueous screening test data (Dore et al. 1975; Sasaki 1978; selected, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 672\text{--}4320$ h, based on unacclimated anaerobic reactor test data (Chou et al. 1979; selected, Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 1$ d, $t_{1/2}(\text{anaerobic}) = 28$ d in natural waters (Capel & Larson 1995)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 2.5\text{--}23.8$ h, based on an estimated rate constant for the vapor-phase reaction with hydroxyl radical and ozone in air (Atkinson & Carter 1984; Atkinson 1987; selected, Howard et al. 1991); atmospheric transformation lifetime was estimated to be < 1 d (Kelly et al. 1994).

Surface water: $t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 1$ d, $t_{1/2}(\text{anaerobic}) = 28$ d in natural waters (Capel & Larson 1995)

Groundwater: $t_{1/2} = 48\text{--}4320$ h, based on estimated unacclimated aqueous aerobic and anaerobic biodegradation half-lives (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

13.1.1.11 Chloroacetic acid

Common Name: Chloroacetic acid

Synonym:

Chemical Name: chloroacetic acid (α or β)

CAS Registry No: 79-11-8

Molecular Formula: $\text{C}_2\text{H}_3\text{ClO}_2$, ClCH_2COOH

Molecular Weight: 94.497

Melting Point ($^{\circ}\text{C}$):

61.2 (α , Stull 1947; Yalkowsky & Valvani 1980)

56.0 (β , Yalkowsky & Valvani 1980)

56–63 (Weast 1982–83; Dean 1985)

63 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

189.3 (Lide 2003)

Density (g/cm^3 at 20°C):

1.4043 (40°C , Weast 1982–83)

Molar Volume (cm^3/mol):

68.8 (63°C , Stephenson & Malanowski 1987)

89.3 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

2.85 (Weast 1982–83)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

56 (estimated, Yalkowsky & Valvani 1980)

36.73, 42.22 (observed for α , observed for β , Yalkowsky & Valvani 1980)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F : 0.424 (mp at 63°C)

Water Solubility (g/m^3 or mg/L at 25°C):

120835 (α , calculated- ΔS_{fus} and mp, calculated-mp, Yalkowsky & Valvani 1980)

107200 (β , calculated- ΔS_{fus} and mp, calculated-mp, Yalkowsky & Valvani 1980)

109000 (shake flask-titrimetric assay, Bowden et al. 1998)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

39.70* (extrapolated-regression of tabulated data, temp range 43.0 – 189.5°C , Stull 1947)

$\log (P/\text{mmHg}) = 8.28534 - 2263.7/(230 + t/^{\circ}\text{C})$ (Antoine eq., Dreisbach & Martin 1949)

6301* (112.8°C , ebulliometry, measured range 112.8 – 187.55°C , Dreisbach & Shrader 1949)

4141* (104.47°C , ebulliometry, measured range 104.47 – 190.27°C , McDonald et al. 1959)

$\log (P/\text{mmHg}) = 7.56597 - 1733.96/(180.996 + t/^{\circ}\text{C})$; temp range: 104 – 190°C (Antoine eq. from ebulliometry measurement, McDonald et al. 1959)

$\log (P/\text{mmHg}) = [-0.2185 \times 13134.5/(T/\text{K})] + 9.099371$; temp range 43 – 189°C (Antoine eq., Weast 1972–73)

18.52, 12.9 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.67559 - 1723.714/(180.01 + t/^{\circ}\text{C})$; temp range 104 – 190.27°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.29612 - 1468.443/(154.397 + t/^{\circ}\text{C})$; temp range 123.19 – 187.9°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

18.52 (extrapolated-Antoine eq., Dean 1985)

$\log (P/\text{mmHg}) = 7.55016 - 1723.365/(179.98 + t/^{\circ}\text{C})$; temp range 104 – 190°C (Antoine eq., Dean 1985, 1992)

8.51, 11.5 (extrapolated-Antoine eq.-I and II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.69087 - 1733.96/(-92.154 + T/K)$; temp range 336–463 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.67975 - 1727.293/(-97.742 + T/K)$; temp range 377–464 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 42.6726 - 4.597 \times 10^3/(T/K) - 11.348 \cdot \log (T/K) - 2.8515 \times 10^{-10} \cdot (T/K) + 1.7995 \times 10^{-6} \cdot (T/K)^2$; temp range 333–686 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C and reported temperature dependence equations):

0.000938 (partial pressure equilibrium, Bowden et al. 1998)

$\ln [(K_H'/(\text{mol kg}^{-1} \text{ atm}^{-1}))] = -21.087 + 9742.6/(T/K)$, temp range $5\text{--}35^\circ\text{C}$ (partial pressure equilibrium measurements, Bowden et al. 1998)

0.000536 (20°C , selected from literature experimentally measured data, Staudinger & Roberts 2001)

$\log K_{AW} = 7.343 - 4104/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.22 (shake flask, Hansch & Leo 1987; recommended, Hansch et al. 1995)

0.22 (recommended, Sangster 1993)

0.22 (calculated-fragment const. with correction factors in multiCASE program, Dambrosky et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: aqueous photolysis $t_{1/2} = 1900\text{--}19000$ h, based on experimental photolysis data utilizing an artificial light source (Draper & Crosby 1983; quoted, Howard et al. 1991);

atmospheric photolysis $t_{1/2} = 1900\text{--}19000$ h, based on estimated aqueous photolysis half-life (Howard et al. 1991);

photocatalyzed mineralization by the presence of TiO_2 with the rate of 5.5 ppm/min per gram of catalyst (Ollis 1985).

Hydrolysis: first-order hydrolysis $t_{1/2} = 23000$ h, based on losses in dark control tests during photolysis experiments (Draper & Crosby 1983; quoted, Howard et al. 1991).

Oxidation: photooxidation $t_{1/2} = 230\text{--}2300$ h, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Biodegradation: aqueous aerobic $t_{1/2} = 24\text{--}168$ h, based on river die-away tests using radio-labeled material (Boethling & Alexander 1979; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 96\text{--}672$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 230\text{--}2300$ h, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be 5 d (Kelly et al. 1994).

Surface water: aqueous photolysis $t_{1/2} = 1900\text{--}19000$ h, based on experimental photolysis data utilizing an artificial light source (Draper & Crosby 1983; quoted, Howard et al. 1991); $t_{1/2} = 24\text{--}168$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 48\text{--}336$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

13.1.1.12 Dichloroacetic acid

Common Name: Dichloroacetic acid

Synonym: dichloroethanoic acid

Chemical Name: dichloroacetic acid

CAS Registry No: 79-43-6

Molecular Formula: $C_2H_2Cl_2O_2$, $Cl_2CHCOOH$

Molecular Weight: 128.942

Melting Point ($^{\circ}C$):

13.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

194.0 (Weast 1982–83; Verschueren 1983; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.5634 (Weast 1982–83)

1.5630 (Verschueren 1983; Dean 1985)

Molar Volume (cm^3/mol):

82.50 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

110.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

1.26 (Dean 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Dean 1985)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

37.94* (extrapolated-regression of tabulated data, temp range 44 – $194.4^{\circ}C$, Stull 1947)

133.3 ($44^{\circ}C$, Stull 1947; quoted, Verschueren 1983)

$\log(P/mmHg) = [-0.2185 \times 12952.9/(T/K)] + 8.946605$; temp range 44 – $194.4^{\circ}C$ (Antoine eq., Weast 1972–73)

34.3 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.47122 - 2385.6/(-31.197 + T/K)$, temp range 317 – $468\ K$ (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = -7.2806 - 3.3706 \times 10^3/(T/K) + 9.3771 \cdot \log(T/K) - 2.0832 \times 10^{-2} \cdot (T/K) + 9.5091 \times 10^{-6} \cdot (T/K)^2$; temp range 287 – $686\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.00085 (partial pressure equilibrium, Bowden et al. 1998)

$\ln[(K_H'/(mol\ kg^{-1}\ atm^{-1}))] = -15.1776 + 8010.6/(T/K)$; temp range 5 – $35^{\circ}C$ (partial pressure equilibrium measurements, Bowden et al. 1998)

0.000536 ($20^{\circ}C$, selected from literature, experimentally measured data, Staudinger & Roberts 2001)

$\log K_{AW} = 4.776 - 3352/(T/K)$, (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.92 (shake flask, Log P Database, Hansch & Leo 1987)

0.92 (recommended, Sangster 1993)

0.92 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photocatalyzed mineralization by the presence of TiO_2 with the rate of 8.5 ppm/min per gram catalyst (Ollis 1985).

Half-Lives in the Environment:

13.1.1.13 Trichloroacetic acid

Common Name: Trichloroacetic acid

Synonym: TCA

Chemical Name: trichloroacetic acid (α or β)

CAS Registry No: 76-03-9

Molecular Formula: Cl_3CCOOH

Molecular Weight: 163.39

Melting Point ($^{\circ}\text{C}$):

59.2 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

196.5 (Lide 2003)

Density (g/cm^3 at 20°C):

1.620 (25°C , Weast 1982–83)

Molar Volume (cm^3/mol):

100.3 (61°C , Stephenson & Malanowski 1987)

131.1 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

0.70 (Weast 1982–83)

0.52 (Dean 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

17.78, 56 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F: 0.462 (mp at 59.2°C)

Water Solubility (g/m^3 or mg/L at 25°C):

114550 (calculated- ΔS_{fus} and mp, Yalkowsky & Valvani 1980)

191860 (calculated-mp, Yalkowsky & Valvani 1980)

13000 (Verschuereen 1983)

1200000 (120 in 100 parts solvent, Dean 1985)

38300 (calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

21.88* (extrapolated-regression of tabulated data, temp range 51 – 195.6°C , Stull 1947)

4620* (112.62°C , ebulliometry, measured range 112.62 – 197.93°C , McDonald et al. 1959)

$\log(P/\text{mmHg}) = 7.31057 - 1618.97/(167.882 + t/^{\circ}\text{C})$; temp range 112.6 – 197.94°C (Antoine eq. from ebulliometry measurement, McDonald et al. 1959)

$\log(P/\text{mmHg}) = [-0.2185 \times 13817.0/(T/\text{K})] + 9.341430$; temp range 51 – 195.6°C (Antoine eq., Weast 1972–73)

10.63 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/\text{kPa}) = 6.4026 - 1597.434/(165.711 + t/^{\circ}\text{C})$; temp range 112.6 – 197.93°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

66.14 (extrapolated-Antoine eq., Dean 1985)

$\log(P/\text{mmHg}) = 7.2730 - 1594.3/(165.4 + t/^{\circ}\text{C})$; temp range 112 – 198°C (Antoine eq., Dean 1985, 1992)

133.3 (Howard et al. 1986; quoted, Banerjee et al. 1990)

11.01 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.43547 - 1618.97/(-105.268 + T/\text{K})$; temp range 326 – 473 K (Antoine eq., Stephenson & Malanowski 1987)

133.3, 491 (measured, calculated-solvatochromic parameters, Banerjee et al. 1990)

$\log(P/\text{mmHg}) = 63.4449 - 3.6769 \times 10^3/(T/\text{K}) - 21.13 \cdot \log(T/\text{K}) + 1.0777 \times 10^{-2} \cdot (T/\text{K}) + 4.8481 \times 10^{-12} \cdot (T/\text{K})^2$; temp range 258 – 491 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

0.000137 (partial pressure equilibrium, Bowden et al. 1998)

$\ln [(K_H'/(\text{mol kg}^{-1} \text{ atm}^{-1}))] = -17.836 + 8660.09/(T/K)$; temp range $5\text{--}35^\circ\text{C}$ (partial pressure equilibrium measurements, Bowden et al. 1998)

0.000834 (20°C , selected from literature, experimentally measured data, Staudinger & Roberts 2001)

$\log K_{AW} = 5.931 - 3634/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.33 (shake flask, Log P Database, Hansch & Leo 1987)

1.33 (recommended, Sangster 1993)

1.33 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: no photocatalyzed mineralization by the presence of TiO_2 as compared to both dichloroacetic acid and trichloroacetic acid (Ollis 1985).

Half-Lives in the Environment:

- 1.95 (HPLC- k' correlation; Miyake & Terada 1982)
- 1.87 (microelectrometric titration, Clarke 1984)
- 2.18 \pm 0.03; 2.03 (exptl.-ALPM, selected best lit. value, Garst & Wilson 1984)
- 1.44, 1.87 (HPLC- k' correlation, Haky & Young 1984)
- 1.88 (shake flask-UV at pH 0.5, Nishimura et al. 1985)
- 1.97 (microelectrometric titration, Clarke & Cahoon 1987)
- 1.94 (shake flask-radiochemical method, at pH 0.5, Laznicek et al. 1987)
- 1.93 (HPLC- k' correlation, Miyake et al. 1987)
- 1.88 (CPC, Berthod et al. 1988)
- 1.85 \pm 0.04 ("Filter Chamber"-UV, Hersey et al. 1989)
- 1.87 (recommended, Sangster 1989, 1993)
- 1.88 (back flashing-CPC centrifugal partition chromatography, Menges et al. 1990)
- 1.87 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:Bioconcentration Factor, $\log BCF$:

- 1.32, 2.00, 2.14 (fish, algae, mosquito, Lu & Metcalf 1975)
- 3.26, 3.45 (daphnia, snail, Lu & Metcalf 1975)
- 0.48 (alga *Chlorella fusca*, wet wt. basis, Geyer et al. 1984)
- 1.43 (alga *Chlorella fusca*, calculated- K_{ow} , Geyer et al. 1984)
- < 1.0 (golden ide, Freitag et al. 1985)
- < 1.0 (algae, Freitag et al. 1985)
- 3.11 (activated sludge, Freitag et al. 1985)
- 1.15 (trout muscle, calculated- K_{ow} , Branson 1978)

Sorption Partition Coefficient, $\log K_{OC}$:

- 1.26; 1.86; 0.602 (Alfisol soil; Podzol soil; sediment, von Oepen et al. 1991)
- 1.50 (soil, quoted exptl., Meylan et al. 1992)
- 1.16 (soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
- 1.50 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: rate of evaporation $k = 1.89 \times 10^{-8} \text{ mol cm}^{-2} \text{ h}^{-1}$ at 20°C determined by evaporation method (Gückel et al. 1982).

Photolysis:

Oxidation: photooxidation $t_{1/2} = 2.0 \text{ d}$, based on estimated vapor-phase reaction with hydroxyl radical in air (Howard 1989).

Hydrolysis: $k = 4.3 \times 10^9 \text{ L mol}^{-1} \text{ s}^{-1}$ for reactions of hydroxyl radical in aqueous solution (Buxton et al. 1986)

$k = 1.15 \times 10^{13} \text{ M}^{-1} \text{ h}^{-1}$ (Mabury & Crosby 1996);

$k(\text{exptl}) = 1.2 \times 10^{13} \text{ M}^{-1} \text{ h}^{-1}$ for reaction with hydroxy radical (Armbrust 2000)

Biodegradation: completely degraded by a soil microflora after 24 h (Alexander & Lustigman 1966; quoted, Verschueren 1983);

completely degraded for 16 mg/L concn. within one day by soil and by wastewater (Haller 1978);

$t_{1/2} \sim 0.2\text{--}3.6$ d if released into water, should readily biodegrade (Howard 1989);
average $k(\text{exptl}) = 0.11533 \text{ h}^{-1}$ compared to group method predicted $k = 0.0993 \text{ h}^{-1}$ (nonlinear) and $k = 0.0263 \text{ h}^{-1}$ (linear) (Tabak & Govind 1993).

Biotransformation: degradation $k = 6.84 \times 10^{-17} \text{ mol cell}^{-1} \text{ h}^{-1}$ in pure culture system (Banerjee et al. 1984).
Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} \sim 2.0$ d for reactions with photochemically produced hydroxyl radical (Howard 1989).
Surface water: if released into water, should readily biodegrade with an estimated $t_{1/2} = 0.2\text{--}3.6$ d (Howard 1989).
Groundwater:
Sediment:
Soil:
Biota:

13.1.2.2 2-Methyl benzoic acid (*o*-Toluic acid)

Common Name: *o*-Toluic acid

Synonym: 2-methyl benzoic acid

Chemical Name: *o*-toluic acid, 2-methyl benzoic acid

CAS Registry No: 118-90-1

Molecular Formula: $C_8H_8O_2$, $CH_3C_6H_4COOH$

Molecular Weight: 136.149

Melting Point ($^{\circ}C$):

103.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

259 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.062 (115 $^{\circ}C$, Weast 1982–83; Verschueren 1983)

Molar Volume (cm^3/mol):

157.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

3.91 (McDaniel & Brown 1958; quoted, Pearce & Simkins 1968)

3.91 (Weast 1982–83)

3.90 (Dean 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

20.17 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

53.56 (Tsonopoulos & Prausnitz 1971)

53.5, 56 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.170 (mp at $103.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

22300* (85.1 $^{\circ}C$, shake flask-residue volume, measured range 85.1–102.4 $^{\circ}C$, Sidgwick et al. 1915)

1185 (shake flask, Fühner 1924)

1162* (shake flask-weight titration, measured range 5–65 $^{\circ}C$, Strong et al. 1989)

1074* (shake flask-UV, Sugunan & Thomas 1993)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

$\log(P/mmHg) = -35.8816 - 3.2354 \times 10^3/(T/K) + 21.133 \cdot \log(T/K) - 3.0165 \times 10^{-2} \cdot (T/K) + 1.1587 \times 10^{-5} \cdot (T/K)^2$;
temp range 377–751 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.18 (shake flask-UV, Tomida et al. 1978)

2.81 (Scherrer & Howard 1979)

2.46 (shake flask at pH 1, Hansch & Leo 1987)

2.27 (shake flask-UV at pH 2, Da et al. 1992)

2.46 (recommended, Sangster 1993)

2.46 (recommended, pH 1, Hansch et al. 1995)

1.72 (RP-HPLC-RT correlation on short ODP column, pH 2, Donovan & Pescatore 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants or Half-Lives:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: decomposition by a soil microflora in 16 d (Alexander & Lustigman 1966; quoted, Verschueren 1983).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota:

Molar Volume (cm^3/mol):

129.2 ($112^{\circ}C$, Stephenson & Malanowski 1987)

157.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.270 (Weast 1982–83)

4.269 (Dean 1985)

4.220 (Sangster 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

15.73 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

10.96 (Tsonopoulos & Prausnitz 1971)

41.17, 56 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.147 (mp at $109.9^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

11600* ($80^{\circ}C$, shake flask-residue volume, measured range 80 – $110.5^{\circ}C$, Sidgwick et al. 1915)

982 (shake flask-residue volume method, Fühner 1924)

1700 (20 – $25^{\circ}C$, shake flask-GC, Urano et al. 1982)

872* (shake flask-weight titration, measured range 5 – $65^{\circ}C$, Strong et al. 1989)

1246* (shake flask-UV, Sugunan & Thomas 1993)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

$\log (P_L/kPa) = 8.1472 - 3280.8/(T/K)$, temp range 473 – $533 K$ (Antoine eq., liquid, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.37 (shake flask-UV, Fujita et al. 1964; quoted, Leo et al. 1971; Hansch & Leo 1979)

2.43 (HPLC- k' correlation, Miyake & Terada 1982)

2.41 (shake flask-AS, Miyake et al. 1987)

2.39 (centrifugal partition chromatography CPC, Terada et al. 1987)

2.44; 2.47 (shake flask at pH 1, HPLC-RT correlation, Wang et al. 1989)

2.38 (shake flask-UV at pH 2, Da et al. 1992)

- 2.37 (recommended, Sangster 1993)
 2.37 (recommended, Hansch et al. 1995)

13.1.2.4 4-Methyl benzoic acid (*p*-Toluic acid)

Common Name: *p*-Toluic acid

Synonym: 4-methyl benzoic acid

Chemical Name: *p*-toluic acid, 4-methyl benzoic acid

CAS Registry No: 99-94-5

Molecular Formula: $C_8H_8O_2$, $CH_3C_6H_4COOH$

Molecular Weight: 136.149

Melting Point ($^{\circ}C$):

179.6 (Lide 2003)

Boiling Point ($^{\circ}C$):

275.0 (sublimation, Weast 1982–83)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

157.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.37, 4.30 ± 0.09 (quoted, HPLC, Unger et al. 1978)

4.37, 4.41 ± 0.01 (quoted, HPLC, Unger et al. 1978)

4.36 (Weast 1982–83)

4.37, 4.26 (quoted, shake flask-TN, Clarke 1984)

4.362 (Dean 1985)

4.39 (Sangster 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

22.72 (Tsonopoulos & Prausnitz 1971)

23.81 (differential scanning calorimetry, Li et al. 2001)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

50.21 (Tsonopoulos & Prausnitz 1971)

50.21, 56 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.0304 (mp at $179.6^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

11600* (100, shake flask-residue volume, measured range 100 – $176.8^{\circ}C$, Sidgwick et al. 1915)

383 (selected, Tsonopoulos & Prausnitz 1971)

13.1.2.5 Phenylacetic acid

Common Name: Phenylacetic acid

Synonym: phenylethanoic acid, α -toluic acid, benzenecetic acid

Chemical Name: phenylacetic acid

CAS Registry No: 103-82-2

Molecular Formula: $C_8H_8O_2$, $C_6H_5CH_2COOH$

Molecular Weight: 136.149

Melting Point ($^{\circ}C$):

76.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

265.5 (Stull 1947; Weast 1982–83; Dean 1985; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.081 (Verschuereen 1983)

Molar Volume (cm^3/mol):

124.8 ($77^{\circ}C$, Stephenson & Malanowski 1987)

157.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.28 ($18^{\circ}C$, Weast 1982–83)

4.31 (Sangster 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.11 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

48.95 (Tsonopoulos & Prausnitz 1971)

41.42, 56 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.312 (mp at $76.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

17700* (thermostatic and synthetic methods, measured range 25 – $86.7^{\circ}C$, Morrison 1944)

16600 ($20^{\circ}C$, Hodgman 1952)

17790 (selected, Tsonopoulos & Prausnitz 1971)

16600 ($20^{\circ}C$, quoted, Verschuereen 1983)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.835 (extrapolated-regression of tabulated data, temp range 97 – $265^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 15568.7/(T/K)] + 9.206178$; temp range 97 – $265.5^{\circ}C$ (Antoine eq., Weast 1972–73)

0.827 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P/kPa) = 8.00148 - 3144.95/(-14.408 + T/K)$; temp range 370 – $539\ K$ (Antoine eq., Stephenson & Malanowski 1987)

13.1.2.7 2-Chlorobenzoic acid

Common Name: 2-Chlorobenzoic acid

Synonym: *o*-chlorobenzoic acid

Chemical Name: 2-chlorobenzoic acid, *o*-chlorobenzoic acid

CAS Registry No: 118-91-2

Molecular Formula: $C_7H_5ClO_2$, ClC_6H_4COOH

Molecular Weight: 156.567

Melting Point ($^{\circ}C$):

140.2 (Lide 2003)

Boiling Point ($^{\circ}C$):

sublimation (Verschuereen 1983; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.5440 (Weast 1982–83, Verschuereen 1983)

1.5440 ($25^{\circ}C$, Dean 1985)

Molar Volume (cm^3/mol):

101.4 ($20^{\circ}C$, calculated-density)

155.7 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

2.920 (McDaniel & Brown 1958; quoted, Pearce & Simkins 1968; Weast 1982–83)

2.877 (Dean 1985)

3.850 (Sangster 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

25.73 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

62.34 (Tsonopoulos & Prausnitz 1971)

62.26, 56 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.0741 (mp at $140.2^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2130 (Osol & Kilpatrick 1933)

2114 (selected, Tsonopoulos & Prausnitz 1971)

2100 (Verschuereen 1983)

1100 (Dean 1985)

Vapor Pressure (Pa at $25^{\circ}C$):

$\log (P/mmHg) = -42.9847 - 3.1867 \times 10^3/(T/K) + 23.694 \cdot \log (T/K) - 3.0284 \times 10^{-2} \cdot (T/K) + 1.0828 \times 10^{-5} \cdot (T/K)^2$;
temp range 415–792 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.98 (shake flask, unpublished result, Leo et al. 1971; Hansch & Leo 1979, 1987)

2.63; 2.56 (calculated-fragment const., calculated- π const. Rekker 1977)

2.66 (shake flask-UV, Tomida et al. 1978)

1.99 (centrifugal partition chromatography, Berthod et al. 1988)

2.02 (shake flask-UV at pH 2, Da et al. 1992)

1.99 (recommended, Sangster 1993)

2.05 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

FIGURE 13.1.2.10.2 Logarithm of vapor pressure versus reciprocal temperature for salicylic acid.

13.1.2.11 2,4-Dichlorophenoxyacetic acid (2,4-D) (See also [Chapter 17](#), Herbicides)

Common Name: 2,4-Dichlorophenoxyacetic acid

Synonym: 2,4-D

Chemical Name: 2,4-dichlorophenoxyacetic acid

CAS Registry No: 94-75-7

Molecular Formula: $C_8H_6Cl_2O_3$, $Cl_2C_6H_3OCH_2COOH$

Molecular Weight: 221.038

Melting Point ($^{\circ}C$):

140.5 (Hartley & Kidd 1987; Howard 1991; Lide 2003)

Boiling Point ($^{\circ}C$):

160 (at 0.4 mmHg, Dean 1985; Howard 1991)

215 (Neely & Blau 1985)

Density (g/cm^3 at $30^{\circ}C$):

1.565 (Neely & Blau 1985)

Molar Volume (cm^3/mol):

206.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

2.77 (potentiometric, Nelson & Faust 1969)

2.87 (spectrophotometric, Cessna & Grover 1978)

2.80 (Reinert & Rogers 1984)

2.64–3.31 (Howard 1991)

2.80 (selected, Wauchope et al. 1992)

2.97 (Sangster 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.0736 (mp at $140.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

522 (shake flask-UV, Leopold et al. 1960)

725 (Bailey & White et al. 1965)

725, 400, 900, 550 (review, Günther et al. 1968)

890 (Hamaker 1975)

900 (Kenaga 1980a,b; Kenaga & Goring 1980)

600 ($20^{\circ}C$, Khan 1980)

470 (20 – $25^{\circ}C$, pH 5.6, Geyer et al. 1981)

633, 812 (15, $25^{\circ}C$, shake flask method, average values of 5 laboratories, OECD 1981)

620 ($20^{\circ}C$, Kidd & Hartley 1987; Worthing 1983)

609 (Gerstl & Helling 1987)

682 (Yalkowsky et al. 1987; quoted, Howard 1991)

703 (Gustafson 1989)

900, 600, 890, 703, 1072 (quoted, Wauchope et al. 1992)

890 (20 – $25^{\circ}C$, selected, Wauchope et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated):

8.0×10^{-5} (Hamaker 1975)

0.180–1.69 (transpiration method, Spencer 1976)

53.0 ($160^{\circ}C$, Kidd & Hartley 1983, 1987)

8.0×10^{-5} (recommended, Neely & Blau 1985; Lyman 1985)

1.00 ($20^{\circ}C$, selected, Suntio et al. 1988)

- 0.0032 (estimated from Henry's law constant, Howard 1991)
 5.6×10^{-5} (selected, Mackay & Stiver 1991)
 1.3×10^{-5} , 8.0×10^{-5} , 1.07×10^{-3} (quoted, Wauchope et al. 1992)
0.00107 (20–25°C, selected, Wauchope et al. 1992)

Henry's Law Constant (Pa·m³/mol):

- 0.55 (calculated-P/C, Suntio et al. 1988)
 1.03×10^{-3} (calculated-bond contribution, Howard 1991)

Octanol/Water Partition Coefficient, log K_{OW}:

- 2.81 (shake flask-AS, Fujita et al. 1964; Leo et al. 1971; Hansch & Leo 1979; Hansch & Leo 1985)
2.59 (electrometric titration, Freese et al. 1979)
1.57 (Kenaga & Goring 1980, Kenaga 1980b)
1.57, 4.88 (shake flask-OECD 1981 Guidelines, Geyer et al. 1984)
−1.36 (Gerstl & Helling 1987)
2.65 (shake flask, Hansch & Leo 1987)
2.65 (centrifugal chromatography, Ilchmann et al. 1993)
2.81 (recommended, Sangster 1993)
2.81 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

- 1.11, −0.097 (calculated-S, K_{OW}, Kenaga 1980a)
−2.46, 1.30 (beef fat, fish, Kenaga 1980b)
0.778, 1.94 (alga *Chlorella fusca*: exptl. 24 h exposure, calculated-S, Geyer et al. 1981)
0.778, < 1.0, 1.23 (algae, golden orfe, activated sludge, Freitag et al. 1982)
0.00 (fish, microcosm conditions, Garten & Trabalka 1983)
0.778, 1.23 (algae, calculated-K_{OW}, Geyer et al. 1984)
1.11 (calculated, Isensee 1991)
−5.0 (bluegill sunfish and channel catfish, Howard 1991)
−2.70 (frog tadpoles, Howard 1991)
−3.0, −2.52 (pH 7.8, seaweeds, Howard 1991)
0.778, 0.85 (quoted: alga, fish, Howard 1991)

Sorption Partition Coefficient, log K_{OC}:

- 1.30, 2.0 (quoted, calculated, Kenaga 1980a)
1.30, 2.11 (quoted, Kenaga & Goring 1980)
1.68, 1.86, 1.68; 1.76 (commerce soil, Tracy soil, Catlin soil; average value of 3 soils, McCall et al. 1981)
2.25, 2.04, 2.35 (soil I-very strongly acid sandy soil pH 4.5–5.5, soil II-moderately or slightly acid loamy soil pH 5.6–6.5, soil III-slightly alkaline loamy soil pH 7.1–8.0, OECD 1981)
1.29 (soil, Neely & Blau 1985)
1.61 (soil, quoted, Sabljic 1987)
1.75, 2.00 (quoted, calculated-MCI χ , Gerstl & Helling 1987)
1.29–2.13 (soil, quoted values, Howard 1991)
1.30 (selected, Mackay & Stiver 1991)
1.00, 1.23, 2.29 (sediment, Alfisol soil, Podzol soil, von Oepen et al. 1991)
1.30, 1.78, 1.51, 1.26, 1.72, 1.75, 1.76 (soil, quoted, Wauchope et al. 1992)
1.30 (soil, selected, Wauchope et al. 1992)
0.68 (calculated-K_{OW}, Kollig 1993)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

- Volatilization: volatilization from water is negligible, calculated volatilization t_{1/2} = 660 d from soil of 1 cm deep and t_{1/2} = 7.1 yr from 10 cm deep (Howard 1991).
Photolysis: aqueous photolysis t_{1/2} = 2–4 d when irradiated at 356 nm, t_{1/2} = 50 min in water when irradiated at 254 nm, and t_{1/2} = 29–43 d when exposed to September sunlight (Howard 1991).

Oxidation: photooxidation $t_{1/2} = 1.8\text{--}18$ h, based on estimated rate constant for the vapor-phase reaction with hydroxyl radicals in air (Howard et al. 1991).

Hydrolysis: no hydrolyzable groups and rate constant at neutral pH is zero (Kollig et al. 1987; selected, Howard et al. 1991); generally resistant to hydrolysis, may become important at $\text{pH} > 8$ (Howard 1991).

Biodegradation: degradation kinetics not first-order, time for 50% decomposition in six soils: $t_{1/2} = 5$ d in Commerce soil, $t_{1/2} = 1.5$ d in Catlin soil, $t_{1/2} = 3.9$ d in Keith soil, $t_{1/2} = 3.0$ d in Cecil soil, $t_{1/2} = 2.5$ d in Walla-Walla soil and $t_{1/2} = 8.5$ d in Fargo soil, with an average time of 4 d (McCall et al. 1981);

easily degraded under aerobic conditions with $t_{1/2} = 1.8$ and 3.1 d for cometabolism and metabolism respectively, under anaerobic conditions the degradation rate decreases and the $t_{1/2} = 69$ and 135 d (Liu et al. 1981; quoted, Muir 1991);

second-order $k = (3.6\text{--}28.8) \times 10^{-6}$ $\text{mL cell}^{-1} \text{d}^{-1}$ in natural water (Paris et al. 1981; quoted, Klečka 1985);

first-order $k < 0.14\text{--}0.07$ d^{-1} in river water at 25°C (Nesbitt & Watson 1980; quoted, Klečka 1985);

$k = 0.058 \pm 0.006$ d^{-1} in lake water at 29°C (Subba-Rao et al. 1982; quoted, Klečka 1985; quoted, Muir 1991);

$k = 0.08\text{--}0.46$ d^{-1} in soil at 25°C (McCall et al. 1981; quoted, Klečka 1985);

$t_{1/2}(\text{aq. aerobic}) = 240\text{--}1200$ h, based on unacclimated aerobic river die-away test data (Nesbitt & Watson 1980a, b; quoted, Howard et al. 1991; Muir 1991);

$t_{1/2}(\text{aq. anaerobic}) = 672\text{--}4320$ h, based on unacclimated aqueous screening test data (Liu et al. 1981; selected, Howard et al. 1991);

first-order $k = 0.035$ d^{-1} in die-away test, $k = 0.029$ d^{-1} in CO_2 evolution test in soil and $k = 6.9 \times 10^{-1}$ $\text{mL} \cdot (\text{g bacteria})^{-1} \cdot \text{d}^{-1}$ by activated sludge cultures (Scow 1982);

biodegradation $t_{1/2} = 18$ to > 50 d in clear river water and $t_{1/2} = 10$ to 25 d in muddy water with lag times of 6 to 12 d; degradation with a mixture of microorganisms from activated sludge, soil, and sediments lead to $t_{1/2} = 1.8\text{--}3.1$ d under aerobic conditions and $t_{1/2} = 69\text{--}135$ d under anaerobic conditions (Howard 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 1.8\text{--}18$ h, based on estimated rate constant for the vapor-phase reaction with hydroxyl radicals in air (Howard et al. 1991);

photooxidation $t_{1/2} = 23.9$ h for reactions with hydroxyl radicals in air (Howard 1991).

Surface water: $t_{1/2} = 48\text{--}96$ h, based on reported photolysis half-lives for aqueous solution irradiated at UV wavelength of 356 nm (Howard et al. 1991);

degradation $t_{1/2} = 14$ d in sensitized, filtered and sterilized river water, based on sunlight photolysis test of $1 \mu\text{g mL}^{-1}$ in distilled water (Zepp et al. 1975; quoted, Cessna & Muir 1991);

typical biodegradation $t_{1/2} = 10$ to < 50 d with longer expected in oligotrophic waters, photolysis $t_{1/2} = 29\text{--}43$ d for water solutions irradiated at sunlight (Howard 1991).

Groundwater: $t_{1/2} = 480\text{--}4320$ h, based on estimated unacclimated aqueous aerobic and anaerobic biodegradation half-lives (Howard et al. 1991).

Sediment: $t_{1/2} < 1$ d for degradation in sediments and lake muds (Howard 1991).

Soil: $t_{1/2} = 240\text{--}1200$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

biodegradation $t_{1/2} < 1$ d to several weeks, $t_{1/2} = 3.9$ and 11.5 d in 2 moist soils and $t_{1/2} = 9.4$ to 254 d in the same soils under dry conditions (Howard 1991);

field $t_{1/2} = 2\text{--}16$ d, with a selected value of 10 d (Wauchope et al. 1992).

Biota: depuration $t_{1/2} = 13.8$ h in daphnids, $t_{1/2} = 1.32$ d in catfish (Ellgehausen et al. 1980).

TABLE 13.2.3

Suggested half-life classes for carboxylic acids in various environmental compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Aliphatics:				
Formic acid	4	3	4	5
Acetic acid	3	3	4	5
Butyric acid	3	3	4	5
Hexanoic acid (Caproic acid)	3	3	4	5
Stearic acid (Octadecanoic acid)	3	3	4	5
Acrylic acid (2-Propenoic acid)	2	3	4	5
Vinylacetic acid	2	3	4	5
Chloroacetic acid	5	4	5	6
Aromatics:				
Benzoic acid	3	3	4	5
2-Methylbenzoic acid (<i>o</i> -Toluic acid)	3	3	4	5
Phenylacetic acid	3	3	4	5
Phthalic acid	3	3	4	5
2-Chlorobenzoic acid	4	5	6	7
Salicylic acid	3	3	4	5
2,4-Dichlorophenoxyacetic acid (2,4-D)	2	3	5	6
2,4,5-Trichlorophenoxyacetic acid (2,4,5-T)	3	4	6	7

where,

Class	Mean half-life (hours)	Range (hours)
1	5	<10
2	17 (~1 d)	10–30
3	55 (~2 d)	30–100
4	170 (~1 week)	100–300
5	550 (~3 weeks)	300–1,000
6	1,700 (~2 months)	1,000–3,000
7	5,500 (~8 months)	3,000–10,000
8	17,000 (~2 y)	10,000–30,000
9	~5 y	>30,000

FIGURE 13.2.1 Molar solubility (liquid or supercooled liquid) versus Le Bas molar volume for carboxylic acids.

14 Phenolic Compounds

CONTENTS

14.1	List of Chemicals and Data Compilations	2781
14.1.1	Alkylphenols and other substituted phenols	2781
14.1.1.1	Phenol	2781
14.1.1.2	<i>o</i> -Cresol	2794
14.1.1.3	<i>m</i> -Cresol	2803
14.1.1.4	<i>p</i> -Cresol	2812
14.1.1.5	2,3-Dimethylphenol	2821
14.1.1.6	2,4-Dimethylphenol	2825
14.1.1.7	2,5-Dimethylphenol	2831
14.1.1.8	2,6-Dimethylphenol	2834
14.1.1.9	3,4-Dimethylphenol	2838
14.1.1.10	3,5-Dimethylphenol	2842
14.1.1.11	2,3,5-Trimethylphenol	2845
14.1.1.12	2,4,6-Trimethylphenol	2848
14.1.1.13	3,4,5-Trimethylphenol	2849
14.1.1.14	<i>o</i> -Ethylphenol	2850
14.1.1.15	<i>p</i> -Ethylphenol	2853
14.1.1.16	4-Propylphenol	2857
14.1.1.17	<i>p</i> - <i>tert</i> -Butylphenol	2858

14.1 LIST OF CHEMICALS AND DATA COMPILATIONS

14.1.1 ALKYLPHENOLS AND OTHER SUBSTITUTED PHENOLS

14.1.1.1 Phenol

Common Name: Phenol

Synonym: carbolic acid, phenic acid, phenylic acid, phenyl hydrate, phenyl hydroxide, hydroxybenzene, oxybenzene

Chemical Name: phenol

CAS Registry No: 108-95-2

Molecular Formula: C_6H_5OH

Molecular Weight: 94.111

Melting Point ($^{\circ}C$):

40.89 (Lide 2003)

Boiling Point ($^{\circ}C$):

181.87 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.5479 (supercooled liq., Ericksen & Dobbert 1955)

1.0576 (Weast 1982)

Acid Dissociation Constant, pK_a :

9.90 (Blackman et al. 1955, McLeese et al. 1979)

10.02 (Herington & Kynaston 1957; Callahan et al. 1979)

9.82 (Sillén & Martell 1971; Kaiser et al. 1984; Shigeoka et al. 1988)

10.0 (Serjeant & Dempsey 1979; Paris et al. 1982; Miyake et al. 1987; Tratnyek & Hoigné 1991)

9.92 (Könemann 1981; Könemann & Musch 1981; Ugland et al. 1981; Varhaníčková et al. 1995)

10.05 (Saarikoski 1982; Saarikoski & Viluksela 1982)

9.90 (UV absorption, Hoigné & Bader 1983; Scully & Hoigné 1987)

9.99 (Dean 1985; Schultz & Cajina-Quezada 1987; Hersey et al. 1989)

10.93 (Miyake et al. 1987)

10.12 (UV spectrophotometry, Nendza & Seydel 1988)

Molar Volume (cm^3/mol):

89.0 ($20^{\circ}C$, calculated-density)

103.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

56.13, 45.83 ($25^{\circ}C$, bp, Dreisbach 1955)

47.30 (at normal bp, Biddiscombe & Martin 1958)

45.689 (at normal boiling point, Andon et al. 1960)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

68.66 (at $25^{\circ}C$, Biddiscombe & Martin 1958; Andon et al. 1960)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.514 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

36.63 (Tsonopoulos & Prausnitz 1971)

36.0, 56.5 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.698 (mp at $40.89^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

86600* (synthetic method, measured range $20-65.86^{\circ}C$, Hill & Malisoff 1926)

83000 ($20^{\circ}C$, synthetic method, Jones 1929)

89300* ($22.7^{\circ}C$, thermostatic and synthetic methods, measured range $22.7-60.9^{\circ}C$, Morrison 1944)

- 88360 (shake flask-UV at pH 5.1, Blackman et al. 1955)
 79000* (20°C, synthetic method/shake flask-optical, measured range 0–68.3°C, Ericksen & Dobbert 1955)
 80000 (20°C, Mulley & Metcalf 1966)
 78000 (shake flask-spectrophotometry, Roberts et al. 1977)
 79750 (shake flask-GC, Kraij & Sincic 1980)
 76514 (generator column-HPLC, Wasik et al. 1981)
 150580 (20°C, shake flask-UV, Hashimoto et al. 1984)
 87000 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)
 84045* (shake flask-conductimetry, measured range 15.1–35°C, Achard et al. 1996)
 94100* (25.35°C, shake flask-optical method, measured range 298.5–336.7 K, Jaoui et al. 1999)
 83119* (23.15°C, shake flask-optical method, measured range 292.5–333.6 K, Jaoui et al. 2002)
 $\ln [S/(\text{mol kg}^{-1})] = 7.3013 - 853.62/(T/K)$; temp range 288–313 K (eq.-I derived using reported exptl. data, Jaoui et al. 2002)
 $\ln [S/(\text{mol kg}^{-1})] = 10.731 - 1931.7/(T/K)$; temp range 313–332 K (eq.-II derived using reported exptl. data, Jaoui et al. 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 133.3* (44.8 °C, static method-manometer, measured range 44.8–181.4 °C, Kahlbaum 1898)
 28531* (141.1 °C, mercury manometer, measured range 141.1–181.1 °C, Goldblum et al. 1947)
 $\log (P/\text{mmHg}) = -2510/(T/K) + 8.395$; temp range: 141.1–181.1°C (Hg manometer, Goldblum et al. 1947)
 55.54* (extrapolated-regression of tabulated data, temp range 40.1–181.9°C, Stull 1947)
 7605* (107.15 °C, ebulliometry, measured range 107.15–181.75 °C, Dreisbach & Shrader 1949)
 1333* (70.50 °C, ebulliometry, measured range 70.50–181.7 °C, Vonterres et al. 1955)
 70.75 (calculated-Antoine eq., Dreisbach 1955)
 $\log (P/\text{mmHg}) = 7.57893 - 1817.0/(205.0 + t/^{\circ}\text{C})$, temp range: 93–240°C, (Antoine eq. for liquid state, Dreisbach 1955)
 44.26* (24.85°C, gas saturation and diaphragm manometer measurements, measured range 0–37.5°C, Biddiscombe & Martin 1958)
 45.71 (gas saturation and diaphragm manometer fitted to Antoine eq., Biddiscombe & Martin 1958)
 $\log (P/\text{mmHg}) = 11.5638 - 3586.36/(t/^{\circ}\text{C} + 273)$; temp range 9–40°C (Antoine eq. from gas-saturation and diaphragm manometer methods, Biddiscombe & Martin. 1958; Andon et al. 1960)
 $\log (P_L/\text{mmHg}) = 7.13457 - 1615.072/(t/^{\circ}\text{C} + 174.569)$; temp range 110–200°C (Antoine eq. from gas-saturation and diaphragm manometer methods, Biddiscombe & Martin. 1958; Andon et al. 1960)
 45.07 (interpolated- Antoine eq., Andon et al. 1960)
 70.70 (20°C, supercooled liq., Andon et al. 1960)
 83.95 (extrapolated supercooled liquid value, Antoine eq., Weast 1972–73)
 $\log (P/\text{mmHg}) = [-0.2185 \times 11891.5/(T/K)] + 8.513843$; temp range 40.1–418.7°C (Antoine eq., Weast 1972–73)
 47.01 (extrapolated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 7.13301 - 1516.79/(174.954 + t/^{\circ}\text{C})$; temp range 107–182°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1973)
 26.66, 133.3 (20°C, 40°C, Verschuereen 1977, 1983)
 16.27 (extrapolated-Cox eq., Chao et al. 1983)
 $\log (P/\text{mmHg}) = [1 - 454.610/(T/K)] \times 10^{\{1.00375 - 8.88757 \times 10^{-4} \cdot (T/K) + 6.83750 \times 10^{-7} \cdot (T/K)^2\}}$; temp range: 323.205–694.25 K, (Cox eq., Chao et al. 1983)
 46.91, 54.74 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.25543 - 1515.182/(174.182 + t/^{\circ}\text{C})$; temp range 107–181.75°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.70346 - 1793.899/(200.218 + t/^{\circ}\text{C})$; temp range 70.5–181.7°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 47.00 (extrapolated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 7.1330 - 1516.79/(174.95 + t/^{\circ}\text{C})$; temp range 107–182°C (Antoine eq., Dean 1985, 1992)
 55.00 (selected, Riddick et al. 1986)
 45.7, 45.32 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_S/\text{kPa}) = 10.6887 - 3586.36/(T/\text{K})$; temp range 282–313 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)

$\log (P_S/\text{kPa}) = 10.71099 - 3594.703/(T/\text{K})$; temp range 273–313 K (Antoine eq.-II, solid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.25947 - 1516.072/(-98.581 + T/\text{K})$; temp range 383–473 K (Antoine eq.-III, liquid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.34757 - 1482.82/(-113.862 + T/\text{K})$; temp range 455–655 K (Antoine eq.-IV, liquid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.57957 - 1710.287/(-80.273 + T/\text{K})$; temp range 314–395 K (Antoine eq.-V, liquid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.26694 - 1522.07/(-97.834 + T/\text{K})$; temp range 387–456 K (Antoine eq.-VI, liquid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.30177 - 1548.368/(-94.612 + T/\text{K})$; temp range 449–526 K (Antoine eq.-VII, liquid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.92874 - 2146.053/(-17.025 + T/\text{K})$; temp range 520–625 K (Antoine eq.-VIII, liquid, Stephenson & Malanowski 1987)

61.16 (extrapolated-four-parameter vapor pressure eq., Nesterova et al. 1990)

$\log (P/\text{Pa}) = 37.91650 - 4155.615/(T/\text{K}) - 9.02308 \cdot \log (T/\text{K}) + 0.04526 \times 10^{-2} \cdot (T/\text{K})$; temp range: 394–455 K (four-parameter vapor pressure eq. using exptl data of Biddiscombe & Martin 1958, Nesterova et al. 1990)

$\log (P/\text{Pa}) = 127.08645 - 7292.585/(T/\text{K}) - 42.92601 \cdot \log (T/\text{K}) + 1.76834 \times 10^{-2} \cdot (T/\text{K})$; temp interval of investigation 380–455 K (four-parameter vapor pressure eq. derived using data of Dreisbach & Shrader 1949, Nesterova et al. 1990)

$\log (P/\text{mmHg}) = 23.5332 - 3.4961 \times 10^3/(T/\text{K}) - 4.899 \cdot \log (T/\text{K}) + 1.216 \times 10^{-4} \cdot (T/\text{K}) + 9.6537 \times 10^{-13} \cdot (T/\text{K})^2$; temp range 314–694 K (vapor pressure eq., Yaws 1994)

173* (40.09°C, ebulliometry, measured range 40–90°C, Tabai et al. 1997)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.0402 (exptl., Hine & Mookerjee 1975; Howard 1989)

0.065, 1.082 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

0.0718* (27.0°C, gas stripping-GC, measured range –2.0 to 27.0°C Abd-El-Bary et al. 1986)

$k_H/\text{kPa} = 2.69 \times 10^9 \exp[-6120/(T/\text{K})]$, temp range –2 to 90°C (gas stripping-GC measurements plus reported data at higher temp., Abd-El-Bary et al. 1986)

1.245, 2.193, 3.322 (75.9, 88.7, 98.5°C, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)

0.0607* (extrapolated from temp dependence eq., Dohnal & Fenclová 1995)

$\ln K_{AW} = 8.701 - 5760/(T/\text{K})$, temp range 20–100°C (vapor-liquid equilibrium measurements with additional literature data, Dohnal & Fenclová 1995)

0.0342* (313.24 K, derived from measured P, temp range 313.240–363.14 K, Tabai et al. 1997)

$k_H/\text{kPa} = 670.117 - 39274.5/(T/\text{K}) - 94.6679$; temp range 313–363 K (activity coefficient by ebulliometric method, Tabai et al. 1997)

< 0.240 (gas stripping-GC, Altschuh et al. 1999)

0.0536 (20°C, single equilibrium static technique SEST, Sheikheldin et al. 2001)

0.0320* (gas stripping-UV, measured range 284–302 K, Harrison et al. 2002)

$\ln [H/(M \text{ atm}^{-1})] = 5850/(T/\text{K}) - 11.6$; temp range 284–302 K, Harrison et al. 2002)

0.157* (dynamic equilibrium/gas stripping-GC/MS, measured range 5–25°C, Feigenbrugel et al. 2004)

Octanol/Water Partition Coefficient, $\log K_{OW}$. Additional data at other temperatures designated * are compiled at the end of this section:

1.46 (shake flask-UV, Fujita et al. 1964)

1.46 ± 0.01 (shake flask-UV, Iwasa et al. 1965)

1.42 (shake flask-UV at pH 7.4, Rogers & Cammarata 1969)

1.60 (shake flask, Kiezyk & Mackay 1971)

1.47 (Leo et al. 1971)

1.51 (shake flask-UV at pH 7.45, Umeyama et al. 1971)

1.49 (shake flask, Korenman 1972)

- 1.510* (20 °C, shake flask-concn ratio, measured range 10–60 °C, Korenman & Udalova 1974)
 1.46, 1.61 (LC- k' correlation, calculated- π const., Carlson et al. 1975)
 1.54 (shake flask-UV, Davis et al. 1976)
 1.45 (HPLC-RT correlation, Mirreles et al. 1976)
 1.48 \pm 0.02 (shake flask at pH 7, Unger et al. 1978)
 1.48, 1.46, 1.49, 1.51, 0.62, 2.20 (literature values, Hansch & Leo 1979)
 1.46 (HPLC- k' correlation, Butte et al. 1981; Butte et al. 1987)
 1.45 (generator column-HPLC/UV, Wasik et al. 1981)
 1.54 (RP-HPLC- k' correlation, D'Amboise & Hanai 1982)
 1.28, 1.54 (RP-LC- k' correlation, calculated-fragment const. as per Rekker 1977, Hanai & Hubert 1982)
 1.54 (HPLC- k' correlation, Miyake & Terada 1982; Miyake et al. 1987)
 1.62 (inter-laboratory, shake flask average, Eadsforth & Moser 1983)
 1.16 (inter-laboratory, HPLC average, Eadsforth & Moser 1983)
 1.49, 1.53 \pm 0.09 (selected best lit. value, exptl.-ALPM, Garst 1984)
 1.46, 1.55 \pm 0.07 (selected best lit. value, exptl.-ALPM, Garst & Wilson 1984)
 1.08 (calculated-activity coeff. γ from UNIFAC, Campbell & Luthy 1985)
 1.46 (RP-HPLC-RT correlation, Chin et al. 1986)
 1.00, 1.42 (HPLC- k' correlation, Eadsforth 1986)
 1.46 (shake flask-CPC centrifugal partition chromatography, Berthod et al. 1988)
 1.46 (RP-HPLC-capacity ratio correlation, Minick et al. 1988)
 1.46 (HPLC-RT correlation, Shigeota et al. 1988)
 1.52 \pm 0.01 (filter chamber-UV, Hersey et al. 1989)
 1.50 (recommended, Sangster 1989, 1993)
 1.52, 1.58, 1.69 (CPC-RV correlation, Gluck & Martin 1990)
 1.47 (shake flask-UV, Kramer & Henze 1990)
 1.37 \pm 0.06 (liquid-liquid extraction-flow injection-UV, Kubá 1991)
 1.57 (shake flask-GC, Kishino & Kobayashi 1994)
 1.46 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

- 4.16 (total ^{14}C in fathead minnow, mean exposure level 0.0025 $\mu\text{g}\cdot\text{mg}^{-1}$, Call et al. 1980)
 4.23 (total ^{14}C in fathead minnow, mean exposure level 0.0327 $\mu\text{g}\cdot\text{mg}^{-1}$, Call et al. 1980)
 4.20 (total ^{14}C in fathead minnow, mean value, Call et al. 1980)
 2.20 (goldfish, rate constant ratio k_1/k_2 , Nagel & Ulrich 1980)
 0.97 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
 1.30, 2.30, 3.34 (golden ide, algae, activated sludge, Freitag et al. 1985)
 2.30 (*chlorella fusca*, Freitag et al. 1985; quoted, Howard 1989)
 1.20 (algae, maximum apparent BCF, Hardy et al. 1985)
 0.544 (algae, real BCF with biotransformation, Hardy et al. 1985)
 3.14 (*daphnia magna*, estimated- ^{14}C activity and on dry wt. basis, Dauble et al. 1986)
 2.44 (*daphnia magna*, based on elimination phase, Dauble et al. 1986)
 1.28 (*daphnia magna*, Dauble et al. 1986; quoted, Geyer et al. 1991)
 1.24 (zebrafish, Butte et al. 1987)

Sorption Partition Coefficient, log K_{OC} :

- 1.43 (soil, Kenaga & Goring 1980)
 1.48 (20°C, sorption isotherm, converted form K_{OM} organic carbon in soils, Briggs 1981)
 1.15 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 1.57, 1.96 (silt loams, Scott et al. 1983, quoted, Howard 1989)
 3.46 (untreated fine sediment, Isaacson & Frink 1984)
 3.49 (untreated coarse sediment, Isaacson & Frink 1984)
 1.35 (HPLC- k' correlation, mobile phase buffered to pH 3, Hodson & Williams 1988)
 2.17 (soil, calculated- K_{OW} , Howard 1989)
 2.4, 2.43 (soil: quoted, calculated-MCI χ , Meylan et al. 1992)

- 2.68, 2.38 (natural zeolite modified with a cation surfactant HDTMA with surface coverage of 100, 200 mmol/kg at pH 7, shake flask-sorption isotherm, Li et al. 2000)
- 1.43 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
- 1.42, 1.00. 1.24 (RP-HPLC- k' correlation on 3 different stationary phases, Szabo et al. 1995)
- 1.59, 1.67 (HP:LC- k' correlation, C_{18} column, Hong et al. 1996)
- 1.32; 2.43 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1998)
- 1.56, 1.556, 1.255, 1.307, 1.52 (soil, first generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV, Gawlik et al. 1998, 1999)
- 1.310, 1.750, 1.281, 1.601, 1.544 (soil, second generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV, Gawlik et al. 1999)
- 1.310, 1.750, 1.281, 1.601, 1.544 (soil, second generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV and HPLC- k' correlation, Gawlik et al. 2000)
- 1.37, 1.34 (soils: organic carbon $OC \geq 0.1\%$ and pH 3.2–7.4, $OC \geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k , or Half-lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} \sim 3.2$ months for evaporation from water (Howard 1989);

$t_{1/2} = 88$ d, calculated for evaporation from a model river of 1 m deep with a current of 3 m/s and with a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1989).

Photolysis: phototransformation rate $k = 0.015 \text{ h}^{-1}$ with $t_{1/2} = 46$ h in the summer (mean temp 24°C) and $k = 0.0040 \text{ h}^{-1}$ with $t_{1/2} = 173$ h in the winter (mean temp 10°C) in distilled water; $k = 0.018 \text{ h}^{-1}$ with $t_{1/2} = 39$ h in the summer and $k = 0.0074 \text{ h}^{-1}$ with $t_{1/2} = 94$ h in the winter in estuarine water when exposed to full sunlight and microbes (Hwang et al. 1986);

photomineralization rate $k = 0.04 \text{ h}^{-1}$ with $t_{1/2} = 16$ d in the summer and $k = 0.0041 \text{ h}^{-1}$ with $t_{1/2} = 169$ d in the winter in distilled water; $k = 0.095 \text{ h}^{-1}$ with $t_{1/2} = 7$ d in the summer and $k = 0.010 \text{ h}^{-1}$ with $t_{1/2} = 73$ d in winter in estuarine water when exposed to full sunlight and microbes (Hwang et al. 1986);

atmospheric $t_{1/2} = 46$ to 173 h, based on reported half-life for photolysis under sunlight for phenol in distilled water in the summer and winter; aquatic photolysis $t_{1/2} = 46$ to 173 h, based on reported half-life for photolysis under sunlight for phenol in distilled water in the summer and winter (Howard et al. 1991)

Apparent first-order rate constant phototransformation at $\lambda > 285 \text{ nm}$, $k = (3.10 \pm 0.10) \times 10^{-2} \text{ h}^{-1}$ in purified water (Zamy et al. 2004)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 0.8$ d (Howard 1972; Hendry et al. 1974; quoted, Mill 1982)

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen at 25°C with $t_{1/2} > 100$ yr (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{\text{NO}_3} = (2.0 \pm 0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $(300 \pm 1) \text{ K}$ (Carter et al. 1981)

$k = 6.5 \times 10^3 \text{ s}^{-1}$, dye-sensitized photooxidation first-order rate constant, second order $k = (1.3 \pm 0.2) \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water using 1 mM PrOH as scavenger at pH 1.7–2.0 and $20\text{--}23^\circ\text{C}$ (Hoigné & Bader 1983a)

$k_{\text{NO}_3} = (2.10 \pm 0.50) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ (Atkinson et al. 1984)

$k_{\text{NO}_3} = (3.64 \pm 0.14) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 294 K with reference to reaction for NO_3 radical with 2-methyl-2-butene (Atkinson et al. 1984; quoted, Atkinson 1991)

$k_{\text{OH}}(\text{exptl}) = 28.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = 45.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1985)

$k_{\text{OH}}(\text{calc}) = 36 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{obs}) = 28.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987; quoted, Sabljic & Güsten 1990; Müller & Klein 1991)

$k = (2 \text{ to } 3) \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 8, $1.9 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 9, $4.6 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 9.5, $9.0 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 10 and $1.8 \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ at pH 11.5 for the reaction with singlet oxygen at $(19 \pm 2)^\circ\text{C}$ in water (Scully & Hoigné 1987)

$k_{\text{NO}_3} = 3.63 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson et al. 1988; quoted, Sabljic & Güsten 1990; Müller & Klein 1991)

$k_{\text{OH}} = 26.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

$k_{\text{NO}_3} = (2.59 \pm 0.52) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $300 \pm 1 \text{ K}$ with reference to reaction for NO_3 radicals with *cis*-2-butene (Atkinson 1991)

$k = (2.6 \pm 4) \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen in aqueous phosphate buffer at $(27 \pm 1)^\circ\text{C}$ (Tratnyek & Hoigné 1991)

$k_{\text{OH}} = 10.45 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{NO}_3} = 11.44 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Müller & Klein 1991)

$k_{\text{NO}_3} = (3.92 \pm 0.25) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ with reference to reaction for NO_3 radical with 2-methyl-2-butene; $k_{\text{OH}} = 26.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1992)

$k_{\text{OH}}(\text{calc}) = 12 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital estimation method, Klamt 1993)

$k_{\text{OH}} = 2.6 \times 10^{-11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{aq.}) = 6.7 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$, the calculated atmospheric lifetime $\tau = 0.45 \text{ d}$ under clear sky; $\tau = 0.38 \text{ d}$ under cloudy conditions at 298 K , reduced to 0.26 d due the average temperature of tropospheric clouds at 283 K (Feigenbrugel et al. 2004)

Hydrolysis: no hydrolyzable function group (Howard et al. 1991).

Biodegradation: $t_{1/2} = 1\text{--}2 \text{ d}$ for bacteria to utilize 95% of 300 ppm in parent substrate (Tabak et al. 1964)

decomposition by soil microflora within 1 d (Alexander & Lustigman 1966; quoted, Verschueren 1983)

complete disappearance in soil suspensions in 2 d (Woodcock 1971; quoted, Verschueren 1983)

$k_{\text{B}} = 80.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982)

$k_{\text{B}} = (0.094 \pm 0.003) \text{ h}^{-1}$ at feed concentration of 180 mg/L at 20°C and $k = (0.095 \pm 0.007) \text{ h}^{-1}$ at feed concentration of 360 mg/L at 20°C in a continuous stirred reactor (Beltrame et al. 1984)

$k_{\text{B}} = 0.035 \text{ d}^{-1}$ with $t_{1/2} = 20 \text{ d}$ in ground water; $k_{\text{B}} = 0.065 \text{ d}^{-1}$ with $t_{1/2} = 11 \text{ d}$ in Lester River water;

$k_{\text{B}} = 0.247 \text{ d}^{-1}$ with $t_{1/2} = 3 \text{ d}$ in Superior harbor waters (Vaishnav & Babeu 1987)

$k_{\text{B}} = 0.03 \text{ h}^{-1}$ and $t_{1/2} = 28 \text{ h}$ for estuarine water in summer (mean temp 24°C) and $k_{\text{B}} = 0.011 \text{ h}^{-1}$ with $t_{1/2} = 62 \text{ h}$ in winter (mean temp. 10°C); $k_{\text{B}} = 0.4 \text{ h}^{-1}$ with $t_{1/2} = 2 \text{ d}$ in summer and $k_{\text{B}} = 0.0051 \text{ h}^{-1}$ with $t_{1/2} = 146 \text{ d}$ in winter in darkness with microbes (Hwang et al. 1986)

$k_{\text{B}} = 0.041\text{--}0.028 \text{ h}^{-1}$ in $10\text{--}100 \text{ mg/L}$ sludge (Urano & Kato 1986)

complete degradation within 1 d in water from 3 lakes, and degradation is somewhat slower in salt water with $t_{1/2} = 9 \text{ d}$ in estuary river (Howard 1989)

$k_{\text{B}}(\text{exptl., average}) = 0.0498 \text{ h}^{-1}$; $k_{\text{B}}(\text{calc}) = 0.0545 \text{ h}^{-1}$ (nonlinear) and $k_{\text{B}}(\text{calc}) = 0.0503 \text{ h}^{-1}$ (linear) (group contribution method, Tabak & Govind 1993)

$t_{1/2}(\text{aerobic}) = 0.25 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 8.0 \text{ d}$ in natural waters (Capel & Larson 1995)

Biotransformation: microbial transformation $k = (7.1 \pm 1.3) \times 10^{-12} \text{ L.organism}^{-1} \text{ h}^{-1}$ (Paris et al. 1982);

estimated bacterial transformation $k = 3 \times 10^{-6} \text{ mL cell}^{-1} \text{ h}^{-1}$ in water (Mabey et al. 1982);

microbial transformation rate constants in pond and river samples $k = (2.0 \pm 1.5) \times 10^{-10}$ to $(4.8 \pm 3.1) \times 10^{-10} \text{ L organism}^{-1} \text{ h}^{-1}$ at five different sites (Paris et al. 1983; quoted, Steen 1991);

degradation rate constants $k = 1.08 \times 10^{-16} \text{ mol cell}^{-1} \text{ h}^{-1}$ from pure culture studies and $k = 0.90 \times 10^{-12}$ to $3.00 \times 10^{-12} \text{ mol cell}^{-1} \text{ h}^{-1}$ with microorganisms in Seneca River waters (Banerjee et al. 1984).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 3.15 \text{ h}^{-1}$; $k_2 = 0.02 \text{ h}^{-1}$ (goldfish, Nagel & Urich 1980)

Half-Lives in the Environment:

Air: $t_{1/2} = 0.61 \text{ d}$ by reaction with OH radicals in air (Howard 1989);

$t_{1/2} = 2.28$ to 22.8 h , based on reaction with OH radical (Howard et al. 1991)

degradation $k = 0.0462 \text{ d}^{-1}$ corresponding to $t_{1/2} = 360 \text{ h}$ in air (Guinee & Heijungs 1993);

atmospheric transformation lifetime was estimated to be $< 1 \text{ d}$ (Kelly et al. 1994);

calculated lifetimes of 5.3 h and 9.0 min for reactions with OH, NO_3 radical, respectively (Atkinson 2000).

atmospheric lifetime $\tau = 0.45 \text{ d}$ under clear sky and $\tau = 0.38 \text{ d}$ under cloudy conditions based on reactions with OH radical in gas and aqueous phases at 298 K , reduced to $\tau = 0.26 \text{ d}$ due to average temperature of tropospheric cloud at 283 K (Feigenbrugel et al. 2004)

Surface water: rate constant $k = (1.3 \pm 0.2) \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone at pH 2.0–6.0 (Hoigné & Bader 1983);

$t_{1/2} = 46 \text{ h}$ in summer, $t_{1/2} = 173 \text{ h}$ in winter in distilled water and $t_{1/2} = 39 \text{ h}$ in summer, $t_{1/2} = 94 \text{ h}$ in winter in estuarine water, based on phototransformation rate when exposed to full sunlight and microbes (Hwang et al. 1986)

$t_{1/2} = 43 \text{ h}$ in summer, $t_{1/2} = 118 \text{ h}$ in winter in poisoned estuarine water, based on photo-transformation rate and $t_{1/2} = 384 \text{ h}$ or 16 d in summer, $t_{1/2} = 2640 \text{ h}$ or 110 d in winter in poisoned estuarine water, based on photomineralization rate (Hwang et al. 1986);

$t_{1/2}$ = 384 h or 16 d in summer, $t_{1/2}$ = 4056 h or 169 d in winter in distilled water; and $t_{1/2}$ = 168 h or 7 d in summer, $t_{1/2}$ = 1752 h or 73 d in winter in estuarine water, based on photo-mineralization rate when exposed to full sunlight and microbes (Hwang et al. 1986);

$t_{1/2}$ = 2000 h in water at pH 8 and $19 \pm 2^\circ\text{C}$ for the reaction with singlet oxygen (Scully & Hoigné 1987); biodegradation $t_{1/2}$ = 11 d in river waters and $t_{1/2}$ = 3 d in Superior harbor waters (Vaishnav & Babeu 1987); complete degradation within 1 d in water from 3 lakes, and degradation is somewhat slower in salt water with $t_{1/2}$ = 9 d in estuary river (Howard 1989);

$t_{1/2}$ = 77 to 3840 h in water, based on reported reaction rate constant for RO_2 radical with the phenols class, $t_{1/2}$ = 5.3 to 56.5 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991); degradation rate constant $k = 0.0217 \text{ d}^{-1}$ corresponding to a $t_{1/2}$ = 766 h in water (quoted from Howard 1989, Guinee & Heijungs 1993)

$t_{1/2}(\text{aerobic}) = 0.25 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 8 \text{ d}$ in natural waters (Capel & Larson 1995)

Groundwater: biodegradation $t_{1/2}$ = 20 d (Vashnav & Babeu 1987);

$t_{1/2}$ = 12 to 168 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Soil: Days for complete disappearance by microbial decomposition in soil suspension: 2 d in Dunkirk silt loam, 1 d in Mardin silt loam (Alexander & Aleem 1961)

degradation in soil completed in 2–5 d even in subsurface soils and $t_{1/2}$ = 2.70 and 3.51 h of low concentration of phenol in 2 silt loam soils (Howard 1989);

$t_{1/2}$ = 24 to 240 h, based on aerobic soil die-away data (Howard et al. 1991);

$t_{1/2}$ = 4.1 d in a slightly basic sandy loam soil containing 3.25% organic matter and $t_{1/2}$ = 23 d in acidic clay soil with < 1.0% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992)

degradation rate constant $k = 0.227 \text{ d}^{-1}$ corresponding to a $t_{1/2}$ = 73.3 h in soil (quoted from Howard 1989, Guinee & Heijungs 1993).

Biota: elimination from goldfish within 4 h (Nagel & Ulrich 1980);

depuration $t_{1/2}(\text{obs}) = 336 \text{ h}$, $t_{1/2}(\text{calc}) = 385 \text{ h}$ for exposure level of $0.0025 \mu\text{g mL}^{-1}$ and $t_{1/2}(\text{obs.}) = 438 \text{ h}$, $t_{1/2}(\text{calc}) = 497 \text{ h}$ for exposure level of $0.0375 \mu\text{g mL}^{-1}$ (Call et al. 1980);

depuration $t_{1/2}(\text{calc}) = 8$ to 44 min in algae (Hardy et al. 1985);

half-lives in fish $t_{1/2} < 1 \text{ d}$ for goldfish, $t_{1/2} = 14$ –18 d for minnow (Niimi 1987)

FIGURE 14.1.1.1.4 Logarithm of K_{OW} versus reciprocal temperature for phenol.

14.1.1.2 *o*-Cresol

Common Name: *o*-Cresol

Synonym: 2-hydroxytoluene, 2-methylphenol, *o*-cresylic acid, *o*-hydroxytoluene, 2-cresol, 1,2-cresol

Chemical Name: 2-methylphenol

CAS Registry No: 95-48-7

Molecular Formula: C_7H_8O , $C_6H_4(CH_3)OH$

Molecular Weight: 108.138

Melting Point ($^{\circ}C$):

31.03 (Lide 2003)

Boiling Point ($^{\circ}C$):

191.04 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0273 (Weast 1982–83)

Acid Dissociation Constant, pK_a :

10.28 (Pearce & Simkins 1968)

10.20 (Hoigné & Bader 1983; Weast 1982–83)

10.26 (Dean 1985)

Molar Volume (cm^3/mol):

104.4 ($30^{\circ}C$, Stephenson & Malanowski 1987)

125.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

46.94 (Biddiscombe & Martin 1958)

45.91 (at normal boiling point, Andon et al. 1960)

42.7 (Dean 1992)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

76.02 (at $25^{\circ}C$, Biddiscombe & Martin 1958; Andon et al. 1960; Dean 1992)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

15.8 (Tsonopoulos & Prausnitz 1971; Riddick et al. 1986)

Entropy of Fusion ΔS_{fus} ($J/mol K$):

52.01 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.873 (mp at $31.03^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

30100* ($35.3^{\circ}C$, shake flask, measured range 35.3 – $162.8^{\circ}C$, critical solution temp $162.8^{\circ}C$, Sidgwick et al. 1915)

24970 (shake flask-residue volume method, Booth & Everson 1948)

25950 (shake flask-UV at pH 5.1, Blackman et al. 1955)

25000* ($20^{\circ}C$, synthetic method/shake flask-optical, measured range 0 – $166.5^{\circ}C$, Ericksen & Dobbert 1955)

25000 (shake flask-UV spectrophotometry, Roberts et al. 1977)

2725 (generator column-HPLC, Wasik et al. 1981)

31000, 56000 ($40^{\circ}C$, $100^{\circ}C$, Verschueren 1983)

42608, 48061, 52241 (75.9 , 88.7 , $98.5^{\circ}C$, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)

26820* (calculated-activity coeff. γ^{∞} data, measured range 25 – $35^{\circ}C$, Dohnal & Fenclová 1995)

26800 (shake flask-HPLC/UV at pH 3.6, Varhaníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

23065* ($142.3^{\circ}C$, mercury manometer, measured range 142.3 – $190.8^{\circ}C$, Goldblum et al. 1947)

- $\log (P/\text{mmHg}) = -2520/(T/K) + 8.308$; temp range 142.3–177.1°C (Hg manometer, Goldblum et al. 1947)
 58.16* (extrapolated-regression of tabulated data, temp range 38–190.5°C, Stull 1947)
 7605* (113.11°C, ebulliometry, measured range 113.11–190.95°C, Dreisbach & Shrader 1949)
 56.72 (calculated-Antoine eq., Dreisbach 1955)
 $\log (P/\text{mmHg}) = 7.49476 - 1777.8/(203.0 + t/^{\circ}\text{C})$; temp range 97–250°C (Antoine eq. for liquid state, Dreisbach 1955)
 38.60 (gas saturation and diaphragm manometer fitted to Antoine eq., Biddiscombe & Martin 1958)
 37.32* (25.25°C, gas saturation -diaphragm manometer, temp range 0–28°C, Biddiscombe & Martin 1958)
 $\log (P/\text{mmHg}) = 12.7778 - 3970.17/(t/^{\circ}\text{C} + 273)$; temp range 0–30°C (Antoine eq. gas-saturation and diaphragm manometer methods, Biddiscombe & Martin. 1958; Andon et al. 1960)
 $\log (P/\text{mmHg}) = 7.07055 - 1542.299/(t/^{\circ}\text{C} + 177.110)$; temp range 110–200°C (Antoine eq. from gas-saturation and diaphragm manometer methods, Biddiscombe & Martin. 1958; Andon et al. 1960)
 $\log (P/\text{mmHg}) = [-0.2185 \times 12487.3/(T/K)] + 8.79055$; temp range 38.2–190.8°C (Antoine eq., Weast 1972–73)
 30.7 (extrapolated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 6.91172 - 1435.503/(165.158 + t/^{\circ}\text{C})$; temp range 120–191°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1973)
 32.0 (Verschueren 1977, 1983)
 38.32 (extrapolated-Cox eq., Chao et al. 1983)
 $\log (P/\text{mmHg}) = [1 - 463.986/(T/K)] \times 10^{\{1.01555 - 9.95980 \times 10^{-4} \cdot (T/K) + 7.92834 \times 10^{-7} \cdot (T/K)^2\}}$; temp range 313.20–697.65 K (Cox eq., Chao et al. 1983)
 30.3, 22.5 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.02377 - 1427.165/(164.218 + t/^{\circ}\text{C})$; temp range 120–191°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 5.82809 - 1299.971/(148.886 + t/^{\circ}\text{C})$; temp range 142.3–189.8°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 30.74 (extrapolated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 6.9117 - 1435.5/(165.16 + t/^{\circ}\text{C})$; temp range 120–191°C (Antoine eq., Dean 1985, 1992)
 37.70 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 11.68858 - 3909.409/(T/K)$; temp range 273–303 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.19545 - 1542.299/(-96.04 + T/K)$; temp range 383–473 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.47616 - 1714.489/(-79.841 + T/K)$; temp range 304–409 K (Antoine eq.-III, liquid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.19561 - 1543.097/(-95.902 + T/K)$; temp range 399–470 K (Antoine eq.-IV, liquid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.24893 - 1584.403/(-90.794 + T/K)$; temp range 463–526 K (Antoine eq.-V, liquid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.82237 - 2134.352/(-19.536 + T/K)$; temp range 517–630 K (Antoine eq.-VI, liquid, Stephenson & Malanowski 1987)
 40.0 (Riddick et al. 1986)
 39.4 (extrapolated-four-parameter vapor pressure eq., Nesterova et al. 1990)
 $\log (P/\text{Pa}) = 99.85294 - 6347.665/(T/K) - 32.60231 \cdot \log (T/K) + 1.24267 \times 10^{-2} \cdot (T/K)$; temp interval of investigation: 412–467 K (four-parameter vapor pressure eq. derived using exptl data of Biddiscombe & Martin 1958, Nesterova et al. 1990)
 $\log (P/\text{mmHg}) = 89.4591 - 6.0489 \times 10^3/(T/K) - 29.481 \cdot \log (T/K) + 1.0936 \times 10^{-4} \cdot (T/K) + 1.9933 \times 10^{-12} \cdot (T/K)^2$; temp range 304–698 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.124, 0.07, 1.082 (exptl., calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 0.284, 0.162 (8, 25°C, calculated, Leuenberger et al. 1985)
 0.0852 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 0.176* (°C, calculated-activity coeff. γ^{∞} data, measured range 25–35°C, Dohnal & Fenclová 1995)

3.352, 5.386, 8.652 (75.9, 88.7, 98.5°C, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)
 0.178 (extrapolated-vapor-liquid equilibrium measurements, Dohnal & Fenclová 1995)
 $\ln K_{AW} = 9.091 - 5556/(T/K)$, temp range 20–100°C (vapor-liquid equilibrium measurements with additional lit. data, Dohnal & Fenclová 1995)
 0.159 (gas stripping-GC, Altschuh et al. 1999)
 0.102 (calculated-group contribution, Lee et al. 2000)
 0.217 (20°C, single equilibrium static technique SEST, Sheikheldin et al. 2001)
 0.0965* (gas stripping-UV, measured range 281–302 K, Harrison et al. 2002)
 $\ln [H/(M \text{ atm}^{-1})] = 6680/(T/K) - 15.4$; temp range 281–302 K, Harrison et al. 2002)
 0.146, 0.239* (20, 25°C, dynamic equilibrium system/gas stripping-GC/MS, Feigenbrugel et al. 2004)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.04 (shake flask-UV, Korenman & Pereshein 1970)
 1.95 (from Hansch & Dunn III unpublished result, Leo et al. 1971; Hansch & Leo 1985)
 1.95 (LC- k' correlation, Carlson et al. 1975)
 2.045 (shake flask, Korenman et al. 1980)
 2.17 (HPLC- k' correlation, Butte et al. 1981; Butte et al. 1987)
 1.96 (generator column-HPLC, Wasik et al. 1981)
 1.99 (RP-HPLC- k' correlation, Miyake & Terada 1982)
 1.98 (recommended, Sangster 1989)
 1.97, 1.98 (COMPUTOX data bank, Kaiser 1993)
 1.95 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

1.26 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1989)
 1.03 (zebrafish, Butte et al. 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

1.34 (Brookstone clay loam soil at pH 5.7, Boyd 1982; quoted, Howard 1989)
 1.26 (calculated-S, Boyd 1982; quoted, Howard 1989)
 1.76 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 3.41 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $300 \pm 1 \text{ K}$ (relative rate method with reference 2-methyl-2-butene Perry et al. 1977; Atkinson et al. 1979)

$k_{NO_3} = (12 \pm 2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $300 \pm 1 \text{ K}$ (relative rate method with reference to with 2-methyl-2-butene Japar & Niki 1975; Graham & Johnston 1978; Carter et al. 1981)

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation with singlet oxygen at 25°C in the aquatic system with half-life > 100 yr (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{OH} = 20 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C with $t_{1/2} = 0.3 \text{ d}$ (Hendry & Kenley 1979; quoted, Mill 1982)

$k_{NO_3} = (13.9 \pm 2.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $300 \pm 1 \text{ K}$ (relative rate method with reference to the reaction of NO_3 radical with 2-methyl-2-butene, Carter et al. 1981; quoted, Atkinson 1991)

photooxidation $t_{1/2} = 66\text{--}3480 \text{ h}$ in water, based on reaction rate constants for OH and RO_2 radicals with the phenol class (Güsten et al. 1981; Mill & Mabey 1985; quoted, Howard et al. 1991)

$k_{O_3} = (2.55 \pm 0.39) \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$; calculated tropospheric lifetimes of 45 d and 0.3 d due to reaction with O_3 and OH radical, respectively, at room temp. (Atkinson et al. 1982, 1984; Atkinson 1985)

$k_{OH} = 2 \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ with half-life of 0.3 d in the atmosphere (Mill 1982)

$k_{OH} = 2.0 \times 10^{13} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 300 K (Lyman et al. 1982)

$k = (1.2 \pm 0.3) \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 1.5–2.0 (Hoigné & Bader 1983b)

$k_{\text{OH}} = 4.1 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 298 K, $k_{\text{NO}_3} = 1 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 300 K (Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)

$k_{\text{NO}_3} = (1.20 \pm 0.34) \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ (Atkinson et al. 1984)

$k_{\text{NO}_3} = (15.6 \pm 1.7) \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ with reference to the reaction of NO_3 radical with *m*-cresol at $(298 \pm 1) \text{ K}$ (Atkinson et al. 1984; quoted, Atkinson 1991)

$k_{\text{NO}_3} = 22 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ with $2.4 \times 10^8 \text{ NO}_3$ radical/ cm^3 at room temp. and a loss rate of 450 d^{-1} with $t_{1/2} = 1.6\text{--}16 \text{ h}$ (Atkinson et al. 1984, 1985; quoted, Atkinson 1985)

$k_{\text{OH}} = 40 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with 5×10^5 hydroxyl radical/ cm^3 at room temp. and a loss rate of 1.7 d^{-1} (Atkinson 1985; quoted, Howard et al. 1991)

$k_{\text{OH}}(\text{exptl}) = 37 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{calc}) = 44.8 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

$k_{\text{OH}}(\text{exptl}) = 40 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = 44 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987; quoted, Sabljic & Güesten 1990; Müller & Klein 1991)

$k_{\text{OH}} = 4.2 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

$k_{\text{NO}_3} = (13.7 \pm 0.9) \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at $(296 \pm 2) \text{ K}$, and $k_{\text{OH}} = 42 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ for at room temp. (Atkinson et al. 1992)

$k_{\text{OH}}(\text{calc}) = 30.36 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

$k_{\text{OH}} = 4.9 \times 10^{-11} \text{ cm}^3 \cdot \text{mol}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{aq.}) = 1.1 \times 10^{-10} \text{ M}^{-1} \text{ s}^{-1}$, the calculated atmospheric lifetime $\tau = 0.24 \text{ d}$ under clear sky; $\tau = 0.22 \text{ d}$ under cloudy conditions at 298 K, reduced to 0.17 d due the average temperature of tropospheric clouds at 283 K (Feigenbrugel et al. 2004)

Hydrolysis:

Biodegradation: 1 to 2 d for bacteria to utilize 95% of 300 ppm in the parent substrate (Tabak et al. 1964)

$t_{1/2} = 2 \text{ d}$ at 20°C and 7 d at 4°C in river water (Ludzack & Ettinger 1960; quoted, Howard 1989)

completely degraded by a soil microflora within one day (Alexander & Lustigman 1966; quoted, Verschueren 1983);

average rate of biodegradation $k = 54.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982)

$t_{1/2}(\text{aq. aerobic}) = 24\text{--}168 \text{ h}$, based on unacclimated aerobic screening test data (Takemoto et al. 1981; Urushigawa et al. 1983; quoted, selected, Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 96\text{--}672 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$k(\text{exptl.}) = 0.0679 \text{ h}^{-1}$ compared to group contribution method predicted $k(\text{calc}) = 0.0728 \text{ h}^{-1}$ (nonlinear) and $k = 0.0567 \text{ h}^{-1}$ (linear) (Tabak & Govind 1993)

$t_{1/2}(\text{aerobic}) = 2 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 15 \text{ d}$ in natural waters (Capel & Larson 1995)

Biotransformation: microbial transformation $k = (2.7 \pm 1.3) \times 10^{-10} \text{ L} \cdot \text{organism}^{-1} \cdot \text{h}^{-1}$ (Paris et al. 1983; quoted, Steen 1991).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 1.6\text{--}16 \text{ h}$ in air, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Atkinson 1985; selected, Howard et al. 1991);

loss rate $k = 10.8 \times 10^{-4} \text{ min}^{-1}$ in outdoor Teflon chambers in the dark (Grosjean 1985);

photodegradation $t_{1/2} \sim 9.6 \text{ h}$ in air, based on measured rate constant for the reaction with photochemically generated hydroxyl radicals (quoted, Howard 1989);

atmospheric transformation lifetime $\tau < 1 \text{ d}$ (estimated, Kelly 1994);

calculated lifetimes of 2.2 h, 2 min and 65 d for reactions with OH radical, NO_3 radical and O_3 , respectively (Atkinson 2000).

calculated atmospheric lifetime $\tau = 0.24 \text{ d}$ under clear sky and $\tau = 0.22 \text{ d}$ under cloudy conditions based on reactions with OH radical in gas and aqueous phases at 298 K, reduced to $\tau = 0.19 \text{ d}$ due to average temperature of tropospheric cloud at 283 K (Feigenbrugel et al. 2004)

Surface water: photooxidation $t_{1/2} = 66\text{--}3480 \text{ h}$ in water, based on reaction rate constants for OH and RO_2 radicals with the phenol class (Güesten et al. 1981; Mill & Mabey 1985; quoted, Howard et al. 1991)

rate constant $k = (1.2 \pm 0.3) \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone at pH 1.5/2.0 (Hoigné & Bader 1983)

$t_{1/2}(\text{aerobic}) = 2 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 15 \text{ d}$ in natural waters (Capel & Larson 1995)

Ground water: estimated $t_{1/2} \sim 0.01 \text{ yr}$ for cresols at Noordwijk (Zoeteman et al. 1981).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2} = 5.1$ d in an acidic clay soil with $< 1.0\%$ organic matter and $t_{1/2} = 1.6$ d in slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).

Biota:

14.1.1.3 *m*-Cresol

Common Name: *m*-Cresol

Synonym: *m*-cresylic acid, 1-hydroxy-3-methylbenzene, 3-hydroxytoluene, *m*-hydroxytoluene, 3-methylphenol, *m*-methylphenol, 3-cresol

Chemical Name: *m*-cresol, 3-methylphenol

CAS Registry No: 108-39-4

Molecular Formula: C_7H_8O , $C_6H_4(CH_3)OH$

Molecular Weight: 108.138

Melting Point ($^{\circ}C$):

12.24 (Lide 2003)

Boiling Point ($^{\circ}C$):

202.27 (Lide 2003)

Density (g/cm^3):

1.0336 (Weast 1982–83)

1.0302 (25 $^{\circ}C$, Riddick et al. 1986)

Acid Dissociation Constant, pK_a :

10.09 (Pearce & Simkins 1968; Riddick et al. 1986; Howard 1989)

10.0 (Hoigné & Bader 1983; Dean 1985)

10.01 (Weast 1982–83)

Molar Volume (cm^3/mol):

105.6 (calculated-density, Rohrschneider 1973)

125.6 (calculated-Le Bas-method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

49.38 (at normal bp, Biddiscombe & Martin 1958)

47.40 (at normal boiling point, Andon et al. 1960)

61.714 (at 25 $^{\circ}C$, Biddiscombe & Martin 1958; Andon et al. 1960; Dean 1992)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

6.53 (Tsonopoulos & Prausnitz 1971)

10.70 (Riddick et al. 1986; Dean 1992)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

37.53 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at 25 $^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F : 1.0

Water Solubility (g/m^3 or mg/L at 25 $^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

23600* (24.7 $^{\circ}C$, shake flask, measured range –2 to 87.58 $^{\circ}C$, critical solution temp 147 $^{\circ}C$, Sidgwick et al. 1915)

22664 (shake flask-residue volume method, Booth & Everson 1948)

22000* (20 $^{\circ}C$, synthetic method/shake flask-optical, measured range 0–148 $^{\circ}C$, Ericksen & Dobbert 1955)

25000 (shake flask-spectrophotometry, Roberts et al. 1977)

2800 (generator column-HPLC, Wasik et al. 1981; Tewari et al. 1982)

23500, 58000 (20 $^{\circ}C$, 100 $^{\circ}C$, Verschueren 1977, 1983)

23790* (20.35 $^{\circ}C$, equilibrium cell-concn ratio-GC, measured range 20.35–139 $^{\circ}C$, Leet et al. 1987)

24125, 23194* (24.7, 25 $^{\circ}C$, calculated-activity coeff. γ^{∞} data, Dohnal & Fenclová 1995)

46935, 54615, 58327 (75.9, 88.7, 98.5 $^{\circ}C$, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)

19600 (shake flask-HPLC/UV at pH 4.45, Varhaníčková et al. 1995)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of the section):

- 20265* (149.5°C, mercury manometer, measured range 149.5–201.1°C, Goldblum et al. 1947)
 $\log(P/\text{mmHg}) = -2650/(T/K) + 8.457$; temp range 149.5–201.1°C (Hg manometer, Goldblum et al. 1947)
- 23.95* (extrapolated-regression of tabulated data, temp range 52–202.8°C, Stull 1947)
- 25.83 (calculated-Antoine eq., Dreisbach 1955)
 $\log(P/\text{mmHg}) = 7.53165 - 1875.3/(201.0 + t/^{\circ}\text{C})$, temp range: 110–240°C, (Antoine eq. for liquid state, Dreisbach 1955)
- 1333* (85.5°C, ebulliometry, measured range 85.5–202.1°C, Vonterres et al. 1955)
- 19.0 (gas saturation-diaphragm manometer fitted to Antoine eq., Biddiscombe & Martin 1958)
- 18.278* (24.90°C, gas saturation-diaphragm manometer, temp range 0–39°C, Biddiscombe & Martin 1958)
 $\log(P/\text{mmHg}) = 9.9653 - 3223.45/(t/^{\circ}\text{C} + 273)$; temp range 11–40°C (Antoine eq. from gas-saturation and diaphragm manometer methods, Biddiscombe & Martin. 1958; Andon et al. 1960)
- $\log(P/\text{mmHg}) = 7.15904 - 1603.811/(t/^{\circ}\text{C} + 172.646)$; temp range 110–200°C (Antoine eq. from gas-saturation and diaphragm manometer methods, Biddiscombe & Martin. 1958; measurements, Andon et al. 1960)
- $\log(P/\text{mmHg}) = [-0.2185 \times 13483.8/(T/K)] + 9.135933$; temp range 52–202.8°C (Antoine eq., Weast 1972–73)
- 22.28 (extrapolated-Antoine eq., Boublik et al. 1973)
 $\log(P/\text{mmHg}) = 7.50798 - 1856.356/(199.065 + t/^{\circ}\text{C})$, temp range 149.5–201°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
- 4120* (114.99°C, diaphragm gauge, measured range 114.99–216.72 °C, Nasir et al. 1980)
- 5.33, 16.0 (20°C, 30°C, Verschuere 1977, 1983)
- 36.43 (calculated-Cox eq., Chao et al. 1983)
 $\log(P/\text{mmHg}) = [1 - 475.222/(T/K)] \times 10^{0.965085 - 6.89845 \times 10^{-4} \cdot (T/K) + 4.47100 \times 10^{-7} \cdot (T/K)^2}$; temp range: 278.05–705.85 K, (Cox eq., Chao et al. 1983)
- 22.1, 11.9 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.62485 - 1850.362/(198.462 + t/^{\circ}\text{C})$; temp range 149.5–201°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
- $\log(P/\text{kPa}) = 6.28411 - 1580.594/(167.548 + t/^{\circ}\text{C})$; temp range 88.5–202.1°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
- 22.29 (extrapolated-Antoine eq., Dean 1985)
 $\log(P/\text{mmHg}) = 7.5080 - 1856.36/(199.07 + t/^{\circ}\text{C})$; temp range 150–201°C (Antoine eq., Dean 1985, 1992)
- 19.10 (Riddick et al. 1986)
- 79960* (466.35 K, vapor-liquid equilibrium, measured range 466.35–588.68 K, Klara et al. 1987)
- 19.08; 18.61 (interpolated-Antoine eq.-III, IV, Stephenson & Malanowski 1987)
 $\log(P_s/\text{kPa}) = 8.0462 - 2930.845/(T/K)$; temp range 273–285 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 6.28394 - 1603.811/(-100.504 + T/K)$; temp range 383–473 K, (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 9.0902 - 3223.45/(T/K)$; temp range 284–313 K (Antoine eq.-III, liquid, Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 7.150 - 2123.548/(-59.018 + T/K)$; temp range 285–416 K (Antoine eq.-IV, liquid, Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 6.28579 - 1605.855/(-100.232 + T/K)$; temp range 410–477 K (Antoine eq.-V, liquid, Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 5.80987 - 1293.277/(-135.465 + T/K)$; temp range 471–531 K (Antoine eq.-VI, liquid, Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 6.64135 - 2069.208/(-26.534 + T/K)$, temp range: 523–633 K, (Antoine eq.-VII, liquid, Stephenson & Malanowski 1987)
- 19.70 (extrapolated-Antoine eq., Nesterova et al. 1990)
 $\log(P/\text{Pa}) = 64.02580 - 5272.296/(T/K) - 18.84252 \cdot \log(T/K) + 0.52858 \times 10^{-2} \cdot (T/K)$; temp range: 409–477 K (four-parameter vapor pressure eq. derived using exptl data of Biddiscombe & Martin 1958, Nesterova et al. 1990)
- $\log(P/\text{mmHg}) = 105.528 - 6.9748 \times 10^3/(T/K) - 35.083 \cdot \log(T/K) + 1.2508 \times 10^{-2} \cdot (T/K) - 2.4317 \times 10^{-12} \cdot (T/K)^2$; temp range 285–706 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.0203, 0.0881 (8, 25°C , calculated, Leuenberger et al. 1985)
 0.0875, 0.0627 (calculated-P/C, estimated-bond contribution, Meylan & Howard 1991)
 0.0718 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 0.1068 (calculated-P/C, Shiu et al. 1994)
 0.0810, 0.0865* (24.7, 25°C , calculated-activity coeff. γ^∞ data, Dohnal & Fenclová 1995)
 1.683, 2.990, 4.635 (75.9, 88.7, 98.5°C , vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)
 0.0848 (extrapolated-vapor liquid equilibrium measurements, Dohnal & Fenclová 1995)
 $\ln K_{\text{AW}} = 8.909 - 5722/(T/\text{K})$, temp range $20\text{--}100^\circ\text{C}$ (vapor-liquid equilibrium measurements with additional lit. data, Dohnal & Fenclová 1995)
 0.0868 (gas stripping-GC, Altschuh et al. 1999)
 0.0641 (20°C , single equilibrium static technique SEST, Sheikheldin et al. 2001)
 0.0765, 0.127* (20, 25°C , dynamic equilibrium system/gas stripping-GC/MS, Feigenbrugel et al. 2004)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 1.96 (shake flask-UV, Fujita et al. 1964; Leo et al. 1971; Hansch & Leo 1985)
 2.02 (shake flask, Korenman et al. 1980)
 1.94 (HPLC-RT correlation, Butte et al. 1981)
 1.96 (generator column-HPLC, Wasik et al. 1981; Tewari et al. 1982)
 1.96 (shake flask-UV, Saarikoski & Viluksela 1982)
 1.98 (recommended, Sangster 1989, 1993)
 1.96 (COMPUTOX databank, Kaiser 1993)
 1.96 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

- 1.30 (golden ide, after 3 d, Freitag et al. 1985)
 3.69 (algae, after 1 d, Freitag et al. 1985)
 3.04 (activated sludge, after 5 d, Freitag et al. 1985)
 1.03 (zebrafish, Butte et al. 1987)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 1.54 (Brookstone clay loam soil, Boyd 1982)
 1.26 (calculated-S, Boyd 1982)
 1.76 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: direct aqueous photolysis $k = 0.011 \pm 0.001 \text{ min}^{-1}$ with $t_{1/2} = 60.4 \text{ min}$ (Stegeman et al. 1993).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{NO}_3} = (7 \pm 1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with reference to the reaction of NO_3 radical with 2-methyl-2-butene (Japar & Niki 1975; Graham & Johnston 1978; Carter et al. 1981)

$k_{\text{OH}} = 48 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with reference to the reaction of OH radical with 2-methyl-2-butene (Atkinson et al. 1979; Carter et al. 1981)

$k_{\text{NO}_3} = (8.10 \pm 1.16) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $(300 \pm 1) \text{ K}$ with reference to the reaction of NO_3 radical with 2-methyl-2-butene (Carter et al. 1981; quoted, Atkinson 1991)

$k_{\text{O}_3} = (1.94 \pm 0.35) \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$; calculated tropospheric lifetimes of 60 d and 0.2 d due to reaction with O_3 and OH radical, respectively, at room temp. (Atkinson et al. 1982, 1984; Atkinson 1985)

photooxidation half-life of 66–3480 h in water, based on reported reaction rate constants for OH and RO_2 radicals with the phenol class (Mill & Mabey 1985; Güesten et al. 1981; selected, Howard et al. 1991)

$k = (1.3 \pm 0.3) \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 1.5/2.0 (Hoigné & Bader 1983b)

$k_{\text{OH}} = 5.92 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)

$k_{\text{NO}_3} = 1 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 K (Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)
 $k_{\text{NO}_3} = (9.20 \pm 2.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ (Atkinson et al. 1984)
 $k_{\text{NO}_3} = (15.9 \pm 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 1 \text{ K}$ with reference to the reaction of NO_3 radical with phenol (Atkinson et al. 1984; quoted, Atkinson 1991)
 $k_{\text{OH}}(\text{calc}) = 93.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $k_{\text{OH}}(\text{exptl}) = 57 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987; quoted, Sabljic & Güesten 1990; Müller & Klein 1991)
 $k_{\text{OH}} = 6.4 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (recommended, Atkinson 1989, 1990)
 $k_{\text{NO}_3} = (9.74 \pm 0.74) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with reference to the reaction of NO_3 radical with 2-methyl-2-butene, and $k_{\text{OH}} = 64 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1992)
 $k_{\text{OH}}(\text{calc}) = 34.42 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)
 $k_{\text{OH}} = 5.2 \times 10^{-11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, the calculated atmospheric lifetime $\tau = 0.22 \text{ d}$ under clear sky; $\tau = 0.19 \text{ d}$ under cloudy conditions at 298 K, reduced to 0.13 d due the average temperature of tropospheric clouds at 283 K (Feigenbrugel et al. 2004)

Hydrolysis:

Biodegradation: $t_{1/2} = 1\text{--}2 \text{ d}$ for bacteria to utilize 95% of 300 ppm in parent substrate (Tabak et al. 1964) completely degraded by a soil microflora within one day (Alexander & Lustigman 1966; quoted, Verschueren 1983)
 average rate $k = 55.0 \text{ mg COD g}^{-1} \cdot \text{h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);
 $t_{1/2}(\text{aq. aerobic}) = 48\text{--}696 \text{ h}$, based on unacclimated marine water grab sample data (Pfaender & Batholomew 1982; selected, Howard et al. 1991);
 $t_{1/2}(\text{aq. anaerobic}) = 360\text{--}1176 \text{ h}$, based on anaerobic screening test data (Horowitz et al. 1982; Shelton & Tiedje 1981; selected, Howard et al. 1991).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 8.0 \text{ h}$, based on rate constant for the gas phase reaction with OH radical in air (Atkinson et al. 1979; quoted, Howard 1989);
 photooxidation $t_{1/2} = 1.1\text{--}11.3 \text{ h}$ in air, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991);
 atmospheric transformation lifetime was estimated to be $< 1 \text{ d}$ (Kelly et al. 1994).
 calculated atmospheric lifetime $\tau = 0.22 \text{ d}$ under clear sky and $\tau = 0.19 \text{ d}$ under cloudy conditions based on reactions with OH radical in gas and aqueous phases at 298 K, reduced to $\tau = 0.13 \text{ d}$ due to average temperature of tropospheric cloud at 283 K (Feigenbrugel et al. 2004)
 Surface water: $t_{1/2} = 48\text{--}696 \text{ h}$, based on unacclimated marine water grab sample data (Pfaender & Batholomew 1982; selected, Howard et al. 1991);
 $k = (1.3 \pm 0.3) \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone at pH 1.5/2.0 (Hoigné & Bader 1983);
 photooxidation $t_{1/2} = 66\text{--}3480 \text{ h}$ in water, based on reported reaction rate constants for OH and RO_2 radicals with the phenol class (Mill & Mabey 1985; Güesten et al. 1981; selected, Howard et al. 1991).
 Ground water: estimated half-life for cresols, $t_{1/2} = 0.01 \text{ yr}$ at Noordwijk (Zoeteman et al. 1981);
 $t_{1/2} = 96\text{--}1176 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life and aqueous anaerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 48\text{--}696 \text{ h}$, based on unacclimated marine water grab sample data (Pfaender & Batholomew 1982; selected, Howard et al. 1991);
 $t_{1/2} = 11.3 \text{ d}$ in an acidic clay soil with $< 1.0\%$ organic matter and $t_{1/2} = 0.6 \text{ d}$ in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).

Reported Henry's law constants of *m*-cresol at various temperatures and temperature dependence equations

$$\ln K_{AW} = A - B/(T/K) \quad (1) \quad \log K_{AW} = A - B/(T/K) \quad (1a)$$

$$\ln (1/K_{AW}) = A - B/(T/K) \quad (2) \quad \log (1/K_{AW}) = A - B/(T/K) \quad (2a)$$

$$\ln (k_H/\text{atm}) = A - B/(T/K) \quad (3)$$

$$\ln H = A - B/(T/K) \quad (4) \quad \log H = A - B/(T/K) \quad (4a)$$

$$K_{AW} = A - B \cdot (T/K) + C \cdot (T/K)^2 \quad (5)$$

FIGURE 14.1.1.3.3 Logarithm of Henry's law constant versus reciprocal temperature for *m*-cresol.

14.1.1.4 *p*-Cresol

Common Name: *p*-Cresol

Synonym: *p*-cresylic acid, 1-hydroxy-4-methylbenzene, 4-hydroxytoluene, 4-methylphenol, *p*-hydroxytoluene, *p*-methylphenol, 4-cresol

Chemical Name: 4-methylphenol

CAS Registry No: 106-44-5

Molecular Formula: C_7H_8O , $CH_3C_6H_4OH$

Molecular Weight: 108.138

Melting Point ($^{\circ}C$):

34.77 (Lide 2003)

Boiling Point ($^{\circ}C$):

201.98 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0178 (Weast 1982–83)

Acid Dissociation Constant, pK_a :

10.26 (Pearce & Simkins 1968, Dean 1985, Riddick et al. 1986; Howard 1989)

10.28 (Serjeant & Dempsey 1979; Tratnyek & Hoigné 1991; Haderlein & Schwarzenbach 1993)

10.17 (Weast 1982–83)

Molar Volume (cm^3/mol):

125.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

49.53 (at normal bp, Biddiscombe & Martin 1958)

47.55 (at normal boiling point, Andon et al. 1960)

43.2 (Dean 1992)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

73.93 (at $25^{\circ}C$, Biddiscombe & Martin 1958; Andon et al. 1960; Dean 1992)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

12.72 (Tsonopoulos & Prausnitz 1971; Dean 1992)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

53.22 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.802 (mp at $34.77^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

22400* ($40.2^{\circ}C$, shake flask, measured range 40.2 – $143.5^{\circ}C$, critical solution temp $143.5^{\circ}C$, Sidgwaick et al. 1915)

24230 (shake flask-residue volume method, Booth & Everson 1948)

19000 (shake -flask-UV, Blackman et al. 1955)

17000* ($20^{\circ}C$, synthetic method/shake flask-optical, measured range 0 – $143.7^{\circ}C$, Ericksen & Dobbert 1955)

21000 (shake flask-spectrophotometry, Roberts et al. 1977)

24000, 53000 ($40^{\circ}C$, $100^{\circ}C$, Verschueren 1977, 1983)

21500* (calculated-activity coeff. γ^{∞} data, Dohnal & Fenclová 1995)

43534, 50064, 54615 (75.9 , 88.7 , $98.5^{\circ}C$, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)

22000 (shake flask-HPLC/UV at pH 3.9, Varhaníčkova et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

17599* ($145.7^{\circ}C$, mercury manometer, measured range 145.7 – $200.8^{\circ}C$, Goldblum et al. 1947)

- $\log (P/\text{mmHg}) = -2680/(T/K) + 8.524$; temp range 145.7–200.9°C (Hg manometer, Goldblum et al. 1947)
 21.89* (extrapolated-regression of tabulated data, temp range 53–201.8°C, Stull 1947)
 7605* (128.65 °C, ebulliometry, measured range 128.65–201.88 °C, Dreisbach & Shrader 1949)
 26.34 (calculated-Antoine eq., Dreisbach 1955)
 $\log (P/\text{mmHg}) = 7.52971 - 1872.4/(201.0 + t/^{\circ}\text{C})$; temp range 97–250°C (Antoine eq. for liquid state, Dreisbach 1955)
 15.91 (gas saturation-diaphragm manometer fitted to Antoine eq., Biddiscombe & Martin 1958)
 12.93* (23.35°C, gas saturation-diaphragm manometer, measured range 0–34.15°C, Biddiscombe & Martin 1958)
 $\log (P/\text{mmHg}) = 12.0298 - 3861.98/(t/^{\circ}\text{C} + 273)$; temp range 0–34°C (Antoine eq. from gas-saturation and diaphragm manometer methods, Biddiscombe & Martin. 1958; Andon et al. 1960)
 $\log (P/\text{mmHg}) = 7.11767 - 1566.029/(t/^{\circ}\text{C} + 167.680)$; temp range 110–200°C (Antoine eq. from gas-saturation-diaphragm manometer methods, Biddiscombe & Martin. 1958; Andon et al. 1960)
 133.3 (53°C, Andon et al. 1960; Haque et al. 1980)
 $\log (P/\text{mmHg}) = [-0.2185 \times 13611.7/(T/K)] + 9.190555$; temp range 53–201.8°C (Antoine eq., Weast 1972–73)
 11.8 (extrapolated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 7.03508 - 1511.08/(161.854 + t/^{\circ}\text{C})$; temp range 128–210.88°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1973)
 13.94 (extrapolated-Cox eq., Chao et al. 1983)
 $\log (P/\text{mmHg}) = [1 - 475.109/(T/K)] \times 10^{\{1.07944 - 11.6938 \times 10^{-4} \cdot (T/K) + 9.28202 \times 10^{-7} \cdot (T/K)^2\}}$; temp range: 323.20–704.65 K, (Cox eq., Chao et al. 1983)
 11.8, 17.5 (calculated-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.15637 - 1508.694/(161.594 + t/^{\circ}\text{C})$, temp range 128–201.9°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.44531 - 1713.242/(183.846 + t/^{\circ}\text{C})$; temp range 15.7–200.9°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 11.83 (extrapolated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 7.03508 - 1511.08/(161.85 + t/^{\circ}\text{C})$; temp range 128–202°C (Antoine eq., Dean 1985, 1992)
 17.3 (Riddick et al. 1986)
 15.6 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 12.098 - 3861.98/(T/K)$; temp range 273–307 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 11.16859 - 3868.314/(T/K)$; temp range 277–307 K (Antoine eq.-II, solid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.24257 - 1566.029/(-105.47 + T/K)$; temp range 383–473 K (Antoine eq.-III, liquid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.83697 - 1930.688/(-73.422 + T/K)$; temp range 308–393 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 5.2376 - 1563.08/(-105.776 + T/K)$; temp range 385–477 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.19164 - 1533.535/(-108.781 + T/K)$; temp range 463–533 K (Antoine eq.-VI, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.99685 - 2310.405/(-10.362 + T/K)$; temp range 523–635 K (Antoine eq.-VII, Stephenson & Malanowski 1987)
 16.1 (extrapolated-Antoine eq., Nesterova et al. 1990)
 $\log (P/\text{Pa}) = 93.42570 - 6409.054/(T/K) - 29.82622 \cdot \log (T/K) + 1.03314 \times 10^{-2} \cdot (T/K)$; temp range: 397–476 K (four-parameter vapor pressure eq. derived using exptl data of Biddiscombe & Martin 1958, Nesterova et al. 1990)
 $\log (P/\text{mmHg}) = 122.8998 - 7.6175 \times 10^3/(T/K) - 41.637 \cdot \log (T/K) + 1.5709 \times 10^{-2} \cdot (T/K) - 8.9199 \times 10^{-13} \cdot (T/K)^2$; temp range 308–705 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.0802; 0.0699; 1.0820 (exptl., calculated-group contribution; calculated-bond contribution Hine & Mookerjee 1975)

0.0223, 0.0973 (8, 25°C, calculated, Leuenberger et al. 1985)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.94 (shake flask-UV, Fujita et al. 1964)
 1.92, 1.94, 1.95 (quoted literature values, Leo et al. 1971; Hansch & Leo 1979, Hansch & Leo 1985)
 1.99 (shake flask-UV at pH 7.45, Umeyama et al. 1971)
 1.94 (LC- k' correlation, Carlson et al. 1975)
 2.17 (shake flask, Korenman et al. 1980)
 1.97 (RP-HPLC- k' correlation, Miyake & Terada 1982)
 1.92, 1.98 ± 0.07 (selected best lit. value, exptl.-ALPM, Garst & Wilson 1984)
 1.62 (HPLC- k' correlation, Haky & Young 1984)
 1.73 (calculated-activity coeff. γ from UNIFAC, Campbell & Luthy 1985)
 1.91 (HPLC- k' correlation, Miyake et al. 1987)
 1.94 (RP-HPLC-capacity ratio, Minick et al. 1988)
 1.94 (recommended, Hansch et al. 1995)
 1.90; 2.06, 2.12, 1.94 (solid-phase microextraction; calculated- K_{OW} program, calculated-CLOGP, quoted exptl., Dean et al. 1996)
 1.53, 1.53, 1.69, 1.76 (HPLC- k' correlation, different combinations of stationary and mobile phases under isocratic conditions, Makovskaya et al. 1995a)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

1.26 (estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1989)

Sorption Partition Coefficient, $\log K_{OC}$:

2.81 (Coyote Creek sediment, Smith et al. 1978)
 1.69 (Brookstone clayloam soil, Boyd 1982)
 -0.046 (predicted-S, Boyd 1982)
 1.76 (calculated- K_{OW} , Kollig 1993)
 2.70 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 2.15, 2.33 (soils: organic carbon $OC \geq 0.1\%$ and pH 2.0–7.4, $OC \geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} \sim 167$ d, estimated from a lake as calculated from equations of Mackay & Wolkoff 1973 (Smith et al. 1978).

Photolysis:

$k = 6.8 \times 10^{-7} \text{ s}^{-1}$ under overcast weather of April at 25°C; $t_{1/2} \sim 4800$ h in river, $t_{1/2} > 10000$ h in both eutrophic lake and pond and $t_{1/2} = 2400$ h in oligotrophic lake, based on an average photolysis rate on a summer day at 40°N latitude by the one compartment model (Smith et al. 1978; quoted, Howard 1989)
 photolytic $t_{1/2} = 5800$ h in aquatics (Haque et al. 1980).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 144\text{--}11325$ h in water, based on measured rate data for reactions with singlet oxygen and hydroxyl radical in aqueous solution (Anbar & Neta 1967; Scully & Hoigne 1987; quoted, Howard et al. 1991)

$k_{\text{NO}_3} = (13 \pm 2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 ± 1 K (Japar & Niki 1975; Graham & Johnston 1978; quoted, Carter et al. 1981)

$k(\text{aq.}) = 20 \text{ M}^{-1} \text{ s}^{-1}$, averaged over 24-h day (Smith et al. 1978)

$k_{\text{OH}} = 38 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 ± 1 K (Atkinson et al. 1979; quoted, Carter et al. 1981)

photooxidation $t_{1/2} = 10$ h, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Atkinson et al. 1979; quoted, Howard 1989)

$k_{\text{NO}_3} = (15 \pm 2.4) \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 300 ± 1 K in air (relative rate technique with reference to 2-methyl-2-butene, Carter et al. 1981; quoted, Atkinson 1991)

$k_{\text{O}_3} = (4.71 \pm 0.66) \times 10^{-19} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K; calculated tropospheric lifetimes of 25 d and 0.3 d due to reaction with O_3 and OH radical, respectively, at room temp. (Atkinson et al. 1982, 1984; Atkinson 1985)

$k = (3.0 \pm 0.6) \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 1.5/2.0 (Hoigné & Bader 1983b)

$k_{\text{OH}} = 4.50 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)

$k_{\text{NO}_3} = 1 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 K (Atkinson & Lloyd 1984; quoted, Carlier et al. 1986)

$k_{\text{OH}} = (16.6 \pm 1.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 ± 1 K (relative technique with reference to *m*-cresol, Atkinson et al. 1984; quoted, Atkinson 1991)

$k_{\text{NO}_3} = (1.27 \pm 0.36) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K in air (Atkinson et al. 1984)

photooxidation $t_{1/2} = 1.5\text{--}15$ h, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Atkinson 1985; selected, Howard et al. 1991)

$k_{\text{OH}}(\text{exptl}) = 44.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{obs.}) = 41 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

$k_{\text{OH}}(\text{calc}) = 56.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{exptl}) = 42 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1985; quoted, Sabljic & Güesten 1990; Müller & Klein 1991)

$k_{\text{OH}}(\text{calc}) = 44 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{exptl}) = 44 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987; quoted, Sabljic & Güesten 1990)

$k = 1.1 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 8.3, $2.4 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 8.8, $1.6 \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ at pH 10, $3.5 \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ at pH 11.5 for the reaction with singlet oxygen in water at $(19 \pm 2)^\circ\text{C}$ (Scully & Hoigné 1987)

$k_{\text{NO}_3} = 21.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson et al. 1988; quoted, Sabljic & Güesten 1990; Müller & Klein 1991)

$k_{\text{OH}} = 4.7 \times 10^{-1} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

$k = (9.6 \pm 2.8) \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen in aqueous phosphate buffer at $(27 \pm 1)^\circ\text{C}$ (Tratnyek & Hoigné 1991)

$k_{\text{NO}_3} = (10.7 \pm 1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K, $k_{\text{OH}} = 47 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1992)

$k_{\text{OH}}(\text{calc}) = 30.83 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

$k_{\text{OH}} = 5.2 \times 10^{-11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{aq.}) = 1.2 \times 10^{-10} \text{ M}^{-1} \text{ s}^{-1}$, the calculated atmospheric lifetime $\tau = 0.23$ d under clear sky; $\tau = 0.18$ d under cloudy conditions at 298 K, reduced to 0.11 d due to the average temperature of tropospheric clouds at 283 K (Feigenbrugel et al. 2004)

Hydrolysis: no hydrolyzable functional groups (Smith et al. 1978).

Biodegradation: $t_{1/2} = 1\text{--}2$ d for bacteria to utilize 95% of 300 ppm in parent substrate (Tabak et al. 1964)

Completely degraded by a soil microflora in one day (Alexander & Lustigman 1966; quoted, Verschueren 1983);

average rate $k = 55.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

$t_{1/2} = 12$ h in eutrophic lake for a point source continuously discharging $1.0 \mu\text{g/mL}$ predicted by one compartment model for all processes including dilution (Smith et al. 1978); laboratory determined $k = 5.2 \times 10^{-7} \text{ mL cell}^{-1} \text{ h}^{-1}$ at 25°C (Smith et al. 1978)

$k(\text{calc}) = 1.7 \text{ d}^{-1}$ in river water, $k = 0.8\text{--}4.7 \text{ d}^{-1}$ in estuary water and $k = 2.8\text{--}4.8 \text{ d}^{-1}$ in marine water after a lag period (Vashon & Schwab 1982; quoted, Battersby 1990);

$t_{1/2}(\text{aq. aerobic}) = 1\text{--}16$ h, based on unacclimated marine and freshwater grab sample data (Van Veld & Spain 1983; Rogers et al. 1984; selected, Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 240\text{--}672$ h, based on anaerobic screening test data (Boyd et al. 1983; Horowitz et al. 1982; selected, Howard et al. 1991);

$k = 1.72 \times 10^{-17}$ mol cell⁻¹ h⁻¹ in pure culture system (Banerjee et al. 1984).

Biotransformation: estimated $t_{1/2} = 12$ h in river, eutrophic lake and pond and $t_{1/2} > 10000$ h in oligotrophic lake, based on an average photolysis rate on a summer day at 40°N latitude by the one compartment model (Smith et al. 1978).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 10$ h, based on measured rate data for the vapor phase reaction with OH radical in air (Atkinson et al. 1979; quoted, Howard 1989);

photooxidation $t_{1/2} = 1.5\text{--}15$ h, based on measured rate data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be < 1 d (Kelly et al. 1994).

calculated atmospheric lifetime $\tau = 0.23$ d under clear sky and $\tau = 0.18$ d under cloudy conditions based on reactions with OH radical in gas and aqueous phases at 298 K, reduced to $\tau = 0.11$ d due to average temperature of tropospheric cloud at 283 K (Feigenbrugel et al. 2004)

Surface water: $t_{1/2} = 0.55$ h in river, $t_{1/2} = 12$ h in pond and eutrophic lake, and $t_{1/2} = 2400$ h in oligotrophic lake for a point source continuously discharging 1.0 µg/mL predicted by one compartment model for all processes including dilution (Smith et al. 1978; quoted, Howard 1989);

rate constant $k = (3.0 \pm 0.6) \times 10^4$ M⁻¹·s⁻¹ for the reaction with ozone at pH 1.5/2.0 in water (Hoigné & Bader 1983b);

$t_{1/2} = 1\text{--}16$ h, based on unacclimated marine and freshwater grab sample data (Van Veld & Spain 1983; Rogers et al. 1984; quoted, Howard et al. 1991);

$t_{1/2} = 500$ h for the reaction with singlet oxygen in water at pH 8 and $(19 \pm 2)^\circ\text{C}$ (Scully & Hoigné 1987).

Ground water: estimated half-life for cresols, $t_{1/2} = 0.01$ yr at Noordwijk (Zoeteman et al. 1981); $t_{1/2} = 2\text{--}672$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life and aqueous anaerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil:

$t_{1/2} = 1\text{--}16$ h, based on unacclimated marine and freshwater grab sample data (Van Veld & Spain 1983; Rogers et al. 1984; quoted, Howard et al. 1991);

$t_{1/2} = 0.5$ d in an acidic clay soil with $< 1.0\%$ organic matter and $t_{1/2} = 1.0$ d in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).

14.1.1.5 2,3-Dimethylphenol

Common Name: 2,3-Dimethylphenol

Synonym: 2,3-xylenol, 1-hydroxy-2,3-dimethylbenzene

Chemical Name: 2,3-dimethylphenol

CAS Registry No: 526-75-0

Molecular Formula: $C_8H_{10}O$, $CH_3C_6H_3(CH_3)OH$

Molecular Weight: 122.164

Melting Point ($^{\circ}C$):

72.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

216.9 (Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

10.54 (Dohnal & Fenclová 1995)

Molar Volume (cm^3/mol):

147.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

84.08, 47.32 ($25^{\circ}C$, normal boiling point, Andon et al. 1960)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, F : 0.342 (mp at $72.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

40000* ($150^{\circ}C$, shake flask-optical method, measured range 150 – $208.8^{\circ}C$, Erichsen & Dobbert 1955)

3930 ($20^{\circ}C$, shake flask or batch contacting technique-UV, Dohnal & Fenclová 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

133.3* ($56^{\circ}C$, summary of literature data, temp range 56 – $219.0^{\circ}C$, Stull 1947)

1333* ($84.0^{\circ}C$, ebulliometry, measured range 84.0 – $219.0^{\circ}C$, Vonterres et al. 1955)

3.64* ($24.71^{\circ}C$, ebulliometry/gas saturation, measured range 10 – $45^{\circ}C$, Andon et al. 1960)

$\log(P/mmHg) = 13.1606 - 4389.99/(t/^{\circ}C + 273)$; temp range 10 – $50^{\circ}C$ (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)

$\log(P/mmHg) = 7.04268 - 1069.164/(t/^{\circ}C + 169.744)$; temp range 149 – $219^{\circ}C$ (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)

$\log(P/kPa) = 6.13887 - 1588.200/(167.385 + t/^{\circ}C)$; temp range 149 – $218^{\circ}C$ (Antoine eq. derived from experimental data of Andon et al. 1960, Boublik et al. 1984)

$\log(P/kPa) = 6.01592 - 1644.433/(192.286 + t/^{\circ}C)$, temp range 84 – $219^{\circ}C$ (Antoine eq. derived from experimental data of Vonterres et al. 1955, Boublik et al. 1984)

$\log(P_s/kPa) = 12.29616 - 4394.694/(T/K)$; temp range 282 – $323 K$ (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.17998 - 1619.086/(-102.197 + T/K)$; temp range 433 – $492 K$ (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P/mmHg) = 82.92733 - 6.0367 \times 10^3/(T/K) - 26.948 \cdot \log(T/K) + 9.739 \times 10^{-3} \cdot (T/K) + 2.5196 \times 10^{-12} \cdot (T/K)^2$; temp range 346 – $723 K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0631, 0.0952 (20 , $25^{\circ}C$, calculated-limiting activity coefficient γ^{∞} data, Dohnal & Fenclová 1995)

2.96, 5.656, 8.652 (75.9, 88.7, 98.5°C, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)

$\ln K_{AW} = 11.858 - 6567/(T/K)$; temp range 20–98.5°C (vapor-liquid equilibrium VLE data, Dohnal & Fenclová 1995)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.48 (HPLC-RT correlation, Makovskaya et al. 1995b)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$, or Lifetimes, τ :

Half-Lives in the Environment:

Synonym: 2,4-xylenol, *as-m*-xylenol, 1-hydroxy-2,4-dimethylbenzene

Chemical Name: 2,4-dimethylphenol

CAS Registry No: 105-67-9

Molecular Formula: $C_8H_{10}O$, $CH_3C_6H_3(CH_3)OH$

Molecular Weight: 122.164

Melting Point ($^{\circ}C$):

24.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

210.98 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0202 (Andon et al. 1960)

0.9650 (Weast 1982–83)

Molar Volume (cm^3/mol):

147.8 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

10.60 (Herington & Kynaston 1957; quoted, Callahan et al. 1979)

10.58 (Dean 1985)

10.63 (Riddick et al. 1986; Howard 1989)

10.10 (Kollig 1993)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

47.15 (at normal boiling point, Andon et al. 1960)

65.86 (at $25^{\circ}C$, Andon et al. 1960; Dean 1992)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

8795 (shake flask-UV at pH 5.1, Blackman et al. 1955)

6200 (shake flask-UV at pH 6.5, Blackman et al. 1955)

6200* (synthetic method/shake flask-optical, extrapolated value, measured range 160 – $213.5^{\circ}C$, Ericksen & Dobbert 1955)

7868 (shake flask-LSC, Banerjee et al. 1980)

7888 (shake flask-radioactive analysis, Veith et al. 1980)

7819 (generator column-HPLC, Wasik et al. 1981)

4200 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)

7929 (calculated-activity coeff. γ^{∞} data, Dohnal & Fenclová 1995)

8200 (shake flask-HPLC/UV, Varhaníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($51.8^{\circ}C$, summary of literature data, temp range 51.8 – $211.0^{\circ}C$, Stull 1947)

21.78 (calculated-Antoine eq., Dreisbach 1955)

$\log (P/mmHg) = 7.37688 - 1838.9/(1999.0 + t/^{\circ}C)$; temp range 115 – $245^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

- 1333* (89.50 °C, ebulliometry, measured range 89.50–211.0 °C, Vonterres et al. 1955)
 12.81* (24.87°C, ebulliometric and gas-saturation methods, measured range 9–45°C Andon et al. 1960)
 13.02 (interpolated-Antoine eq. derived from exptl. results, Andon et al. 1960)
 $\log (P/\text{mmHg}) = 10.5277 - 3439.99/(t/^{\circ}\text{C} + 273)$; temp range 9–45°C (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)
 $\log (P/\text{mmHg}) = 7.04694 - 1581.391/(t/^{\circ}\text{C} + 168.652)$; temp range 114–212°C (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)
 $\log (P/\text{mmHg}) = [-0.2185 \times 13130.2/(T/K)] + 8.867260$; temp range 51.8–211.5°C (Antoine eq., Weast 1972–73)
 10.28 (extrapolated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 7.05539 - 1587.459/(169.339 + t/^{\circ}\text{C})$; temp range 144.4–212.3°C (Antoine eq. from reported exptl. data of Andon et al. 1960, Boublik et al. 1973)
 13.17 (calculated-Cox eq., Chao et al. 1983)
 $\log (P/\text{mmHg}) = [1 - 483.876/(T/K)] \times 10^{\{0.999891 - 8.94506 \times 10^{-4} \cdot (T/K) + 6.96026 \times 10^{-7} \cdot (T/K)^2\}}$; temp range: 298.02–707.95 K, (Cox eq., Chao et al. 1983)
 10.29, 20.22 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.18152 - 1588.34/(169.437 + t/^{\circ}\text{C})$, temp range 144.4–212.3°C (Antoine eq. from reported exptl. data of Andon et al. 1960, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 7.02271 - 2183.475/(225.488 + t/^{\circ}\text{C})$; temp range 89.5–211°C (Antoine eq. from reported exptl. data of Vonterres et al. 1955, Boublik et al. 1984)
 10.28 (extrapolated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 7.05539 - 1587.46/(169.34 + t/^{\circ}\text{C})$; temp range 144–212°C (Antoine eq., Dean 1985, 1992)
 12.87 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 9.65613 - 3442.574/(T/K)$; temp range 282–318 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.1672 - 1578.685/(-104.772 + T/K)$; temp range 429–486 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 12.96 (extrapolated-four-parameter vapor pressure eq., Nesterova et al. 1990)
 $\log (P/\text{Pa}) = 86.11491 - 6138.775/(T/K) - 27.12977 \cdot \log (T/K) + 0.91169 \times 10^{-2} \cdot (T/K)$; temp range 418–485 K (four-parameter vapor pressure eq. derived using exptl data of Andon et al. 1960, Nesterova et al. 1990)
 $\log (P/\text{mmHg}) = 53.3866 - 5.1516 \times 10^3/(T/K) - 15.095 \cdot \log (T/K) - 1.3196 \times 10^{-9} \cdot (T/K) + 2.8455 \times 10^{-6} \cdot (T/K)^2$; temp range 346–708 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 1.722 (calculate-P/C, Mabey et al. 1982)
 500 (EPICS-GC, Ashworth et al. 1988)
 500* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm m}^3/\text{mol})] = -16.34 - 3307/(T/K)$, temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 0.0638 (8°C, Leuenberger et al. 1985)
 0.203, 0.0692 (calculated-P/C, estimated-bond contribution, Meylan & Howard 1991)
 0.1815 (calculated-P/C, Shiu et al. 1994)
 0.199* (calculated-limiting activity coeff. γ^{∞} data, Dohnal & Fenclová 1995)
 4.338, 7.491, 11.46 (75.9, 88.7, 98.5°C, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)
 0.202* (extrapolated-vapor liquid equilibrium measurements, Dohnal & Fenclová 1995)
 $\ln K_{AW} = 10.077 - 5811/(T/K)$; temp range 20–100°C (vapor-liquid equilibrium measurements with additional lit. data, Dohnal & Fenclová 1995)
 0.154 (20°C, single equilibrium static technique SEST, Sheikheldin et al. 2001)
 643 (20°C, selected from literature experimentally measured data - poor correlation coefficient, Staudinger & Roberts 2001)
 $\log K_{AW} = -5.192 + 1563/(T/K)$; poor correlation coefficient (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 2.30 (20°C, shake flask-UV, Korenman 1973)
 2.42 (23 ± 1.5°C, shake flask-LSC, Banerjee et al. 1980; Veith et al. 1980)

- 2.30 (shake flask, Korenman et al. 1980)
- 1.99, 2.54 (RP-HPLC-RT correlation, quoted calculated value, Veith et al. 1980)
- 2.54 (35°C, shake flask-UV, Rogers & Wong 1980)
- 2.34 (generator column-HPLC, Wasik et al. 1981)
- 2.37 (calculated-activity coeff. γ from UNIFAC not considering mutual solubility of octanol and water, Arbuckle 1983)
- 2.95 (calculated-activity coeff. γ from UNIFAC by considering mutual solubility of octanol and water, Arbuckle 1983)
- 2.14 (HPLC- k' correlation, Haky & Young 1984)
- 1.83 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
- 2.35 (recommended, Sangster 1989, 1993)
- 2.48 (calculated-UNIFAC activity coeff., Dallos et al. 1993)
- 2.30 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 1.18 (bluegill sunfish, Barrows et al. 1980)
- 2.18 (bluegill sunfish, Veith et al. 1980)
- 1.86 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
- 1.88 (calculated-MCI χ , Sabljic 1987a)

Sorption Partition Coefficient, $\log K_{OC}$:

- 1.98 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
- 2.63 (soil, calculated- K_{OW} , Lyman et al. 1982)
- 2.19 (activated carbon, Blum et al. 1994)
- 1.76 (calculated- K_{OW} , Kollig 1993)
- 2.62, 2.77 (average values for sediments, soils, Delle Site 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k < 4 \times 10^6 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen, $1.1 \times 10^8 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)
 photooxidation $t_{1/2} = 77\text{--}3840 \text{ h}$ in water, based on reported reaction rate constants for RO_2 radicals with the phenol class (Mill & Mabey 1985; selected, Howard et al. 1991)

photooxidation $t_{1/2} = 8.0 \text{ h}$ in air, based on reaction with photochemically produced hydroxyl radical in air (GEMS 1986; selected, Howard 1989)

$k_{OH} = 71.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ (Atkinson 1989)

photooxidation $t_{1/2} = 1.19\text{--}11.9 \text{ h}$, based on estimated rate constant for the reaction with OH radical in air (Howard et al. 1991)

$k_{OH}(\text{calc}) = 51.06 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

$k_{OH}(\text{calc}) = 5.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{exptl}) = 1.06 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (SAR structure-activity relationship, Kwok & Atkinson 1995)

Hydrolysis:

Biodegradation: average rate of biodegradation $28.2 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982); first-order rate constant $k = 1.0 \text{ d}^{-1}$ corresponding to $t_{1/2} = 0.7 \text{ d}$ in adapted activated sludge under aerobic conditions (Mills et al. 1982);

$t_{1/2}(\text{aq. aerobic}) = 24\text{--}168 \text{ h}$, based on aqueous aerobic screening test data (Petrasek et al. 1983; Chambers et al. 1963; selected, Howard et al. 1991); $t_{1/2}(\text{aq. anaerobic}) = 96\text{--}672 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

average $k(\text{exptl.}) = 0.0578 \text{ h}^{-1}$ compared to group contribution method predicted $k = 0.0758 \text{ h}^{-1}$ (nonlinear) and $k = 0.0646 \text{ h}^{-1}$ (linear) (Tabak & Govind 1993).

Biotransformation: rate constant for bacterial transformation of 1×10^7 mL cell⁻¹ h⁻¹ in water (Mabey et al. 1982).
 Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 8.0$ h, based on reaction with photochemically produced hydroxyl radical in air (GEMS 1986; quoted, Howard 1989); photooxidation $t_{1/2} = 1.19$ – 11.9 h, based on estimated rate constant for the reaction with hydroxyl radicals in air (Howard et al. 1991).

Surface water: photooxidation $t_{1/2} = 77$ – 3840 h in water, based on reported reaction rate constants for RO₂ radical with the phenol class (Mill & Mabey 1985; quoted, Howard et al. 1991).

Groundwater: $t_{1/2} = 48$ – 336 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).
 Sediment:

Soil: $t_{1/2} = 24$ – 168 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

TABLE 14.1.1.6.1

Reported aqueous solubilities and Henry's law constants of 2,4-dimethylphenol at various temperatures

(Continued)

14.1.1.7 2,5-Dimethylphenol

Common Name: 2,5-Dimethylphenol

Synonym: 2,5-xylenol, 1-hydroxy-2,5-dimethylbenzene

Chemical Name: 2,5-dimethyl phenol

CAS Registry No: 95-87-4

Molecular Formula: $C_8H_{10}O$, $CH_3C_6H_3(CH_3)OH$

Molecular Weight: 122.164

Melting Point ($^{\circ}C$):

74.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

211.1 (Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

10.41 (Dohnal & Fenclová 1995)

Molar Volume (cm^3/mol):

147.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

84.98, 46.94 ($25^{\circ}C$, normal bp, Andon et al. 1960)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.325 (mp at $74.8^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

3126 (shake flask-UV, pH 5.1, Blackman et al. 1955)

3122 ($20^{\circ}C$, shake flask-UV, Dohnal & Fenclová 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($51.8^{\circ}C$, summary of literature data, temp range 51.8 – $211.5^{\circ}C$, Stull 1947)

1333* ($89.40^{\circ}C$, ebulliometry, measured range 89.40 – $211.2^{\circ}C$, Vonterres et al. 1955)

1.213* ($24.82^{\circ}C$, ebulliometry/gas saturation, measured range 9.5 – $45^{\circ}C$, Andon et al. 1960)

$\log(P/mmHg) = 13.3705 - 4438.56/(t/^{\circ}C + 273)$; temp range 9 – $50^{\circ}C$ (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)

$\log(P/mmHg) = 7.03684 - 1581.906/(t/^{\circ}C + 169.497)$; temp range 143 – $212^{\circ}C$ (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)

$\log(P/kPa) = 6.1332 - 1560.465/(176.024 + t/^{\circ}C)$, temp range 144 – $211.2^{\circ}C$ (Antoine eq. derived from exptl data of Andon et al. 1960, Boublik et al. 1984)

$\log(P/kPa) = 6.04303 - 1383.881/(157.333 + t/^{\circ}C)$; temp range 89.4 – $211.2^{\circ}C$ (Antoine eq. derived from exptl data of Vonterres et al. 1955, Boublik et al. 1984)

$\log(P_s/kPa) = 12.51064 - 3950.681/(T/K)$, temp range 282 – $323 K$ (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.17702 - 1593.804/(-102.241 + T/K)$; temp range 427 – $485 K$ (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P/mmHg) = 47.5888 - 4.8102 \times 10^3/(T/K) - 13.186 \cdot \log(T/K) - 1.0208 \times 10^{-9} \cdot (T/K) + 2.7045 \times 10^{-12} \cdot (T/K)^2$; temp range 348 – $707 K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.0873, 0.133 (20, 25°C, calculated-limiting activity coefficient γ^∞ data, Dohnal & Fenclová 1995)

4.353, 7.476, 11.20 (75.9, 88.7, 98.5°C, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)

$\ln K_{AW} = 12.004 - 6511/(T/K)$; temp range 20–98.5°C (vapor-liquid equilibrium VLE data, Dohnal & Fenclová 1995)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.34 (shake flask, Korenman 1973)

2.33 (shake flask, Korenman et al. 1980)

2.35 (generator column-HPLC, Wasik et al. 1981)

2.34 (recommended, Sangster 1993)

2.48 (HPLC-RT correlation, Makovskaya et al. 1995b)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

TABLE 14.1.1.7.1

Reported vapor pressures of 2,5-dimethylphenol at various temperatures and the coefficients for the vapor pressure equations

$\log P = A - B/(T/K)$		(1)	$\ln P = A - B/(T/K)$		(1a)		
$\log (P/\text{mmHg}) = A - B/(C + t/^{\circ}\text{C})$		(2)	$\ln P = A - B/(C + t/^{\circ}\text{C})$		(2a)		
$\log (P/\text{Pa}) = A - B/(C + T/K)$		(3)					
$\log (P/\text{mmHg}) = A - B/(T/K) - C \cdot \log (T/K)$		(4)

FIGURE 14.1.1.7.1 Logarithm of vapor pressure versus reciprocal temperature for 2,5-dimethylphenol.

14.1.1.8 2,6-Dimethylphenol

Common Name: 2,6-Dimethylphenol

Synonym: 2,6-xylenol, *vic-m*-xylenol

Chemical Name: 2,6-dimethylphenol

CAS Registry No: 576-26-1

Molecular Formula: $C_8H_{10}O$, $CH_3C_6H_3(CH_3)OH$

Molecular Weight: 122.164

Melting Point ($^{\circ}C$):

45.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

201.07 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1320 ($25^{\circ}C$, Andon et al. 1960)

Molar Volume (cm^3/mol):

107.9 ($25^{\circ}C$, calculated-density)

147.8 calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

10.60 (McLeese et al. 1979; Dean 1985; Varhaníčková et al. 1995)

10.63 (Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

60.41, 46.97 ($25^{\circ}C$, bp, Dreisbach 1955)

44.52 (at normal boiling point, Andon et al. 1960)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

75.6 (at $25^{\circ}C$, Andon et al. 1960; Dean 1992)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

18.9; 16.3 (exptl.; calculated-group additivity method, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$.), F: 0.625 (mp at $45.8^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

6230 (shake flask-UV at pH 5.1, Blackman et al. 1955)

13000* ($130^{\circ}C$, shake flask-optical method, measured range 130 – $241.2^{\circ}C$, Erichsen & Dobbett 1955)

9650 (generator column-HPLC, Wasik et al. 1981)

2900, 5900 (8 , $25^{\circ}C$, Leuenberger et al. 1985)

9560 ($20^{\circ}C$, shake flask-UV, Dohnal & Fenclová 1995)

6150 (shake flask-HPLC/UV at pH 6.3, Varhaníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

19.086 (calculated-Antoine eq., Dreisbach 1955)

$\log(P/mmHg) = 7.40318 - 1858.7/(199.0 + t/^{\circ}C)$; temp range 115 – $250^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

1333* ($92.5^{\circ}C$, ebulliometry, measured range 92.5 – $212.0^{\circ}C$, Vonterres et al. 1955)

23.3* ($24.67^{\circ}C$, ebulliometric and gas-saturation methods, measured range 4.75 – $40^{\circ}C$, Andon et al. 1960)

24.31 (calculated-Antoine eq. from ebulliometry/gas saturation measurements, Andon et al. 1960)

$\log(P/mmHg) = 12.5036 - 3948.27/(t/^{\circ}C + 273)$; temp range 4 – $40^{\circ}C$ (Antoine eq., ebulliometric and gas-saturation measurements, Andon et al. 1960)

$\log(P/mmHg) = 7.05753 - 1618.528/(t/^{\circ}C + 186.482)$; temp range 144 – $203^{\circ}C$ (Antoine eq., ebulliometric and gas-saturation measurements, Andon et al. 1960)

- 34.41 (extrapolated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 7.0707 - 1628.323/(187.603 + t/^{\circ}\text{C})$, temp range 144.8–203.5°C (Antoine eq. from reported exptl. data of Andon et al. 1960, Boublik et al. 1973)
- 33.68 (extrapolated-Cox eq., Chao et al. 1983)
 $\log (P/\text{mmHg}) = [1 - 474.112/(T/K)] \times 10^{\{0.99333 - 9.96552 \times 10^{-4} \cdot (T/K) + 8.34247 \times 10^{-7} \cdot (T/K)^2\}}$; temp range 321.81–701.65 K (Cox eq., Chao et al. 1983)
- 34.41, 10.37 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.19572 - 1628.413/(187.613 + t/^{\circ}\text{C})$, temp range 144.8–203.5°C (Antoine eq. from reported exptl. data of Andon et al. 1960, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.57979 - 1831.266/(188.83 + t/^{\circ}\text{C})$, temp range 97.5–212°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
- 34.4 (extrapolated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 7.00707 - 1628.32/(187.60 + t/^{\circ}\text{C})$; temp range 145–204°C (Antoine eq., Dean 1985, 1992)
- 19.09 (selected, Riddick et al. 1986)
- 24.0 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 11.6308 - 3950.681/(T/K)$; temp range 277–313 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.19544 - 1629.621/(-85.358 + T/K)$; temp range 417–476 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)
- 43.8 (extrapolated-four-parameter vapor pressure eq., Nesterova et al. 1990)
 $\log (P/\text{Pa}) = 39.83138 - 4062.725/(T/K) - 10.16994 \cdot \log (T/K) + 0.20170 \times 10^{-2} \cdot (T/K)$; temp range: 418–477 K (four-parameter vapor pressure eq. derived using exptl data of Andon et al. 1960, Nesterova et al. 1990)
 $\log (P/\text{mmHg}) = 87.1964 - 5.8721 \times 10^3/(T/K) - 28.853 \cdot \log (T/K) + 1.113 \times 10^{-2} \cdot (T/K) + 2.2316 \times 10^{-12} \cdot (T/K)^2$; temp range 319–701 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

- 0.684 (modified gas-stripping, Hawthorne et al. 1985)
 0.193 (8°C, Leuenberger et al. 1985)
 0.377 (calculated-P/C, Shiu et al. 1994)
 0.302 (calculated-activity coeff. γ^{∞} data, Dohnal & Fenclová 1995)
 10.3, 17.81, 25.2 (75.9, 88.7, 98.5°C, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)
 0.441 (extrapolated-vapor-liquid equilibrium measurements, Dohnal & Fenclová 1995)
 $\ln K_{AW} = 11.176 - 5906/(T/K)$, temp range 20–100°C (vapor-liquid equilibrium measurements with additional lit. data, Dohnal & Fenclová 1995)
 0.098 (calculated-group contribution, Lee et al. 2000)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated:

- 2.36 (Leo et al. 1971; Hansch & Leo 1979)
 2.34 (LC- k' correlation; Carlson et al. 1975)
 2.40 (35°C, shake flask-UV, Rogers & Wong 1980)
 2.31 (generator column-HPLC, Wasik et al. 1981)
 2.07 (HPLC- k' correlation, Haky & Young 1984)
 2.51 (HPLC-RT correlation, Eadsforth 1986)
 2.36 (recommended, Sangster 1989, 1993)
 2.36 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 65.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (Atkinson 1989)

$k_{OH}(\text{calc}) = 54.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ estimated from Atmospheric Oxidation Program, $k_{OH}(\text{exptl}) = 65.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; and $k_{OH}(\text{calc}) = 30.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ estimated from Fate of Atmospheric Pollutants Program (Meylan & Howard 1993)

$k_{OH}(\text{calc}) = 49.48 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital estimation method, Klamt 1993)

Hydrolysis:

Biodegradation: $t_{1/2} = 7\text{--}10 \text{ d}$ for bacteria to utilize 95% of 200 ppm in parent substrate (Tabak et al. 1964); average rate of biodegradation $9.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

FIGURE 14.1.1.8.1 Logarithm of vapor pressure versus reciprocal temperature for 2,6-dimethylphenol.

14.1.1.9 3,4-Dimethylphenol

Common Name: 3,4-Dimethylphenol

Synonym: 3,4-xylenol, *as-o*-xylenol

Chemical Name: 3,4-dimethylphenol

CAS Registry No: 95-65-8

Molecular Formula: $C_8H_{10}O$, $CH_3C_6H_3(CH_3)OH$

Molecular Weight: 122.164

Melting Point ($^{\circ}C$):

65.1 (Lide 2003)

Boiling Point ($^{\circ}C$):

227 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1380 ($25^{\circ}C$, Andon et al. 1960)

0.9830 (Weast 1982–83)

Molar Volume (cm^3/mol):

147.8 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

10.40 (McLeese et al. 1979)

10.32 (Dean 1985)

10.36 (Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

49.67 (at normal boiling point, Andon et al. 1960)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

85.73 (at $25^{\circ}C$, Andon et al. 1960; Dean 1992)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

18.13; 17.0 (exptl.; calculated-group additivity method, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.404 (mp at $65.1^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

5100 (shake flask-UV, Blackman et al. 1955)

5100* (synthetic method/shake flask-optical, extrapolated value, measured range 130 – $190.2^{\circ}C$, Ericksen & Dobbert 1955)

5000 (shake flask-spectrophotometry, Roberts et al. 1977)

12810 ($20^{\circ}C$, shake flask-UV, Dohnal & Fenclová 1995)

7250 (shake flask-HPLC/UV at pH 6.25, Varhaničková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($66.2^{\circ}C$, summary of literature data, temp range 66.2 – $225.2^{\circ}C$, Stull 1946)

5.160 (calculated-Antoine eq., Dreisbach 1955)

$\log(P/mmHg) = 7.70494 - 2030.9/(196.0 + t/^{\circ}C)$; temp range 130 – $265^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

- 1333* (105.7 °C, ebulliometry, measured range 105.7–226.0°C, Vonterres et al. 1955)
- 1.84* (24.88°C, ebulliometry/gas-saturation methods, measured range 9.89–49.36°C, Andon et al. 1960)
- 1.895 (interpolated-Antoine eq. from ebulliometry/gas saturation measurements, Andon et al. 1960)
- $\log (P/\text{mmHg}) = 13.1729 - 4478.23/(t/^{\circ}\text{C} + 273)$; temp range: 9–50°C, (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)
- $\log (P/\text{mmHg}) = 7.07343 - 1617.202/(t/^{\circ}\text{C} + 158.778)$; temp range 171–229°C (Antoine eq., ebulliometric and gas-saturation measurements, Andon et al. 1960)
- $\log (P/\text{mmHg}) = [-0.2185 \times 13991.0/(T/\text{K})] + 9.02680$; temp range 66.2–225.2°C (Antoine eq., Weast 1972–73)
- 2.541 (extrapolated-Antoine eq., Boublik et al. 1973)
- $\log (P/\text{mmHg}) = 7.07979 - 1621.451/(159.261 + t/^{\circ}\text{C})$; temp range 172–228°C (Antoine eq. from reported exptl. data of Andon et al. 1960, Boublik et al. 1973)
- 3.621 (extrapolated-Cox eq., Chao et al. 1983)
- $\log (P/\text{mmHg}) = [1 - 499.926/(T/\text{K})] \times 10^{[1.05062 - 10.2129 \times 10^{-4} \cdot (T/\text{K}) + 8.04338 \times 10^{-7} \cdot (T/\text{K})^2]}$; temp range: 353.20–729.65 K, (Cox eq., Chao et al. 1983)
- 7.327 (supercooled liquid P_L , extrapolated-Antoine eq., Boublik et al. 1984)
- $\log (P/\text{kPa}) = 6.20545 - 1622.411/(159.947 + t/^{\circ}\text{C})$; temp range 172–228°C (Antoine eq. from reported exptl. data of Andon et al. 1960, Boublik et al. 1984)
- $\log (P/\text{kPa}) = 7.46831 - 2538.736/(239.359 + t/^{\circ}\text{C})$; temp range 105.7–226°C (Antoine eq. from reported exptl. data of Vonterres et al. 1955, Boublik et al. 1984)
- 2.540 (extrapolated-Antoine eq., Dean 1985)
- $\log (P/\text{mmHg}) = 7.07919 - 1621.45/(159.26 + t/^{\circ}\text{C})$; temp range 172–229°C (Antoine eq., Dean 1985, 1992)
- 5.160 (Riddick et al. 1986)
- 1.865 (solid P_S , interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
- $\log (P_S/\text{kPa}) = 12.31521 - 4485.592/(T/\text{K})$; temp range 282–323 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 6.20617 - 1623.592/(-113.623 + T/\text{K})$; temp range 444–502 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)
- 3.795 (extrapolated-four parameter vapor pressure eq., Nesterova et al. 1990)
- $\log (P/\text{Pa}) = 93.28460 - 6735.317/(T/\text{K}) - 29.48566 \cdot \log (T/\text{K}) + 0.95432 \times 10^{-2} \cdot (T/\text{K})$; temp range: 445–502 K (four-parameter vapor pressure eq. derived using exptl data of Andon et al. 1950, Nesterova et al. 1990)
- $\log (P/\text{mmHg}) = 68.6521 - 6.15 \times 10^3/(T/\text{K}) - 20.184 \cdot \log (T/\text{K}) - 1.1259 \times 10^{-10} \cdot (T/\text{K}) + 4.0266 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 338–730 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

- 0.00942 (Leuenberger et al. 1985)
- 0.0212 (calculated-P/C, Shiu et al. 1994)
- 0.0278 (20°C, calculated-activity coeff. γ^{∞} data, Dohnal & Fenclová 1995)
- 1.416, 2.903, 4.619 (75.9, 88.7, 98.5°C, vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)
- 0.0421 (extrapolated-vapor-liquid equilibrium measurements, Dohnal & Fenclová 1995)
- $\ln K_{AW} = 11.854 - 6809/(T/\text{K})$, temp range 20–100°C (vapor-liquid equilibrium VLE measurements with additional lit. data, Dohnal & Fenclová 1995)
- 0.098 (calculated-group contribution, Lee et al. 2000)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 2.23 (20°C, shake flask-UV, Korenman 1973)
- 2.23 (shake flask, Korenman et al. 1980)
- 2.23 (recommended, Sangster 1989, 1993)
- 2.23 (recommended, Hansch et al. 1995)
- 2.36 (HPLC-RT correlation, Makovskaya et al. 1995b)
- 2.26 (solid-phase micro-extraction, Dean et al. 1996)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 81.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (Atkinson 1989)

$k_{OH}(\text{calc}) = 55.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital estimation method, Klamt 1993)

Biodegradation: average rate of biodegradation $13.4 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

FIGURE 14.1.1.9.1 Logarithm of vapor pressure versus reciprocal temperature for 3,4-dimethylphenol.

14.1.1.10 3,5-Dimethylphenol

Common Name: 3,5-Dimethylphenol

Synonym: 3,5-xilenol, 1-hydroxy-3,5-dimethylbenzene

Chemical Name: 3,5-dimethyl phenol

CAS Registry No: 108-68-9

Molecular Formula: $C_8H_{10}O$ $CH_3C_6H_3(CH_3)OH$

Molecular Weight: 122.164

Melting Point ($^{\circ}C$):

63.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

221.74 (Lide 2003)

Density (g/cm^3):

Acid Dissociation Constants, pK_a :

7.8 (McLeese et al. 1979)

10.19 (Dohnal & Fenclová 1995)

Molar Volume (cm^3/mol):

147.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

82.84, 49.31 ($25^{\circ}C$, normal bp, Andon et al. 1960)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F: 0.420 (mp at $63.4^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

4886 (shake flask-UV, pH 5.1, Blackman et al. 1955)

4425 ($20^{\circ}C$, shake flask-UV, Dohnal & Fenclová 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($62.0^{\circ}C$, summary of literature data, temp range 62 – $219.5^{\circ}C$, Stull 1947)

1333* ($102.8^{\circ}C$, ebulliometry, measured range 102.8 – $219.0^{\circ}C$, Vonterres et al. 1955)

2.63* ($24.95^{\circ}C$, ebulliometry/gas saturation, measured range 9 – $45^{\circ}C$, Andon et al. 1960)

$\log(P/mmHg) = 12.8271 - 4328.13/(t/^{\circ}C + 273)$; temp range 9 – $50^{\circ}C$ (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)

$\log(P/mmHg) = 7.11745 - 1630.124/(t/^{\circ}C + 163.076)$; temp range 154 – $224^{\circ}C$ (Antoine eq. from ebulliometric and gas-saturation measurements, Andon et al. 1960)

$\log(P/kPa) = 6.25752 - 1641.206/(164.311 + t/^{\circ}C)$, temp range 154.7 – $223.3^{\circ}C$ (Antoine eq. derived from reported exptl data of Andon et al. 1960, Boublik et al. 1984)

$\log(P/kPa) = 8.27972 - 3182.232/(287.862 + t/^{\circ}C)$, temp range 102.8 – $219^{\circ}C$ (Antoine eq. derived from reported exptl data of Vonterres et al. 1960, Boublik et al. 1984)

$\log(P_s/kPa) = 11.97153 - 4336.025/(T/K)$; temp range 282 – $323\ K$ (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.25292 - 1638.564/(-109.095 + T/K)$; temp range 427 – $497\ K$ (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P/mmHg) = -44.915 - 2.8912 \times 10^3/(T/K) + 25.704 \cdot \log(T/K) - 3.9714 \times 10^{-2} \cdot (T/K) + 1.6464 \times 10^{-5} \cdot (T/K)^2$; temp range 337 – $716\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

0.0419, 0.0614 (20, 25°C , calculated-limiting activity coefficient γ^∞ data, Dohnal & Fenclová 1995)

1.95, 3.70, 6.12 (75.9, 88.7, 98.5°C , vapor-liquid equilibrium-GC, Dohnal & Fenclová 1995)

$\ln K_{\text{AW}} = 11.654 - 6636/(T/\text{K})$; temp range $20\text{--}98.5^\circ\text{C}$ (vapor-liquid equilibrium VLE data, Dohnal & Fenclová 1995)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

2.31 (shake flask, Korenman 1972; Korenman et al. 1980)

2.55 (shake flask-UV, Rogers & Wong 1980)

2.38 (UNIFAC activity coefficient, Campbell & Luthy 1985)

2.54 (HPLC-RT correlation, Eadsforth 1986)

2.35 (shake flask, Log P Database, Hansch & Leo 1987)

2.35 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$ or $\log K_{\text{B}}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

FIGURE 14.1.1.10.1 Logarithm of vapor pressure versus reciprocal temperature for 3,5-dimethylphenol.

14.1.1.11 2,3,5-Trimethylphenol

Common Name: 2,3,5-Trimethylphenol

Synonym:

Chemical Name: 2,3,5-trimethylphenol

CAS Registry No: 697-82-5

Molecular Formula: $C_9H_{12}O$, $C_6H_2(CH_3)_3OH$

Molecular Weight: 136.190

Melting Point ($^{\circ}C$):

94.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

233 (Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

10.60 (Blackman et al. 1955)

Molar Volume (cm^3/mol):

170.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.208 (mp at $94.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

40000* (200 $^{\circ}C$, synthetic method/shake flask-optical, measured range 200–248 $^{\circ}C$, Erichsen & Dobbert 1955)

762 (shake flask-UV, Blackman et al. 1955)

855 (shake flask-HPLC/UV at pH 5.95, Varhaníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2.426* (extrapolated-Antoine eq., ebulliometry, measured range 186–247 $^{\circ}C$, Handley et al. 1964)

$\log (P/mmHg) = 7.08022 - 1685.973/(166.150 + t/^{\circ}C)$; temp range 186–247 $^{\circ}C$ (Antoine eq., ebulliometric method, Handley et al. 1964)

4.451 (extrapolated-Cox eq., Chao et al. 1983)

$\log (P/mmHg) = [1 - 508.477/(T/K)] \times 10^{0.932965 - 5.75276 \times 10^{-4} \cdot (T/K) + 3.29737 \times 10^{-7} \cdot (T/K)^2}$; temp range: 459.63–520.21 K, (Cox eq., Chao et al. 1983)

2.426 (extrapolated-Antoine eq., Boublik et al. 1973)

$\log (P/mmHg) = 7.08012 - 1685.896/(166.141 + t/^{\circ}C)$, temp range 186.5–247 $^{\circ}C$ (Antoine eq. from reported exptl. data of Handley et al. 1964, Boublik et al. 1984)

2.43, 0.0234 (extrapolated from liquid, Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.02493 - 1685.528/(166.133 + t/^{\circ}C)$, temp range 186.5–247 $^{\circ}C$ (Antoine eq. from reported exptl. data of Handley et al. 1964, Boublik et al. 1984)

$\log (P/kPa) = 6.95436 - 889.02/(67.752 + t/^{\circ}C)$, temp range 106–233 $^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

2.43 extrapolated-Antoine eq., Dean 1985)

$\log (P/mmHg) = 7.08012 - 1685.90/(166.14 + t/^{\circ}C)$, temp range 186–247 $^{\circ}C$ (Antoine eq., Dean 1985, 1992)

2.44 (extrapolated, liquid, Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.20676 - 1687.869/(-106.761 + T/K)$, temp range 459–531 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{Pa}) = 89.62984 - 6541.396/(T/\text{K}) - 28.26318 \cdot \log (T/\text{K}) + 0.92991 \times 10^{-2} \cdot (T/\text{K})$; temp range: 460–520 K
(four-parameter vapor pressure eq. derived using exptl data of Handley et al. 1964, Nesterova et al. 1990)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

0.404 (calculated-P/C, this work)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

14.1.1.12 2,4,6-Trimethylphenol

Common Name: 2,4,6-Trimethylphenol

Synonym: Mesityl

Chemical Name: 2,4,6-Trimethylphenol

CAS Registry No: 527-60-6

Molecular Formula: $C_9H_{12}O$, $C_6H_2(CH_3)_3OH$

Molecular Weight: 136.190

Melting Point ($^{\circ}C$):

73 (Lide 2003)

Boiling Point ($^{\circ}C$):

220 (Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

10.90 (Blackman et al. 1955)

10.88 (Dean 1985)

Molar Volume (cm^3/mol):

170.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, F: 0.338 (mp at $73^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1007 (shake flask-UV, Blackman et al. 1955; quoted, Varháníčková et al. 1995)

1420 (shake flask-HPLC/UV at pH 4.85, Varháníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

7.0 (extrapolated from liquid state, Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 5.91352 - 1481.329/(158.589 + t/^{\circ}C)$, temp range $94-220.6^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

19.6 (supercooled liquid P_L , extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.82395 - 2158.2/(-45.2 + T/K)$, temp range $367-494 K$ (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

0.2512 (calculated-P/C, Shiu et al. 1994)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.73 (generator column-HPLC/UV, Wasik et al. 1981)

2.73 (quoted and recommended, Sangster 1989; 1993)

2.7 3 (COMPUTOX databank, Kaiser 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.1.13 3,4,5-Trimethylphenol

Common Name: 3,4,5-Trimethylphenol

Synonym:

Chemical Name: 3,4,5-trimethylphenol

CAS Registry No: 527-54-8

Molecular Formula: $C_9H_{12}O$, $C_6H_2(CH_3)_3OH$

Molecular Weight: 136.190

Melting Point ($^{\circ}C$):

108 (Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

249 (Stephenson & Malanowski 1987)

248.5 (Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

10.25 (Dean 1985)

Molar Volume (cm^3/mol):

170.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.153 (mp at $108^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1538 (shake flask-HPLC/UV, Varhaníčková et al. 1994)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P_L/kPa) = 7.33216 - 2536.1/(-44.56 + T/K)$, temp range 396–521 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.1.14 *o*-Ethylphenol

Common Name: 2-Ethylphenol

Synonym: *o*-ethylphenol

Chemical Name: 2-ethylphenol, *o*-ethylphenol

CAS Registry No: 90-00-6

Molecular Formula: C₈H₁₀O, C₂H₅C₆H₄OH

Molecular Weight: 122.164

Melting Point (°C):

18 (Lide 2003)

Boiling Point (°C): 204.52

204.5 (Lide 2003)

Density (g/cm³ at 20°C):

1.01885, 1.01459 (20°C, 25°C Biddiscombe et al. 1963)

1.0370 (Verschuereen 1983; 25°C, Dean 1985)

Molar Volume (cm³/mol):

117.8 (0°C, Stephenson & Malanowski 1987)

147.8 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a:

10.02 (Dean 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

14040 (shake flask-HPLC/UV at pH 5.2, Varhaníčková et al. 1995)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* (46.2 °C, summary of literature data, temp range 46.2–207.5°C, Stull 1947)

33.66 (calculated-Antoine eq., Dreisbach 1955)

log (P/mmHg) = 7.23343 – 1771.5/(200.0 + t/°C), temp range 105–245°C (Antoine eq. for liquid state, Dreisbach 1955)

20.84 (interpolated-Antoine eq., Biddiscombe et al. 1963)

20.4* (24.93°C, ebulliometric and gas transpiration measurements, measured range 5–45°C, Biddiscombe & Martin 1958)

log (P/mmHg) = 10.3131 – 3313.50/(t/°C + 273); temp range 5–45°C (Antoine eq. from ebulliometric and gas transpiration methods, Biddiscombe et al. 1963)

log (P/mmHg) = 7.00742 – 1648.923/(t/°C + 170.833); temp range 150–218°C (Antoine eq. from ebulliometric and gas transpiration methods, Biddiscombe et al. 1963)

log (P/mmHg) = [–0.2185 × 12516.7/(T/K)] + 8.586948; temp range 46.2–207.5°C (Antoine eq., Weast 1972–73)

log (P/mmHg) = [1– 480.731/(T/K)] × 10⁴{0.883881 – 6.07675 × 10^{–4}·(T/K) + 6.44264 × 10^{–7}·(T/K)²}; temp range: 319.35–480.65 K, (Cox eq., Chao et al. 1983)

16.7, 29 (extrapolated-Antoine eq., Boublik et al. 1984)

log (P/kPa) = 6.13214 – 1548.802/(170.82 + t/°C), temp range 150.4–215.05°C (Antoine eq. from reported exptl. data of Biddiscombe et al. 1963, Boublik et al. 1984)

log (P/kPa) = 6.97225 – 2178.815/(231.035 + t/°C), temp range 86–207.5°C (Antoine eq. from reported exptl. data of Vonterres et al. 1955, Boublik et al. 1984)

27.01 (extrapolated-Antoine eq., Dean 1985)

log (P/mmHg) = 7.8003 – 2140.4/(227 + t/°C), temp range 86–208°C (Antoine eq., Dean 1985, 1992)

20.87 (interpolated-Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.13344 - 1550.409/(-102.103 + T/\text{K})$; temp range 423–491 K (Antoine eq.-I, liquid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 9.44878 - 3318.181/(T/\text{K})$, temp range 277–318 K (Antoine eq.-II, Stephenson & Malanowski 1987)

19.55 (extrapolated-Antoine eq., Nesterova et al. 1990)

$\log (P/\text{Pa}) = 94.95377 - 6350.841/(T/\text{K}) - 30.56287 \cdot \log (T/\text{K}) + 1.09475 \times 10^{-2} \cdot (T/\text{K})$; temp range: 424–491 K (four-parameter vapor pressure eq. derived using exptl data of Biddiscombe et al. 1963, Nesterova et al. 1990)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

0.174 (calculated with selected-P/C)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.47 (shake flask, Hansch & Leo 1979)

2.64 (shake flask, Korenman 1980)

2.64 (HPLC-RT correlation, Butte et al. 1981)

2.47 (recommended, Sangster 1989, 1993)

14.1.1.15 *p*-Ethylphenol

Common Name: 4-Ethylphenol

Synonym: *p*-ethylphenol

Chemical Name: 2-ethylphenol, *p*-ethylphenol

CAS Registry No: 123-07-9

Molecular Formula: $C_8H_{10}O$, $C_2H_5C_6H_4OH$

Molecular Weight: 122.164

Melting Point ($^{\circ}C$):

45 (Lide 2003)

Boiling Point ($^{\circ}C$):

217.9 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.054 ($25^{\circ}C$, Biddiscombe et al. 1963)

1.011 ($25^{\circ}C$, Dean 1985)

Molar Volume (cm^3/mol):

147.8 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

10.0 (Dean 1985)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

50.84 (at normal boiling point, Biddiscombe et al. 1963)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

80.33 (at $25^{\circ}C$, Andon et al. 1960)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F : 0.636 (mp at $45^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

24000* ($150^{\circ}C$, synthetic method-shake flask-optical, measured range 150 – $187^{\circ}C$, Erichsen & Dobbert 1955)

5000 (shake flask-spectrophotometry, Roberts et al. 1977)

7980 (shake flask-HPLC/UV, Varhaníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($59.3^{\circ}C$, summary of literature data, temp range 59.3 – $219.0^{\circ}C$, Stull 1947)

9.67 (calculated-Antoine eq., Dreisbach 1955)

$\log(P/mmHg) = 7.55177 - 1943.1/(197.0 + t/^{\circ}C)$, temp range: 125 – $255^{\circ}C$, (Antoine eq. for liquid state, Dreisbach 1955)

1333* ($101.0^{\circ}C$, ebulliometry, measured range 101.0 – $218.2^{\circ}C$, Vonterres et al. 1955)

5.030 (calculated-Antoine eq., Biddiscombe et al. 1963)

4.96* ($25.03^{\circ}C$, ebulliometric and gas transpiration measurements, measured range 5 – $44^{\circ}C$, Biddiscombe et al. 1963)

$\log(P/mmHg) = 12.6090 - 4183.50/(t/^{\circ}C + 273)$; temp range 5 – $44^{\circ}C$ (Antoine eq. from ebulliometric and gas transpiration methods, Biddiscombe et al. 1963)

$\log(P/mmHg) = 7.01297 - 1548.923/(t/^{\circ}C + 156.820)$; temp range 171 – $229^{\circ}C$ (Antoine eq. from ebulliometric and gas transpiration methods, Biddiscombe et al. 1963)

$\log (P/\text{mmHg}) = [-0.2185 \times 13437.9/(T/K)] + 8.854990$; temp range 59.3–219°C (Antoine eq., Weast 1972–73)
 6.575 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.13614 - 1547.614/(156.677 + t/^\circ\text{C})$, temp range 171.8–229.1°C (Antoine eq. from reported exptl. data of Biddiscombe et al. 1963, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 7.59041 - 2575.507/(242.273 + t/^\circ\text{C})$, temp range 101–218.2°C (Antoine eq. from reported exptl. data of Vonterres et al. 1955, Boublik et al. 1984)
 7.530 (extrapolated-Antoine eq., Dean 1985)
 $\log (P/\text{mmHg}) = 8.291 - 2423/(229 + t/^\circ\text{C})$, temp range 101–218°C (Antoine eq., Dean 1985, 1992)
 4.95 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 11.74364 - 4188.624/(T/K)$, temp range 278–317 K, (Antoine eq.-I, solid, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.13939 - 1550.479/(-116.1 + T/K)$, temp range: 444–503 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)
 6.137 (extrapolated-four-parameter vapor pressure eq., Nesterova et al. 1990)
 $\log (P/\text{Pa}) = 96.72774 - 6779.787/(T/K) - 30.80658 \cdot \log (T/K) + 1.101581 \times 10^{-2} \cdot (T/K)$; temp range: 445–502 K (four-parameter vapor pressure eq. derived using exptl data of Biddiscombe et al. 1963, Nesterova et al. 1990)
 $\log (P/\text{mmHg}) = 16.9092 - 3.7255 \times 10^3/(T/K) - 1.7886 \cdot \log (T/K) - 4.2275 \times 10^{-3} \cdot (T/K) + 1.8002 \times 10^{-6} \cdot (T/K)^2$; temp range 318–716 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

0.132 (calculated-P/C, this work)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.75 (literature average, Leo et al. 1971)

FIGURE 14.1.15.1 Logarithm of vapor pressure versus reciprocal temperature for *p*-ethylphenol.

14.1.1.16 4-Propylphenol

Common Name: 4-Propylphenol

Synonym:

Chemical Name: 4-propylphenol

CAS Registry No: 645-56-7

Molecular Formula: $C_9H_{12}O$, $C_3H_7C_6H_4OH$

Molecular Weight: 136.190

Melting Point ($^{\circ}C$):

22 (West 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

232.6 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.009 (Weast 1982–83)

Acid Dissociation Constant, pK_a :

Molar Volume (cm^3/mol):

170.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1278 (shake flask-HPLC/UV, Varhaníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P_L/kPa) = 7.32632 - 2550.1/(-28.65 + T/K)$, temp range 383–508 K, (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.1 (HPLC-RT correlation, McLeese et al. 1979)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.1.17 *p*-*tert*-Butylphenol

Common Name: 4-*tert*-Butylphenol

Synonym: *p*-*tert*-butylphenol, 4-(α,α -dimethylethylphenol)

Chemical Name: 4-*tert*-butylphenol, *p*-*tert*-butylphenol

CAS Registry No: 98-54-4

Molecular Formula: $C_{10}H_{14}O$, $(CH_3)_3CC_6H_4OH$

Molecular Weight: 150.217

Melting Point ($^{\circ}C$):

98 (Lide 2003)

Boiling Point ($^{\circ}C$):

237 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

152.0 ($20^{\circ}C$, Stephenson & Malanowski 1987)

192.2 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

9.90 (McLeese et al. 1979)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

67.33, 50.62 ($25^{\circ}C$, bp, Dreisbach 1955)

50.54 (at normal boiling point, Handley et al. 1964)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, F: 0.192 (mp at $98^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

650 (20 – $25^{\circ}C$, Geyer et al. 1981)

1000 (Thomas 1982)

700 (Verschueren 1983)

580 (Yalkowsky et al. 1987)

580 (shake flask-UV, Ahel & Giger 1993a)

1850 (shake flask-HPLC/UV at pH 6.05, Varhanířková et al. 1995)

753 (calculated-group contribution, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

6.402* (extrapolated-regression of tabulated data, temp range 70 – $238^{\circ}C$, Stull 1947)

3.688 (calculated-Antoine eq., Dreisbach 1955)

$\log(P/mmHg) = 7.49264 - 1999.8/(194.0 + t/^{\circ}C)$, temp range 140 – $370^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

1.225* (liquid, extrapolated-Antoine eq., ebulliometry, measured range 198 – $251^{\circ}C$, Handley et al. 1964)

$\log(P/mmHg) = 11.5638 - 3586.36/(t/^{\circ}C + 273)$; temp range 198 – $251^{\circ}C$ (Antoine eq. from ebulliometric measurements, Handley et al. 1964)

$\log(P/mmHg) = [-0.2185 \times 13787.7/(T/K)] + 8.785696$; temp range 70 – $238^{\circ}C$ (Antoine eq., Weast 1972–73)

5.072 (extrapolated-Cox eq., Chao et al. 1983)

$\log(P/mmHg) = [1 - 512.693/(T/K)] \times 10^4 \{0.834403 - 2.10918 \times 10^{-4} \cdot (T/K) + 0.554077 \times 10^{-7} \cdot (T/K)^2\}$; temp range 343.15 – $524.76 K$ (Cox eq., Chao et al. 1983)

1.24 (supercooled liquid P_L , extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.12365 - 1626.256/(155.092 + t/^{\circ}\text{C})$; temp range 198–231.6°C (Antoine eq. from reported exptl. data of Handley et al. 1964, Boublik et al. 1984)

1.25 (extrapolated-Antoine eq., Dean 1985)

$\log (P/\text{mmHg}) = 7.00038 - 1627.51/(155.24 + t/^{\circ}\text{C})$, temp range 198–252°C (Antoine eq., Dean 1985, 1992)

1.272 (extrapolated-liquid, Antoine eq., Stephenson & Malanowski 1987)

0.492 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_s/\text{kPa}) = 11.46945 - 4405.873/(T/\text{K})$; temp range 280–304 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.13162 - 1632.939/(-117.258 + T/\text{K})$, temp range: 471–525 K, (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

$\log (P/\text{Pa}) = 122.26679 - 8003.926/(T/\text{K}) - 40.16380 \cdot \log (T/\text{K}) + 1.40155 \times 10^{-2} \cdot (T/\text{K})$; temp range 471–525 K (four-parameter vapor pressure eq. derived using exptl data of Biddiscombe et al. 1963, Nesterova et al. 1990)

$\log (P/\text{mmHg}) = -54.7404 - 2.4727 \times 10^3/(T/\text{K}) + 28.991 \cdot \log (T/\text{K}) - 3.9356 \times 10^{-3} \cdot (T/\text{K}) + 1.543 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 372–734 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

0.113 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

0.139; 3.750 (calculated-group contribution; calculated-bond contribution, Hine & Mookerjee 1975)

0.922 (calculated-P/C, Thomas 1982)

0.113, 0.375 (quoted, calculated-MCI χ , Nirmalakhandan & Speece 1988)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.04 (shake flask, Geyer et al. 1984)

2.94, 3.14 (shake flask-OECD 1981 Guideline, Geyer et al. 1984)

3.41 (HPLC-RT correlation, Butte et al. 1987)

3.04 (recommended, Sangster 1989)

3.31 (recommended, Hansch et al. 1995)

3.10 (HPLC-RT correlation, Makovskaya et al. 1995b)

2.95 (solid-phase microextraction, Dean et al. 1996)

Bioconcentration Factor, $\log \text{BCF}$:

1.53 (*Chlorella*, after exposure to 50 $\mu\text{g}/\text{L}$ for 24 h, Geyer et al. 1981)

1.88 (calculated-S, Geyer et al. 1981)

1.53; 2.08 (algae, golden *orfe*, Freitag et al. 1982)

2.38 (activated sludge, Freitag et al. 1982, 1985)

1.53 (Alga *Chlorella fusca*, wet weight basis, Geyer et al. 1984)

1.48; 2.07 (algae; golden ide, Freitag et al. 1985)

1.86 (zebrafish, Butte et al. 1987; quoted, Devillers et al. 1996)

2.38; 1.48; 2.07 (activated sludge; algae; fish; Freitag et al. 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: volatilization

$t_{1/2} = 117$ h from water body with depth of 1 m (Thomas 1982).

Half-Lives in the Environment:

TABLE 14.1.1.17.1

Reported vapor pressures of *p*-*tert*-butylphenyl at various temperatures and the coefficients for the vapor pressure equations

$$\log P = A - B/(T/K) \quad (1) \quad \ln P = A - B/(T/K) \quad (1a)$$

FIGURE 14.1.1.17.1 Logarithm of vapor pressure versus reciprocal temperature for *p*-*tert*-butylphenol.

14.1.1.18 4-Octylphenol

Common Name: 4-Octylphenol

Synonym: *p*-octylphenol

Chemical Name: 4-octylphenol

CAS Registry No: 27193-28-8

Molecular Formula: $C_{14}H_{22}O$, $C_8H_{17}-C_6H_4OH$

Molecular Weight: 206.324

Melting Point ($^{\circ}C$):

43 (Lide 2003)

Boiling Point ($^{\circ}C$):

280-283 (Lewis 1996)

Density (g/cm^3 at $20^{\circ}C$):

0.941 (at $24^{\circ}C$, Lewis 1996)

Molar Volume (cm^3/mol):

281.0 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.666 (mp at $43^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

12.6 ± 0.50 (generator column-HPLC/fluo., Ahel & Giger 1993a)

14.1 ± 0.60 (shake flask-HPLC/UV, Varhaníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$):

0.071 (quoted, Shiu et al. 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

0.4916 (calculated-P/C, Shiu et al. 1994)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.70 (calculated- π substituent const. or fragment const., McLeese et al. 1981)

4.12 ± 0.10 (shake flask-HPLC/fluo., Ahel & Giger 1993b)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation: average exptl. rate constant $k = 0.0894 h^{-1}$ compared to group contribution method predicted rate constants $k = 0.1124 h^{-1}$ (nonlinear) and $k = 0.0982 h^{-1}$ (Tabak & Govind 1993).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

14.1.1.19 4-Nonylphenol

Common Name: 4-Nonylphenol

Synonym: *p*-nonylphenol

Chemical Name: 4-nonylphenol

CAS Registry No: 104-40-5; 25154-52-3

Molecular Formula: $C_{15}H_{24}O$, $C_9H_{19}C_6H_4OH$

Molecular Weight: 220.351

Melting Point ($^{\circ}C$):

42 (Lide 2003)

Boiling Point ($^{\circ}C$):

approx. 295 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.513 (Budavari 1989)

Molar Volume (cm^3/mol):

231.1 ($20^{\circ}C$, Stephenson & Malanowski 1987)

303.2 (calculated-Le Bas method at normal boiling)

Acid Dissociation Constant, pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.681 (mp at $42^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

5.43 ± 0.17 (generator column-HPLC/fluor., Ahel & Giger 1993a)

4.90 ± 0.4 (shake flask-GC/FID, Brix et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.0701* (ebulliometry, extrapolated, measured range 214.78 – $321.91^{\circ}C$, Hon et al. 1976)

$\log (P/mmHg) = 7.74950 - 2550.67/(260.28 + t/^{\circ}C)$; temp range 214.78 – $321.91^{\circ}C$ (Antoine eq., ebulliometry, Hon et al. 1976)

0.0720 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.8847 - 2560.53/(207.199 + t/^{\circ}C)$, temp range 214.8 – $321.8^{\circ}C$ (Antoine eq. from reported exptl. data of Hon et al. 1976, Boublik et al. 1984)

0.0691 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.87147 - 2547.289/(-67.246 + T/K)$, temp range 487 – $595 K$ (Antoine eq., Stephenson & Malanowski 1987)

0.174, 0.14, 0.109, 0.0908, 0.0802, 0.0556 (GC-RT correlation, 7 isomers, Bidleman & Renberg 1985)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

1.5705 (calculated-P/C, Shiu et al. 1994)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.20 (calculated- π substituent const. or fragment const., McLeese et al. 1981)

4.10 (Geyer et al. 1982)

5.90 (selected, Yoshida et al. 1986)

5.76 (HPLC-RT correlation, Itokawa et al. 1989)

4.48 ± 0.12 (shake flask-HPLC/fluor., Ahel & Giger 1993b)

6.36 (calculated-CLOGP 3.51, Jaworska & Schultz 1993)

- 6.36 (COMPUTOX, Kaiser 1993)
 5.76 (Sangster 1993; Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 2.45 (salmon, McLeese et al. 1981)
 1.00 (mussel *mytilus edulis*, Geyer et al. 1982)
 2.40 (fish liver, Ahel & Giger 1993a)
 2.22; 2.45 (laboratory BCF data: killifish; salmon; Tsuda et al. 2000)
 1.49; 1.32; 1.40; 1.34; 1.32; 1.18; 1.11–2.61 (field BCF data: pale chub; Ayu sweetfish, dark chub, crucian carp; large-mouth bass; bluegill; fish tissue; Tsuda et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation: average exptl. rate constant of 0.0894 h^{-1} compared to group contribution method predicted rate constants of 0.1124 h^{-1} (nonlinear) and 0.0982 h^{-1} (linear) (Tabak & Govind 1993).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 45.0 \text{ d}^{-1}$ (McLeese et al. 1981)

$k_2 = 0.16 \text{ d}^{-1}$ (McLeese et al. 1981)

Half-Lives in the Environment:

Biota: $t_{1/2} = 4 \text{ d}$ in salmon before excretion (McLeese et al. 1981).

14.1.1.20 1-Naphthol

Common Name: 1-Naphthol

Synonym: α -naphthol, 1-naphthalenol, 1-hydroxynaphthalene

Chemical Name: 1-naphthol

CAS Registry No: 90-15-3

Molecular Formula: $C_{10}H_8O$, $C_{10}H_7OH$

Molecular Weight: 144.170

Melting Point ($^{\circ}C$):

95 (Lide 2003)

Boiling Point ($^{\circ}C$):

288.0 (sublimation, Weast 1982–83; Dean 1985; Lide 2003)

Density (g/cm^3):

1.0989 ($99^{\circ}C$, Weast 1982–83)

1.0954 ($99^{\circ}C$, Dean 1985)

Acid Dissociation Constant, pK_a :

9.20 (McLeese et al. 1979)

9.30 (Dean 1985)

Molar Volume (cm^3/mol):

131.2 ($99^{\circ}C$, Stephenson & Malanowski 1987)

155.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.47 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

63.6 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\cdot K$, F: 0.206 (mp at $95^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

438 (quoted, Tsonopoulos & Prausnitz 1971)

870; 674 (exptl., calculated-group contribution, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1.550* (extrapolated-regression of tabulated data, temp range 94 – $282.5^{\circ}C$, Stull 1947)

1333* ($141.5^{\circ}C$, ebulliometry, measured range 141.5 – $282.5^{\circ}C$, Vonterres et al. 1955)

$\log(P/mmHg) = [-0.2185 \times 14205.6/(T/K)] + 8.476669$; temp range 94 – $282.5^{\circ}C$ (Antoine eq., Weast 1972–73)

0.509 (extrapolated-liquid, Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.69308 - 2275.566/(202.869 + t/^{\circ}C)$, temp range 141.5 – $282.5^{\circ}C$ (Antoine eq. from reported exptl. data of Vonterres et al. 1955, Boublik et al. 1984)

0.290 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 7.28421 - 2077.56/(184.0 + t/^{\circ}C)$; temp range 141 – $282^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log(P_s/kPa) = 12.20753 - 4873.394/(T/K)$; temp range 298 – $312\ K$ (Antoine eq.-I, α form, solid, Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 10.70115 - 4405.522/(T/K)$; temp range 314 – $324\ K$ (Antoine eq.-II, β form, solid, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.53825 - 3083.8/(1.731 + T/K)$; temp range 399 – $556\ K$ (Antoine eq.-III, liquid, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa\cdot m^3/mol$ at $25^{\circ}C$):

0.49 (calculated-P/C, this work)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.98	(shake flask-UV, Hansch & Anderson 1967)
2.98, 2.84, 2.31	(Hansch & Leo 1979)
2.28	(HPLC- k' correlation, Haky & Young 1984)
2.84	(recommended, Sangster 1989, 1993)
2.84	(CPC centrifugal partition chromatography, Gluck & Martin 1990)
3.13	(back-flushing-CPC centrifugal partition chromatography, Menges et al. 1990)
2.81	(shake flask-HPLC, Menges et al. 1991)
3.02	(concurrent chromatography, Berthod et al. 1988)
2.84	(COMPUTOX, Kaiser 1993)
2.43	(HPLC-RT correlation, Ritter et al. 1994)
2.84	(recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:Bioconcentration Factor, $\log BCF$:Sorption Partition Coefficient, $\log K_{OC}$:

2.64	(soil and sediment, Hassett et al. 1981)
3.33	(soil, Means et al. 1982)
3.41	(soil, calculated-MCI χ , Sabljic 1987)
2.10–2.77	(soil, calculated- K_{OW} , model of Karickhoff et al. 1979, Sabljic 1987)
2.63–2.99	(soil, calculated- K_{OW} , model of Kenaga & Goring 1980, Sabljic 1987)
1.84–2.1	(soil, calculated- K_{OW} , model of Briggs 1981, Sabljic 1987)
1.99–2.66	(soil, calculated- K_{OW} , model of Means et al. 1982, Sabljic 1987)
1.30–1.90	(soil, calculated- K_{OW} , model of Chiou et al. 1983, Sabljic 1987)
2.89	(soil, calculated-MCI χ , Bahnick & Doucette 1988)
2.52–2.96, 2.53	(soil: quoted, calculated- K_{OW} , Xing et al. 1994)
1.92–2.64	(organic sorbent: cellulose, lignin, Xing et al. 1994)
3.31, 2.91, 2.61	(RP-HPLC- k' correlation on 3 different stationary phases, Szabo et al. 1995)
2.61; 3.48	(HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1998)

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation: average rate of biodegradation 38.4 mg COD $g^{-1} \cdot h^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environmental Compartments:

14.1.1.22 2-Phenylphenol (2-Hydroxybiphenyl)

Common Name: 2-Phenylphenol

Synonym: *o*-phenylphenol, 2-hydroxybiphenyl, [1,1'-biphenyl]-2-ol

Chemical Name: 2-phenylphenol

CAS Registry No: 90-43-7

Molecular Formula: $C_{12}H_{10}O$, $C_6H_5C_6H_4OH$

Molecular Weight: 170.206

Melting Point ($^{\circ}C$):

57.5 (Weast 1982–83)

Boiling Point ($^{\circ}C$):

286 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.213 (Dean 1985)

1.200 ($25^{\circ}C$, Verschueren 1983)

Molar Volume (cm^3/mol):

192.0 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

9.55 (Dean 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.480 (mp at $57.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

700 (Verschueren 1983)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($100^{\circ}C$, summary of literature data, temp range 100 – $275^{\circ}C$, Stull 1947)

1333* ($161.9^{\circ}C$, ebulliometry, measured range 161.9 – $275.0^{\circ}C$, Vonterres et al. 1955)

$\log (P/mmHg) = [-0.2185 \times 15397.8/(T/K)] + 9.015370$; temp range 100 – $275^{\circ}C$ (Antoine eq., Weast 1972–73)

$\log (P/mmHg) = [1 - 549.249/(T/K)] \times 10^{0.889463 - 4.72320 \times 10^{-4} \cdot (T/K) + 5.27654 \times 10^{-7} \cdot (T/K)^2}$; temp range 373.15 – $548.15 K$ (Cox eq., Chao et al. 1983)

2667, 13330 ($163^{\circ}C$, $206^{\circ}C$, Verschueren 1983)

$\log (P/kPa) = 5.50723 - 1137.035/(72.282 + t/^{\circ}C)$, temp range 161.9 – $275^{\circ}C$ (Antoine eq. from reported exptl. data of Vonterres et al. 1955, Boublik et al. 1984)

30.0 (interpolated-Antoine eq.-I, solid P_s , Stephenson & Malanowski 1987)

$\log (P_s/kPa) = 10.8635 - 4326.754/(T/K)$, temp range 291 – $314 K$ (Antoine eq.-I, solid, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 4.1553 - 547.8/(-298.55 + T/K)$, temp range 434 – $547 K$ (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.09 (Hansch & Leo 1979)

3.09 (COMPUTOX, Kaiser 1993)

3.06 (HPLC-RT correlation, Ritter et al. 1994)

3.09 (recommended, Sangster 1993)

3.06 (HPLC-RT correlation, Ritter et al. 1994)

3.09 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: photooxidation $t_{1/2} = 66\text{--}3840$ h in water, based on reported reaction rate constants for OH and RO_2 radicals to react with phenol class compounds (Mill & Mabey 1985; Guesten et al. 1981; quoted, Howard et al. 1991);

photooxidation $t_{1/2} = 0.1\text{--}22$ h, based on estimated reaction rate constant with OH radical (Atkinson 1987; quoted, Howard et al. 1991) and NO_3 radical in nighttime air to react with the phenol and cresol classes (Howard et al. 1991).

Hydrolysis:

Biodegradation: 100% degradation under aerobic and anaerobic conditions after 3 wk (504 h) at 22°C (Verschuereen 1983);

$t_{1/2}$ (aq. aerobic) = 24–168 h, based on a river die-away study in which a 50% degradation was observed over a one week period (Gonsior et al. 1984; quoted, Howard et al. 1991); $t_{1/2}$ (aq. anaerobic) = 96–672 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 0.1\text{--}22$ h, based on estimated reaction rate constant with OH radical (Atkinson 1987; quoted, Howard et al. 1991) and NO_3 radical in nighttime air to react with the phenol and cresol classes (Howard et al. 1991).

Surface water: photooxidation $t_{1/2} = 66\text{--}3840$ h in water, based on reported reaction rate constants for OH and RO_2 radicals to react with phenol class compounds (Mill & Mabey 1985; Güesten et al. 1981; quoted, Howard et al. 1991); $t_{1/2} = 24\text{--}168$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 48\text{--}336$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

FIGURE 14.1.1.22.1 Logarithm of vapor pressure versus reciprocal temperature for 2-phenylphenol.

14.1.1.23 4-Phenylphenol (4-Hydroxybiphenyl)

Common Name: 4-Phenylphenol

Synonym: *p*-phenylphenol, 4-hydroxybiphenyl, [1,1'-biphenyl]-4-ol

Chemical Name: 4-phenylphenol

CAS Registry No: 92-69-3

Molecular Formula: $C_{12}H_{10}O$, $C_6H_5C_6H_4OH$

Molecular Weight: 170.206

Melting Point ($^{\circ}C$):

166 (Lide 2003)

Boiling Point ($^{\circ}C$):

305–308 (sublimation, Weast 1982–83; Stephenson & Malanowski 1987)

305 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

192.0 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

9.55 (Dean 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, F: 0.0414 (mp at $166^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

9.79 (CESARS 1988)

56.4; 50.2 (quoted exptl.; calculated-group contribution, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1333* ($176.2^{\circ}C$, summary of literature data, temp range 176.2 – $308^{\circ}C$, Stull 1947)

1333* ($177.0^{\circ}C$, ebulliometry, measured range 177.0 – $308.0^{\circ}C$, Vonterres et al. 1955)

$\log(P/mmHg) = [-0.2185 \times 16974.3/(T/K)] + 9.234838$; temp range 176.2 – $308^{\circ}C$ (Antoine eq., Weast 1972–73)

$\log(P/mmHg) = [1 - 580.171/(T/K)] \times 10^{\{0.949514 - 5.554686 \times 10^{-4} \cdot (T/K) + 5.61184 \times 10^{-7} \cdot (T/K)^2\}}$; temp range: 450.15 – $581.15 K$, (Cox eq., Chao et al. 1983)

0.0278 (liquid, extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 7.97182 - 3214.349/(231.575 + t/^{\circ}C)$, temp range 177 – $308^{\circ}C$ (Antoine eq. from reported exptl. data of Vonterres et al. 1955, Boublik et al. 1984)

0.020 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 8.6575 - 3022.8/(216.1 + t/^{\circ}C)$; temp range: 177 – $308^{\circ}C$ (Antoine eq., Dean 1985, 1992)

0.00153 (extrapolated-Antoine eq., solid P_s , Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 11.17513 - 5066.004/(T/K)$; temp range 327 – $348 K$ (Antoine eq.-I, solid, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 8.41978 - 3684.9/(-5.81 + T/K)$, temp range 450 – $581 K$ (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.20 (shake flask-UV, Norrington et al. 1975)

3.63 (HPLC-RV correlation, Garst 1984)

2.88 (centrifugal partition chromatography (CPC), Terada et al. 1987)

3.20 (COMPUTOX databank, Kaiser 1993)

3.31 (HPLC-RT correlation, Ritter et al. 1994)

3.20 (recommended, Sangster 1993)

3.20 (recommended, Hansch et al. 1995)

2.60, 2.56, 2.70, 2.72 (HPLC- k' correlation, different combinations of stationary and mobile phases under isocratic conditions, Makovskaya et al. 1995a)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.2 CHLOROPHENOLS

14.1.2.1 2-Chlorophenol

Common Name: 2-Chlorophenol

Synonym: *o*-chlorophenol, 1-chloro-2-hydroxybenzene

Chemical Name: 2-chlorophenol

CAS Registry No: 95-57-8

Molecular Formula: $C_6H_4(OH)Cl$

Molecular Weight: 128.556

Melting Point ($^{\circ}C$):

9.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

174.9 (Dreisbach 1955; Weast 1982–83; Lide 2003)

Density (g/cm^3):

1.2634 ($20^{\circ}C$, Weast 1982–83)

1.257 ($25^{\circ}C$, Krijgsheld & van der Gen 1986)

Acid Dissociation Constant, pK_a :

8.65 (Farquharson et al. 1958; Saarikoski & Viluksela 1982; Renner 1990)

8.48 (Pearce & Simkins 1968; Krijgsheld & van der Gen 1986)

8.52 (Drahonovsky & Vacek 1971)

8.29 (Sillén & Martell 1971; Kaiser et al. 1984; Shigeoka et al. 1988)

8.55 (Serjeant & Dempsey 1979)

8.30 (Hoigné & Bader 1983)

9.30 (HPLC, Miyake et al. 1987)

Molar Volume (cm^3/mol):

101.8 ($20^{\circ}C$, Stephenson & Malanowski 1987)

124.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

40.05, 49.25 (normal bp, $25^{\circ}C$, Dreisbach 1955)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

13.50 (Dreisbach 1955)

10.75 (Tsonopoulos & Prausnitz 1971)

12.52 (Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

38.12 (Tsonopoulos & Prausnitz 1971)

44.24 (exptl., Chickos et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

25000* ($20^{\circ}C$, synthetic method, measured range -0.20 to $173.0^{\circ}C$, Sidgwick & Turner 1922)

29000 (20 – $25^{\circ}C$, Seidell 1941; Urano et al. 1982)

24650 ($20^{\circ}C$, shake flask-UV, Mully & Metcalf 1966)

22000 (shake flask-spectrophotometry, Roberts et al. 1977)

28500 ($20^{\circ}C$, Verschueren 1977, 1983)

11480 (shake flask-LSC, Banerjee et al. 1980)

11200 (shake flask-radioactive analysis, Veith et al. 1980)

20000 (recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

23260 (shake flask-HPLC/UV at pH 4.8, Ma et al. 1993)

28500 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)

22660* (24.6°C, shake flask-conductimetry, measured range 15.4–34.5°C, Achard et al. 1996)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

316* (interpolated-regression of tabulated data, temp range 12.7–174.5°C, Stull 1947)

208 (calculated-Antoine eq., Dreisbach 1955)

$\log(P/\text{mmHg}) = 7.05272 - 1589.1/(206.0 + t/^\circ\text{C})$, temp range 80–300°C (Antoine eq. for liquid state, Dreisbach 1955)

313 (extrapolated from Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 10341.1/(T/K)] + 7.952334$; temp range 12.1–174.5°C (Antoine eq., Weast 1972–73)

5532 (80°C, Verschueren 1977, 1983)

293, 180.7 (extrapolated, Antoine eq., Dean 1985)

$\log(P/\text{mmHg}) = 6.87731 - 1471.61/(193.17 + t/^\circ\text{C})$; temp range 80–200°C (Antoine eq., Dean 1985, 1992)

131.8 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 5.78693 - 1314.9/(-101.95 + T/K)$, temp range 333–449 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 5.3685 - 1096.98/(-122.58 + T/K)$; temp range 354–448 K (Antoine eq.-II, Stephenson & Malanowski 1987)

737, 1329, 2278, 3736, 5907 (50, 60.24, 69.94, 79.95, 89.94°C, calculated-Antoine eq. of Stephenson & Malanowski 1987, Tabai et al. 1997)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

1.065 (calculated-P/C, Mabey et al. 1982)

0.688 (calculated-P/C, Shiu et al. 1994)

0.661 (20°C, single equilibrium static technique SEST, Sheikheldin et al. 2001)

$k_H/\text{kPa} = 161.250 - 12658.0/(T/K) - 20.4027$; temp range 323–363 K (activity coefficient by ebulliometric method, Tabai et al. 1997)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.15 (shake flask-UV, Fujita et al. 1964;)

2.15, 2.19 (Leo et al. 1971)

2.20 (calculated using data from Fujita et al. 1964, Umeyama et al. 1971)

2.12 (20°C, shake flask, Korenman 1974)

2.15 (LC- k' correlation, Carson et al. 1975)

2.17 (Hansch & Leo 1979)

2.16 (shake flask-LSC, Banerjee et al. 1980)

0.83 (RP-HPLC-RT correlation, Veith et al. 1980)

2.11 (RP-HPLC-RT correlation, Butte et al. 1981)

2.03 (shake flask, Dearden & Bresnen 1981)

2.16 \pm 0.03 (HPLC- k' correlation, Hammers et al. 1982)

2.32 (RP-HPLC-RT correlation, Chin et al. 1986)

1.56, 1.99 (HPLC- k' correlation, Eadsforth 1986)

2.09 (HPLC-RT correlation, Miyake et al. 1986)

2.13 (shake flask-UV, Miyake et al. 1987)

2.16 (shake flask-CPC, Berthod et al. 1988)

2.24 (batch equilibration-UV, Beltrame et al. 1988)

2.11 (centrifugal partition chromatography, Gluck & Martin 1990)

2.25 (back flashing-CPC centrifugal partition chromatography; Menges et al. 1990)

2.05 (centrifugal partition chromatography CPC-RV, El Tayar et al. 1991)

2.17 (counter-current chromatography, Berthod et al. 1992)

2.15 (recommended, Sangster 1993)

2.29 (shake flask-GC, Kishino & Kobayashi 1994)

2.15 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

2.33	(bluegill sunfish, Barrows et al. 1980)
2.33	(bluegill sunfish, Veith et al. 1980)
1.61	(microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
2.33	(bluegill sunfish, Bysshe 1982)
0.81	(gold fish, Kobayashi et al. 1979; quoted, Verschueren 1983; Howard 1989)
0.81	(Isnard & Lambert 1988)
0.28–1.40	(estimated from K_{OW} , Howard 1989)

Sorption Partition Coefficient, log K_{OC} :

3.70, 3.60	(sediment: fine, coarse; Isaacson & Frink 1984)
1.86	(sediment-water, calculated- K_{OW} , Mabey et al. 1982)
1.71	(clay loam soil, Boyd 1982; quoted, Howard 1989)
3.69	(untreated fine sediment, Isaacson & Frink 1984)
3.60	(untreated coarse sediment, Isaacson & Frink 1984)
3.98	(treated fine sediment, Isaacson & Frink 1984)
4.36	(treated coarse sediment, Isaacson & Frink 1984)
1.20–2.55	(estimated from K_{OW} , Howard 1989)
1.82	(calculated- K_{OW} , Kollig 1993)
2.60	(soil, calculated-MCI χ , Sabljic et al. 1995)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 1.35, 1.60$ h from stirred and static water at 23.8°C (Chiou et al. 1980; Howard 1989);
 $t_{1/2} = 73$ d, based on estimation from a model river 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s (Howard 1989).

Photolysis: vapor phase $t_{1/2} = 47$ h (Howard 1989);

first-order photolysis disappearance rate constant $k = 3.01 \times 10^{-2} \text{ min}^{-1}$ in the absence of DOM at 313 nm (Kawaguchi 1992).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k(aq.) < 7 \times 10^5 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $1 \times 10^7 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

$k(aq.) = 66 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 8, $k = (1.1 \pm 0.3) \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for non-protonated species, $k = (0.2 \pm 0.1) \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ for phenolate ions for the reaction with ozone in water using 3 mM *t*-BuOH as scavenger at pH 1.8–4 and 20–23°C (Hoigné & Bader 1983b)

$k_{OH} = 1.3 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in air (Bunce et al. 1991)

$k(aq.) = (9.2 \pm 9.4) \times 10^6 \text{ M}^{-1} \text{ h}^{-1}$ for the reaction with singlet oxygen in aqueous phosphate buffer at $27 \pm 1^\circ\text{C}$ (Tratnyek & Hoigné 1991)

Hydrolysis:

Biodegradation: average rate $k = 25.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

time necessary for complete degradation of 16 mL in 14–25 d by wastewater (Haller 1978);

aerobic degradation in a non-sterile clay loam soil: 91% loss at 0°C after 8 d at the termination of the experiment, 94% loss at 4°C after 8 d and 100% loss at 20°C after 10–15 d all under same exptl. conditions (Baker et al. 1980);

rate constants $k = 1.0 \text{ d}^{-1}$ with $t_{1/2} = 0.7$ d in adopted activated sludge and $k = 0.3 \text{ d}^{-1}$ with $t_{1/2} = 2.3$ d in soil suspension under aerobic conditions (Mills et al. 1982);

completely degraded in soil suspensions in 14 d and by a soil microflora within 64 d (quoted, Verschueren 1983);

approximately 48 h in a column microcosm under aerobic conditions (Sufliata & Miller 1985);

degradation rate $k = 10^{-10} \text{ mol L}^{-1} \text{ d}^{-1}$ in freshwater and $k = 8^{-10} \text{ mol L}^{-1} \text{ d}^{-1}$ in saline water with acclimated sulfidogenic sediment cultures (Häggblom & Young 1990).

Biotransformation: rate constant for bacterial transformation of $1 \times 10^{-7} \text{ mL cell}^{-1} \text{ h}^{-1}$ in water (Mabey et al. 1982);

microbial transformation $k = (7.1 \pm 1.6) \times 10^{-11} \text{ L organism}^{-1} \text{ h}^{-1}$ (Paris et al. 1983; quoted, Steen 1991);

degradation $k = 3.49 \times 10^{-17} (\pm 38\% \text{ SD}) \text{ mol cell}^{-1} \text{ h}^{-1}$ from pure culture studies (Banerjee et al. 1984).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: half-life in the atmosphere was estimated to be 1.96 d (Howard 1989); tropospheric lifetime of 1 d, calculated based on reactions principally with OH radical on March 21 at 43°N (Bunce 1991).

Surface water: $t_{1/2} = 16.8$ d in sludge and $t_{1/2} = 55.2$ d in polluted river waters (Mills et al. 1982); rate constant of $(1.1 \pm 0.3) \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone at pH 1.8–4.0 (Hoigné & Bader 1983b); photolysis disappearance $k = 3.01 \times 10^{-2} \text{ min}^{-1}$ in the absence of DOM at 313 nm (Kawaguchi 1992).

Groundwater:

Sediment:

Soil: Days for complete disappearance by microbial decomposition in soil suspension: 14 d in Dunkirk silt loam, 47 d in Mardin silt loam (Alexander & Aleem 1961)

$t_{1/2} = 51$ d in a coarse sandy soil, $t_{1/2} = 110$ d in sandy loam (Kjeldsen et al. 1990)

$t_{1/2} = 7.2$ d in an acidic clay soil with < 1.0% organic matter and $t_{1/2} = 1.7$ d in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).

Biota: $t_{1/2} < 1$ d in tissue of bluegill sunfish (Barrows et al. 1980).

14.1.2.2 3-Chlorophenol

Common Name: 3-Chlorophenol

Synonym: *m*-chlorophenol, 1-chloro-3-hydroxybenzene

Chemical Name: 3-chlorophenol

CAS Registry No: 108-43-0

Molecular Formula: C₆H₄ClOH

Molecular Weight: 128.556

Melting Point (°C):

32.6 (Lide 2003)

Boiling Point (°C):

214.0 (Sidgwick & Turner 1922; Stull 1947; Weast 1982–83; Lide 2003)

Density (g/cm³, 20°C):

1.268 (25°C, Weast 1982–83)

Acid Dissociation Constant, pK_a:

9.12 (Farquharson et al. 1958; Renner 1990)

8.85 (Doedens 1967; Jones 1981; Bintein & Devillers 1994)

9.08 (Pearce & Simkins 1968)

8.78 (Sillén & Martell 1971; Kaiser et al. 1984; Shigeoka et al. 1988)

9.12 (Serjeant & Dempsey 1979; Howard 1989; Tratnyek & Hoigné 1991; Haderlein & Schwarzenbach 1993)

8.97 (Könemann 1981; Könemann & Musch 1981; Ugland et al. 1981; Renner 1990; Ma et al. 1993)

9.10 (Dean 1985; Schultz & Cajina-Quezada 1987)

9.02 (Krijgsheld & van der Gen 1986)

9.37 (quoted from Ugland et al. 1981, Lagas 1988)

Molar Volume (cm³/mol):

103.3 (45°C, Stephenson & Malanowski 1987)

124.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.72 (Tsonopoulos & Prausnitz 1971)

14.91; 15.6 (exptl.; calculated-group additivity method, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

38.2 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol·K), F: 0.842 (mp at 9.4°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

26000* (20°C, synthetic method, measured range –0.20 to 130.8°C, Sidgwick & Turner 1922)

26000 (20–25°C, Seidell 1941; Urano et al. 1982; Shigeoka et al. 1988)

22420 (20°C, Mulley & Metcalf 1966)

22000 (recommended, Horvath & Getzen 1985)

22190 (shake flask-HPLC/UV at pH 4.6, Ma et al. 1993)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

41.90* (extrapolated-regression of tabulated data, temp range 44.2–214°C, Stull 1947)

41.40 (extrapolated-Antoine eq., liquid value, Weast 1972–73)

log (P/mmHg) = [–0.2185 × 11979.7/(T/K)] + 8.276287; temp range 44.2–214°C (Antoine eq., Weast 1972–73)

667.0 (72°C, Verschueren 1983)

1.034 (extrapolated-Antoine eq.-I, solid, Stephenson & Malanowski 1987)

$\log (P_s/\text{kPa}) = 7.61412 - 3178.132/(T/\text{K})$, temp range 252–293 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)

33.40 (extrapolated-Antoine eq., supercooled liquid P_L , Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.54908 - 1978.86/(-51.572 + T/\text{K})$, temp range 317–487 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$):

0.0567 (calculated, Hine & Mookerjee 1975)

0.2045 (calculated-P/C, Shiu et al. 1994)

$k_H/\text{kPa} = 22.0921 - 6444.46/(T/\text{K})$; temp range 323–363 K (activity coefficient by ebulliometric method, Tabai et al. 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.50 (shake flask-UV, Fujita et al. 1964)

2.55 (calculated using data from Fujita et al. 1964, Umeyama et al. 1971)

2.52 (shake flask-UV, Korenman 1974)

2.17, 2.29 (calculated- π const., calculated-fragment const., Rekker 1977)

2.50 (Hansch & Leo 1979)

2.33 (HPLC- k' correlation, Butte et al. 1981, Butte et al. 1987)

2.44 (Dearden & Bresnen 1981)

2.36 (HPLC- k' correlation, Hammers et al. 1982)

2.55 (RP-HPLC- k' correlation, Miyake & Terada 1982)

1.87, 2.29 (HPLC- k' correlation, Eadsforth 1986)

2.36 (HPLC-RT correlation, Miyake et al. 1986)

2.55 (batch equilibration-UV, Beltrame et al. 1988)

2.50 (RP-HPLC-capacity ratio correlation, Minick et al. 1988)

2.48 (RP-HPLC, Shigeoka et al. 1988)

2.43; 2.63 (shake flask, HPLC-RT correlation, Wang et al. 1989)

2.50 (recommended, Sangster 1993)

2.64 (shake flask-GC, Kishino & Kobayashi 1994)

2.50; 2.57 (HPLC-RT correlation, electrometric titration, Slater et al. 1994)

2.50 (recommended, Hansch et al. 1995)

2.60 (solid-phase microextraction, Dean et al. 1996)

Bioconcentration Factor, $\log \text{BCF}$:

1.30 (Golden ide, Freitag et al. 1985)

1.25 (zebrafish, Butte et al. 1987)

0.845, 1.23 (earthworms *e. fetida andrei*: Kooyenberg soil, Holten soil, van Gestel & Ma 1988)

2.01, 2.09 (earthworms *I. rubellus*: Kooyenberg soil, Holten soil, van Gestel & Ma 1988)

1.17–2.55 (estimated from K_{OW} , Howard 1989)

1.00, 1.32, 2.17, 2.18 (earthworm system, from literature, Connell & Markwell 1990)

1.10, 1.40, 10.1, 16.3 (earthworm system, derived data, Connell & Markwell 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

1.20–2.74 (estimated from K_{OW} , Howard 1989)

2.54 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} \sim 73$ d for evaporation from a model river of 1 m deep, flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1989).

Photolysis: vapor phase $t_{1/2} = 1.96$ d (Howard 1989);

measured pseudo-first-order reaction $k = 0.048 \pm 0.001 \text{ min}^{-1}$ for direct photolysis in aqueous solutions (Peijnenburg et al. 1992).

Oxidation: rate constant $k = (5.4 \pm 1.0) \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen in aqueous phosphate buffer at $27 \pm 1^\circ\text{C}$ (Tratnyek & Hoigné 1991).

Hydrolysis: will not be an important degradation process (Howard 1989).

Biodegradation: 95% degradation in 3–6 d in mixed bacteria cultures (Tabak et al. 1964);

completely degraded in soil suspensions within 72 d and by a soil microflora within 64 d (quoted, Verschuieren 1983);

time necessary for complete degradation of 16 mg/L in 14–25 d by wastewater (Haller 1978); degradation rate of $15 \text{ -mol L}^{-1} \text{ d}^{-1}$ in freshwater and $18 \text{ }\mu\text{mol L}^{-1} \text{ d}^{-1}$ in saline water with acclimated sulfidogenic sediment cultures (Hägglom & Young 1990).

Biotransformation: degradation rate of $4.32 \times 10^{-17} (\pm 47\% \text{ SD}) \text{ mol cell}^{-1} \text{ h}^{-1}$ from pure culture studies (Banerjee et al. 1984).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: vapor phase half-life was estimated to be 1.96 d (Howard 1989).

Surface water: $t_{1/2} = (14.5 \pm 0.3) \text{ min}$ for direct photolysis in aqueous solutions (Peijnenburg et al. 1992).

Ground water:

Sediment: half-life was approximately 30 d in sediment from a farm stream at 20°C (Howard 1989).

Soil: Days for complete disappearance by microbial decomposition in soil suspension: 72 + d in Dunkirk silt loam, 47 + d in Mardin silt loam (Alexander & Aleem 1961)

disappearance $t_{1/2} = 2.5 \text{ d}$ from Kooyenburg soil, $t_{1/2} = 5.4 \text{ d}$ from Holten soil with earthworms *e. fetida andrei* and $t_{1/2} = 2.6 \text{ d}$ from Kooyenburg soil, $t_{1/2} = 2.1 \text{ d}$ from Holten soil with earthworms *I. rubellus* (van Gestel & Ma 1988);

$t_{1/2} = 15.1 \text{ d}$ in an acidic clay soil with $< 1.0\%$ organic matter and $t_{1/2} = 21.8 \text{ d}$ in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).

Biota:

TABLE 14.1.2.2.1

Reported aqueous solubilities and vapor pressures of 3-chlorophenol at various temperatures

14.1.2.3 4-Chlorophenol

Common Name: 4-chlorophenol

Synonym: *p*-chlorophenol, 1-chloro-4-hydroxybenzene

Chemical Name: 4-chlorophenol

CAS Registry No: 106-48-9

Molecular Formula: $\text{ClC}_6\text{H}_4\text{OH}$

Molecular Weight: 128.556

Melting Point ($^{\circ}\text{C}$):

42.8 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

220 (Lide 2003)

Density (g/cm^3 at 20°C):

1.2651 (Weast 1982–83)

Acid Dissociation Constant, pK_a :

9.37 (Farquharson et al. 1958; Ugland et al. 1981; Saarikoski & Viluksela 1982; Renner 1990)

9.18 (Doedens 1967)

9.42 (Pearce & Simkins 1968)

9.14 (Sillén & Martell 1971; Kaiser et al. 1984; Shigeoka et al. 1988; Argese et al. 1999)

9.41 (Serjeant & Dempsey 1979)

9.38 (Paris et al. 1982; Krijgsheld & van der Gen 1986)

9.20 (Hoigné & Bader 1983)

9.43 (Dean 1985; Schultz & Cajina-Quezada 1987)

9.37 ± 0.01 (potentiometric partition, Hersey et al. 1989)

9.57 ± 0.01 (UV with pH profile, Hersey et al. 1989)

Molar Volume (cm^3/mol):

101.6 (40°C , Stephenson & Malanowski 1987)

124.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

14.69 (Tsonopoulos & Prausnitz 1971)

14.07; 16.2 (exptl.; calculated-group additivity method, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

46.44 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$, F : 0.669 (mp at 42.8°C)

Water Solubility (g/m^3 or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

27000* (20°C , synthetic method, measured range -0.20 to 128.7°C , Sidgwick & Turner 1922)

27000 (20 – 25°C , Seidell 1941; Urano et al. 1982)

27000 (shake flask-UV at pH 5.1, Blackman et al. 1955)

26250 (20°C , shake flask-UV, Mulley & Metcalf 1966)

24000 (shake flask-spectrophotometry, Roberts et al. 1977)

27000 (recommended, Horvath & Getzen 1985)

26390 (shake flask-HPLC/UV at pH 4.6, Ma et al. 1993)

25540* (25.2°C , shake flask-conductimetry, measured range 15.1 – 34.5°C , Achard et al. 1996)

20712* (11.05°C , shake flask-optical method, measured range 282.2 – 386.1 K , Jaoui et al. 1999)

25519* (24.85°C , shake flask-optical method, measured range 298 – 341.9 K , Jaoui et al. 2002)

$\ln [\text{S}/(\text{mol kg}^{-1})] = 5.6451 - 716.81/(T/\text{K})$; temp range 282 – 342 K (eq. derived using reported exptl. data, Jaoui et al. 2002)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 28.6* (extrapolated-regression of tabulated data, temp range 49.8–220°C, Stull 1947)
- 28.0 (extrapolated-Antoine eq., liquid value, Weast 1972–73)
- $\log (P/\text{mmHg}) = [-0.2185 \times 12281.6/(T/K)] + 8.331937$; temp range 49.8–220°C (Antoine eq., Weast 1972–73)
- 13.3, 33.3 (20°C, 30°C, Verschueren 1977, 1983)
- 3.47 (extrapolated liquid value, Antoine eq., Stephenson & Malanowski 1987)
- $\log (P_L/\text{kPa}) = 8.83238 - 1385.1/(-131.1 + T/K)$, temp range 373–493 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa·m³/mol at 25°C and reported temperature dependence equations):

- 0.0567 (calculated, Hine & Mookerjee 1975; Howard 1989)
- 0.0471 (calculated-P/C, Leuenberger et al. 1985)
- 0.0952 (calculated-P/C, Shiu et al. 1994)
- $k_H/\text{kPa} = 2017.07 - 110385.0/(T/K) - 290.078$; temp range 323–363 K (activity coefficient by ebulliometric method, Tabai et al. 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 2.39 (shake flask-UV, Fujita et al. 1964)
- 2.53 (shake flask-UV at pH 7.45, Umeyama et al. 1971)
- 2.37 (HPLC-RT correlation, Carlson et al. 1975)
- 2.40 (HPLC-RT correlation, Mirrlees et al. 1976)
- 2.17, 2.29 (calculated- π const., calculated-fragment const., Rekker 1977)
- 2.35, 2.39, 2.44, 2.40 (lit. values, Hansch & Leo 1979)
- 2.51 (calculated- π const. or fragment const., McLeese et al. 1979)
- 2.55 (20°C, shake flask-UV, Rogers & Wong 1980)
- 2.35 (HPLC- k' correlation, Hammers et al. 1982)
- 2.51 (RP-HPLC- k' , correlation Miyake & Terada 1982)
- 2.46 ± 0.06 (HPLC-RV correlation.-ALPM, Garst & Wilson 1984)
- 2.88 (CPC-RV, Terada et al. 1987)
- 2.43 (batch equilibration-UV, Beltrame et al. 1988, Beltrame et al. 1989)
- 2.39 (RP-HPLC-capacity ratio, Minick et al. 1988)
- 2.41 (shake flask, Shigeoka et al. 1988)
- 2.42; 2.46; 2.34, 2.45 (filter chamber-UV; potentiometric partition; Hersey et al. 1989)
- 2.52; 2.59 (shake flask; HPLC-RT correlation, Wang et al. 1989)
- 2.39 (recommended, Sangster 1993)
- 2.63 (shake flask-GC, Kishino & Kobayashi 1994)
- 2.41; 2.45 (HPLC-RT correlation, electrometric titration, Slater et al. 1994)
- 2.39 (recommended, Hansch et al. 1995)
- 1.82, 1.83, 2.01, 1.98 (HPLC- k' correlation, different combinations of stationary and mobile phases under isocratic conditions, Makovskaya et al. 1995a)

Bioconcentration Factor, $\log BCF$:

- 1.18 (goldfish, Kobayashi et al. 1979)
- 0.30–1.59 (estimated from K_{OW} , Howard 1989)
- 1.05–1.50 (estimated, NCASI 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

- 1.85 (clay loam soil, Boyd 1982; Howard 1989)
- 1.20–2.68 (estimated from K_{OW} , Howard 1989)
- 2.377, 2.686, 2.025, 2.222, 2.332 (soils, first generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV, Gawlik et al. 1998)
- 2.142, 1.966, 1.966, 2.289, 1.952 (soils, second generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV and HPLC- k' correlation, Gawlik et al. 2000)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: half-lives of 12.8 h, 17.4 h for evaporation from stirred and static water at a depth of 0.38 cm at 23.6°C (Chiou et al. 1980; Howard 1989); $t_{1/2} = 73$ d was estimated for evaporation from a river 1 m deep, flowing at 1 m/s with a wind velocity of 3 m/s (Howard 1989).

Photolysis:

photo-transformation rate constants: $k = 0.011 \text{ h}^{-1}$ with $t_{1/2} = 63$ h for distilled water in summer (mean temp 25°C) and $k = 0.007 \text{ h}^{-1}$ with $t_{1/2} = 99$ h in winter (mean temp 14°C); $k = 0.03 \text{ h}^{-1}$ with $t_{1/2} = 28$ h for estuarine water in summer and $k = 0.011 \text{ h}^{-1}$ with $t_{1/2} = 63$ h in winter exposed to full sunlight and microbes (Hwang et al. 1986)

photo-mineralization rate constants: $k = 0.012 \text{ h}^{-1}$ with $t_{1/2} = 58$ d for distilled water in summer and $k = 0.003 \text{ h}^{-1}$ with $t_{1/2} = 224$ d in winter; $k = 0.07 \text{ h}^{-1}$ with $t_{1/2} = 10$ d in summer and $k = 0.007 \text{ h}^{-1}$ with $t_{1/2} = 95$ d in winter for surface estuarine water exposed to full sunlight and microbes (Hwang et al. 1986);

photo-degradation $k = 564 \times 10^3 \text{ min}^{-1}$ with $t_{1/2} = 1.1$ min for direct UV radiation in aqueous solutions (Benitez et al. 2000).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k(\text{aq.}) = (600 \pm 100) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water using 1 mM PrOH as scavenger at pH 2 and 20–23°C (Hoigné & Bader 1983a)

$k(\text{aq.}) = 34 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 8, and $k = (600 \pm 100) \text{ M}^{-1} \text{ s}^{-1}$ for non-protonated species, $k = (0.6 \pm 0.2) \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ for phenolate ions for the reaction with ozone in water using 3 mM *t*-BuOH as scavenger at pH 1.5–6 and 20–23°C (Hoigné & Bader 1983b)

$k(\text{aq.}) = (6.0 \pm 3.6) \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen in aqueous buffer at $27 \pm 1^\circ\text{C}$ (Tratnyek & Hoigné 1991)

72.1 mg/L total organic carbon (TOC) degraded to 98% TOC after 5 h illumination with 250 watt tungsten lamp by the photo-Fenton reaction (Ruppert et al. 1993)

$k = 1877 \times 10^3 \text{ min}^{-1}$ with a half-life of 0.4 min for reaction with Fenton's reagent; $k_{\text{O}_3} = 17 \times 10^3 \text{ min}^{-1}$ with a half-life of 38.15 min at pH 2; and $k_{\text{O}_3} = 239 \times 10^3 \text{ min}^{-1}$ with a half-life of 3.4 min at pH 9 for reactions with ozone in aqueous solutions (Benitez et al. 2000)

Hydrolysis:

Biodegradation: 95% degradation in 3–6 d in a mixed bacteria cultures (Tabak et al. 1964);

average rate of biodegradation $11.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

time necessary for complete degradation of 16 mg/L in 7–14 d by wastewater and in 14–25 d by soil (Haller 1978);

$t_{1/2} = 475$ h in river waters with a calculated first-order $k = 0.035 \text{ d}^{-1}$ (Lee & Ryan 1979; quoted, Battersby 1990); aerobic degradation in a non-sterile clay-loam soil: 77% loss at 0°C at the termination of the experiment after 14 d, 84% loss at 4°C after 12 d and 100% loss at 20°C after 30 d all under same experimental conditions (Baker et al. 1980);

$t_{1/2} = 216$ –480 h and 72–1080 h for 75% degradation in mineral medium and seawater (de Kreuk & Hanstveit 1981);

biodegradation first order rate constant $k = 0.23 \text{ d}^{-1}$ in aquatic systems (Scow 1982);

completely degraded in soil suspensions in 9 d and by a soil microflora in 16 d (quoted, Verschueren 1983);

microbial degradation is the primary transformation process; transformation $k = 0.06 \text{ h}^{-1}$ with $t_{1/2} = 11$ h for estuarine water in summer and $t_{1/2} = 0.006 \text{ h}^{-1}$ with $t_{1/2} = 116$ h in winter in the darkness (Hwang et al. 1986) mineralization $k = 0.293 \text{ h}^{-1}$ with $t_{1/2} = 2$ d for estuarine water in summer and $k = 0.003 \text{ h}^{-1}$ with $t_{1/2} = 231$ d in winter in the darkness (Hwang et al. 1986); degradation rate constants $k = 0.035 \text{ d}^{-1}$ with $t_{1/2} = 480$ d in Skidway River water and 0.23 d^{-1} with a half-life of 72 h in Skidway River water-sediment slurry (Pritchard 1987); degradation rate constant of $37 \mu\text{mol L}^{-1} \text{ d}^{-1}$ in freshwater and $22 \mu\text{mol L}^{-1} \text{ d}^{-1}$ in saline water with acclimated sulfidogenic sediment cultures (Häggblom & Young 1990);

average transformation rate of $53 \mu\text{mol L}^{-1} \text{ d}^{-1}$ at 31°C for anaerobic degradation in freshwater sediments with an average adaptation time of 37 d (Zhang & Wiegel 1990);

70% degradation within 1–2 d in soil and completely degraded within 15 d in river water (NCASI 1992)

Degradation constant $k = 8.5 \mu\text{M/h}$ for aerobic dechlorination in shake flask experiments;; $k = 10 \mu\text{M/h}$ in the sequential anaerobic-aerobic continuous reactor system (Armenante et al. 1999).

Biotransformation: microbial transformation rate constant of $(1.7 \pm 0.9) \times 10^{-12}$ L organism⁻¹ h⁻¹ (Paris et al. 1982); microbial transformation rate constant of $(4.7 \pm 1.6 \times 10^{-11}$ L organism⁻¹ h⁻¹ to $(9.0 \pm 1.7) \times 10^{-11}$ L organism⁻¹ h⁻¹ in pond and river samples at five different sites (Paris et al. 1983); degradation rate $k = 5.44 \times 10^{-17}$ ($\pm 32\%$ SD) mol cell⁻¹ h⁻¹ from pure culture studies and 0.3×10^{-12} mol cell⁻¹ h⁻¹ with microorganisms in Seneca River waters (Banerjee et al. 1984).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 1.96$ d in the atmosphere (Howard 1989)

Surface water: $t_{1/2} = 475$ h for biodegradation in river waters with a calculated first-order rate constant of 0.035 d⁻¹ (Lee & Ryan 1979; quoted, Battersby 1990);

$t_{1/2} = 216$ –624 h and 72–1080 h for 75% degradation in mineral medium and seawater, respectively (de Kreuk & Hanstveit 1981);

rate constant $k = 600 \pm 100$ M⁻¹ s⁻¹ for the reaction with ozone at pH 1.5–6.0 (Hoigné & Bader 1983);

$t_{1/2} = 63$ h in summer at season temp., 25°C, $t_{1/2} = 99$ h in winter at season temp., 14°C in distilled water and 28 h in summer, $t_{1/2} = 63$ h in winter in estuary surface water, based on photo-transformation rate (Hwang et al. 1986);

$t_{1/2} = 58$ d in summer, $t_{1/2} = 224$ d in winter in distilled water; and $t_{1/2} = 10$ d in summer, $t_{1/2} = 95$ d in winter in surface estuarine water, based on photo-mineralization rate (Hwang et al. 1986);

$t_{1/2} = 216$ h at 21°C in Skidway River water (Pritchard 1987);

$t_{1/2} = 20$ d in water (Howard 1989);

at a concentration of 1 mg/L, 4-CP was degraded completely within 15 d in river waters (NCASI 1992);

photo-oxidation $t_{1/2} = 0.4$ min for reaction with Fenton's reagent; $t_{1/2} = 38.15$ min at pH 2, and $t_{1/2} = 3.4$ min at pH 9 for reactions with ozone in aqueous solutions (Benitez et al. 2000).

Ground water:

Sediment: $t_{1/2} = 72$ h at 22°C in Skidway River water-sediment slurry (Pritchard 1987);

$t_{1/2} = 3$ d in sediment and seawater (Howard 1989).

Soil: Days for complete disappearance by microbial decomposition in soil suspension: 9 d in Dunkirk silt loam, 3 d in Mardin silt loam (Alexander & Aleem 1961)

$t_{1/2} = 2.5$ d in an acidic clay soil with < 1.0% organic matter and $t_{1/2} = 1.0$ d in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992);

70% degradation with 1 to 2 d (NCASI 1992).

Biota:

14.1.2.4 2,4-Dichlorophenol

Common Name: 2,4-Dichlorophenol

Synonym: 2,4-DCP

Chemical Name: 2,4-dichlorophenol

CAS Registry No: 120-83-2

Molecular Formula: $C_6H_4Cl_2O$, $C_6H_3Cl_2OH$

Molecular Weight: 163.001

Melting Point ($^{\circ}C$):

45.0 (Stull 1947; Verschuereen 1977, 1983; Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

210.0 (Stull 1947; Verschuereen 1977, 1983; Weast 1982–83; Lide 2003)

Density (g/cm^3):1.383 (at 60/ $25^{\circ}C$, Verschuereen 1983)Acid Dissociation Constant, pK_a :

7.80 (Blackman et al. 1955; Hoigné & Bader 1983; Scully & Hoigné 1987)

7.85 (Farquharson et al. 1958; Pearce & Simkins 1968)

7.68 (Doedens 1967)

7.89 (Sillén & Martell 1971; Serjeant & Dempsey)

8.01, 8.04, 8.09 (measured values, Xie & Dyrssen 1984)

8.09 (Shigeoka et al. 1988)

Molar Volume (cm^3/mol):

145.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

20.09; 16.7 (exptl.; calculated-group additivity method, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.636 (mp at $45^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

4500 (gravimetric, Mosso 1887)

6194 (shake flask-UV at pH 5.1, Blackman et al. 1955)

5000 (shake flask-spectrophotometry, Roberts et al. 1977)

2650 (shake flask-GC, Jones et al. 1977/1978)

4600 ($20^{\circ}C$, Verschuereen 1977, 1983)

5547 (shake flask-HPLC/UV at pH 5.1, Ma et al. 1993)

4600 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)

5517* ($25.2^{\circ}C$, shake flask-conductimetry, measured range 15.3 – $35.1^{\circ}C$, Achard et al. 1996)6339* ($37.35^{\circ}C$, shake flask-optical method, measured range 310.5 – $423.2 K$, Jaoui et al. 1999)

4980 (shake flask-HPLC/UV, pH 4.98, Huang et al. 2000)

4841* ($21.45^{\circ}C$, shake flask-optical method, measured range 296.4 – $337.7 K$, Jaoui et al. 2002)

$\ln [S/(mol kg^{-1})] = 11.846 - 3025.1/(T/K)$; temp range 288 – $298 K$ (eq.-I derived using reported exptl. data, Jaoui et al. 2002)

$\ln [S/(mol kg^{-1})] = 5.0497 - 981.37/(T/K)$; temp range 298 – $347 K$ (eq.-II derived using reported exptl. data, Jaoui et al. 2002)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 20.6* (extrapolated-regression of tabulated data, temp range 53–210°C, Stull 1947)
- 11.9 (extrapolated-Antoine eq., Weast 1972–73)
- $\log(P/\text{mmHg}) = [-0.2185 \times 13230.4/(T/K)] + 8.884810$; temp range 53–210°C (Antoine eq., Weast 1972–73)
- 18.0 (supercooled liquid value, GC-RT correlation, Hamilton 1980)
- 15.4 (capillary GC-RT, Bidleman & Renberg 1985)
- 2.40, 11.87 (8°C, 25°C, extrapolated, Leuenberger et al. 1985)
- $\log(P_L/\text{kPa}) = 6.75941 - 1945.1/(-73.987 + T/K)$; temp range 326–483 K (Antoine eq.-I, Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 6.32554 - 1807.32/(-69.17 + T/K)$; temp range 391–474 K (Antoine eq.-II, Stephenson & Malanowski 1987)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

- 0.284 (calculated-P/C, Mabey et al. 1982)
- 0.110 (8°C, calculated-P/C, Leuenberger et al. 1985)
- 0.435 (calculated-P/C, Shiu et al. 1994)
- $k_H/\text{kPa} = 24.9070 - 6791.07/(T/K)$; temp range 323–363 K (activity coefficient by ebulliometric method, Tabai et al. 1997)
- 0.292 (20°C, single equilibrium static technique SEST, Sheikheldin et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 3.08 (Leo et al. 1971)
- 3.06 (shake flask-UV, Stockdale & Selwyn 1971)
- 3.06, 3.08 (Hansch & Leo 1979)
- 2.92 (HPLC- k' correlation, Hammers et al. 1982)
- 3.14 (RP-HPLC- k' correlation, Miyake & Terada 1982)
- 3.41 (shake flask-UV, Beltrame et al. 1984)
- 3.23 (shake flask-HPLC/UV, Schellenberg et al. 1984)
- 3.20, 3.17, 3.17 (20°C, shake flask-GC-calculated-regression, Xie & Dyrssen 1984)
- 3.21, 3.23 (shake flask-GC, HPLC- k' correlation, Xie et al. 1984)
- 3.23 (OECD 1981 guidelines, Leuenberger et al. 1985)
- 2.87 (RP-HPLC-RT correlation, Chin et al. 1986)
- 2.97 (HPLC-RT correlation, Miyake et al. 1986)
- 3.61 (centrifugal partition chromatography CPC-RV, Terada et al. 1987)
- 3.21 (shake flask, Shigeoka et al. 1988; quoted, Saito et al. 1993)
- 3.16 (shake flask/batch equilibrium-UV, Beltrame et al. 1988)
- 3.06 (EPA CLOGP Data Base, Hulzebos et al. 1993)
- 3.17 (recommended, Sangster 1993)
- 3.07 (calculated-QSAR, Kollig 1993)
- 3.20 (shake flask-GC, Kishino & Kobayashi 1994)
- 3.06 (recommended, Hansch et al. 1995)
- 3.34 (solid-phase microextraction; Dean et al. 1996)

Bioconcentration Factor, $\log BCF$:

- 1.53 (goldfish, Kobayashi 1979)
- 1.00 (trout, Hattula et al. 1981)
- 2.27 (microorganism-water, calculated- K_{OW} , Mabey et al. 1982)
- 2.00 (golden ide, after 3 d, Freitag et al. 1985)
- 2.42 (algae, after 1 d, Freitag et al. 1985)
- 2.53 (activated sludge, after 5 d, Freitag et al. 1985)
- 1.00 (quoted, brown trout, Walden et al. 1986)
- 1.80 (correlated, Isnard & Lambert 1988)
- 1.41–1.65 (estimated, NCASI 1992)

Sorption Partition Coefficient, log K_{OC} :

- 2.59 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 2.59–3.02 (soil, calculated- K_{OW} , model of Karickhoff et al. 1979, Sabljic 1987a,b)
 2.89–3.12 (soil, calculated- K_{OW} , model of Kenaga & Goring 1980, Sabljic 1987a,b)
 2.10–2.32 (soil, calculated- K_{OW} , model of Briggs 1981, Sabljic 1987a,b)
 2.48–2.91 (soil, calculated- K_{OW} , model of Means et al. 1982, Sabljic 1987a,b)
 1.74–2.13 (soil, calculated- K_{OW} , model of Chiou et al. 1983, Sabljic 1987a,b)
 3.60, 3.50 (untreated fine and coarse sediment, Isaacson & Frink 1984)
 3.71, 3.98 (treated fine and coarse sediment, Isaacson & Frink 1984)
 2.75 (sediment, Schenllenberg et al. 1984; quoted, Sabljic 1987a,b)
 2.76 (soil, calculated-MCI χ , Sabljic 1987a,b)
 2.49 (calculated- K_{OW} , Kollig 1993)
 2.75 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 2.47, 2.53 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)
 2.609, 2.654, 2.460, 2.346, 2.540 (second generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV and HPLC- k' correlation, Gawlik et al. 2000)
 2.49, 2.57, 2.77, 2.33 (soils: organic carbon OC -0.1% and pH 2.0–7.4, OC -0.1% and pH \leq 5.8, OC -0.5%, $0.1 \leq$ OC < 0.5%, average, Delle Site 2001)

Environmental Fate Rate Constants and Half-Lives:

Volatilization:

photolysis:

$k_p = 0.82 \text{ h}^{-1}$ with $t_{1/2} = 0.8 \text{ h}$ for distilled water in summer at mean temp. 25°C , and $k_p = 0.21 \text{ h}^{-1}$ with $t_{1/2} = 3 \text{ h}$ in winter at mean temp. 11°C ; $k_p = 1.16 \text{ h}^{-1}$ with $t_{1/2} = 0.6 \text{ h}$ for estuarine water in summer and $k_p = 0.44 \text{ h}^{-1}$ with $t_{1/2} = 2 \text{ h}$ in winter; $k_p = 1.0 \text{ h}^{-1}$ with $t_{1/2} = 0.7 \text{ h}$ in summer and $k_p = 0.38 \text{ h}^{-1}$ with $t_{1/2} = 2 \text{ h}$ in winter for poisoned estuarine water when exposed to full sunlight and microbes (photo-transformation, Hwang et al. 1986)

$k_p = 0.09 \text{ h}^{-1}$ with $t_{1/2} = 8 \text{ d}$ in summer and $k_p = 0.049 \text{ h}^{-1}$ with $t_{1/2} = 14 \text{ d}$ in winter for distilled water; $k_p = 0.20 \text{ h}^{-1}$ with $t_{1/2} = 4 \text{ d}$ in summer and $k_p = 0.04 \text{ h}^{-1}$ with $t_{1/2} = 17 \text{ d}$ in winter for estuarine water; $k_p = 0.12 \text{ h}^{-1}$ with $t_{1/2} = 6 \text{ d}$ in summer and $k_p = 0.05 \text{ h}^{-1}$ with $t_{1/2} = 14 \text{ d}$ in winter for poisoned estuarine water when exposed to full sunlight and microbes (photo-mineralization rate, Hwang et al. 1986)

photochemical-transformation $t_{1/2} = 2.5$ – 2.6 h in Xenotest 1200 (Svenson & Björndal 1988)

atmospheric and aqueous photolysis $t_{1/2} = 0.8$ – 3 h based on measured rate of photolysis in distilled water under sunlight in summer and winter (Howard et al. 1991)

$k_p = 38 \times 10^3 \text{ min}^{-1}$ with a $t_{1/2} = 17.5 \text{ min}$ for direct UV radiation aqueous solutions (Benitez et al. 2000)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k < 7 \times 10^5 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen, and $1 \times 10^7 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

$k = 5 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 8, $k < 1.5 \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for non-protonated species, $k = (8 \pm 4) \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ for phenolate ions for the reaction with ozone in water using 3 mM *t*-BuOH as scavenger at pH 1.3–1.5 and 20 – 23°C (Hoigné & Bader 1983b)

$k = 7 \times 10^5 \text{ M}^{-1} \text{ s}^{-1}$ at pH 5.5, $k = 2 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 6.0, $k = 10 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 6.6, $k = 15 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 7.0, $k = 76 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 7.9, $k = 120 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 9.0 and pH 9.6 for the reaction with singlet oxygen in water at $19 \pm 2^\circ\text{C}$ (Scully & Hoigné 1987)

$k_{OH} = 1.06 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1989)

$k_{OH} = 3.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Bunce et al. 1991)

$k = (5.1 \pm 4.7) \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen in aqueous phosphate buffer at $27 \pm 1^\circ\text{C}$ (Tratnyek & Hoigné 1991)

$k_{OH}(\text{calc}) = 1.71 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital estimation method, Klamt 1993)

$k = 209 \times 10^3 \text{ min}^{-1}$ with a half-life of 2.4 min for reaction with Fenton's reagent; and $k = 24 \times 10^3 \text{ min}^{-1}$ with a half-life of 30.4 min at pH 2, and $k = 315 \times 10^3 \text{ min}^{-1}$ with a half-life of 3.3 min at pH 9 for reactions with ozone in aqueous solutions (Benitez et al. 2000)

Hydrolysis: no hydrolyzable groups (Howard et al. 1991).

Biodegradation: 7 to 10 d for bacteria to utilize 95% of 200 ppm in parent substrate (Tabak et al. 1964);

aqueous aerobic $t_{1/2} = 66.7\text{--}199$ h, based on aerobic lake die-away test data (Aly & Faust 1964; selected, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 324\text{--}1032$ h, based on anaerobic lake die-away test data (Aly & Faust 1964; selected, Howard et al. 1991);

completely degraded in soil suspensions in 9 d (Woodcock 1971; quoted, Verschueren 1983);

average rate of biodegradation $10.5 \text{ mg COD g}^{-1} \text{ h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20-d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

aerobic degradation in a non-sterile clay-loam soil: 79% loss at 0°C at the termination of the experiment after 14 days, 82% loss at 4°C after 12 d and 84% loss at 20°C after 40 d all under same experimental conditions (Baker et al. 1980);

rate constants $k = 0.5 \text{ d}^{-1}$ with $t_{1/2} = 1.4$ d in adapted activated sludge and $k = 0.1 \text{ d}^{-1}$ with $t_{1/2} = 6$ d in natural waters under anaerobic conditions (Mills et al. 1982);

microbial degradation negligible in darkness (Hwang et al. 1986);

$k = 0.223 \text{ h}^{-1}$ for maximum removal by activated sludge microorganisms (Chudoba et al. 1989);

biodegradation first-order rate of hydroxylation, $k = 0.017 \text{ min}^{-1}$ by *pseudomonas putida* Fl (Spain et al. 1989; quoted, Neilson et al. 1991);

15% reduction in concn ($2 \mu\text{M}$) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)

transformation rate of $245 \text{ -mol L}^{-1} \text{ d}^{-1}$ at 31°C for anaerobic degradation in freshwater sediments with an average of 7 d adaptation time (Zhang & Wiegel 1990);

complete biodegradation in water, seawater, sludge and lagoon within 16 to 23 d (NCASI 1992).

Degradation constant $k = 1.6 \mu\text{M/h}$ for anaerobic batch experiment in serum bottles; $k = 1.2 \mu\text{M/h}$ for dechlorination in anaerobic batch or continuous bioreactor; $k = 1.9 \mu\text{M/h}$ in the sequential anaerobic-aerobic continuous reactor system (Armenante et al. 1999)

Biotransformation: for bacterial transformation $k = 1 \times 10^7 \text{ mL cell}^{-1} \text{ h}^{-1}$ in water (Mabey et al. 1982);

degradation rate $k = 3.76 \times 10^{-19} \text{ mol cell}^{-1} \text{ h}^{-1}$ ($\pm 47\%$ SD) from pure culture studies, $k = 0.02 \times 10^{-14}$ to $2 \times 10^{-14} \text{ mol cell}^{-1} \text{ h}^{-1}$ with microorganisms in Seneca River waters (Banerjee et al. 1984).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 3 d for reaction with OH radical on March 21 at 43°N ; lifetime varies from 2 to 20 d at the latitude of Toronto depending on seasons; at latitude of 43.7°N , tropospheric lifetimes are: 20 d on December 21, 5 d on February 21, 2.2 d on April 21 and 1.5 d on June 21; and at different geographical locations on March 21, lifetimes are 1.7 d at latitude 0° , 2.2 d at 25°S , 6.7 d at 55°S and 680 at 85°S (Bunce et al. 1991);

$t_{1/2} = 21.2\text{--}212$ h, based on estimated rate constant for reaction with hydroxyl radical in air (Howard et al. 1991).

Surface water: rate constant $k < 1.5 \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone at pH 1.5–3.0 (Hoigné & Bader 1983);

$t_{1/2} = 0.8$ h in summer, $t_{1/2} = 3.0$ h in winter for distilled water; $t_{1/2} = 0.7$ h in summer, $t_{1/2} = 2.0$ h in winter for poisoned estuarine water; $t_{1/2} = 0.6$ h in summer, $t_{1/2} = 2.0$ h in winter for estuarine water, all based on photo-transformation rate under full sunlight and microbes; $t_{1/2} = 8.0$ d in summer, $t_{1/2} = 14$ d in winter for distilled water; $t_{1/2} = 6$ d in summer, $t_{1/2} = 14$ d in winter for poisoned estuarine water and $t_{1/2} = 4$ d in summer, $t_{1/2} = 17$ d in winter for estuarine water, based on photo-mineralization rate under full sunlight and microbes (Hwang et al. 1986);

$t_{1/2} = 62$ h in water at pH 8 and $19 \pm 2^\circ\text{C}$ for the reaction with singlet oxygen (Scully & Hoigné 1987);

$t_{1/2} = 2.5\text{--}2.6$ h for photochemical transformation in Xenotest 1200 (Svenson & Björndal 1988);

$t_{1/2} = 0.8\text{--}3$ h based on measured rate of photolysis in distilled water under sunlight in summer and winter (Howard et al. 1991);

complete biodegradation within 5–23 d in seawater (NCASI 1992);

photo-oxidation $t_{1/2} = 2.4$ min for reaction with Fenton's reagent; $t_{1/2} = 30.4$ min at pH 2 and $t_{1/2} = 3.3$ min at pH 9 for reactions with ozone in aqueous solutions (Benitez et al. 2000).

Ground water: $t_{1/2} = 133\text{--}1032$ h, based on unacclimated aqueous aerobic and anaerobic biodegradation half-lives (Howard et al. 1991).

Sediment: mean half-life of dechlorination: $t_{1/2} = 116$ d in July and $t_{1/2} = 47$ d in November (Hale et al. 1991).

Soil: Days for complete disappearance by microbial decomposition in soil suspension: 9 d in Dunkirk silt loam, 3 d in Mardin silt loam (Alexander & Aleem 1961)

$t_{1/2}$ = 176–1680 h, based on aerobic soil die-away test data (Baker et al. 1980; Haider et al. 1974; selected, Howard et al. 1991);
 $t_{1/2}$ = 3.5 d in an acidic clay soil with < 1.0% organic matter and 1.5 d in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).

FIGURE 14.1.2.4.2 Logarithm of vapor pressure versus reciprocal temperature for 2,4-dichlorophenol.

14.1.2.5 2,6-Dichlorophenol

Common Name: 2,6-Dichlorophenol

Synonym: 2,6-DCP

Chemical Name: 2,6-dichlorophenol

CAS Registry No: 87-65-0

Molecular Formula: $C_6H_3Cl_2OH$

Molecular Weight: 163.001

Melting Point ($^{\circ}C$):

68.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

220 (Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

6.91 (Farquharson et al. 1958; Saarikoski & Viluksela 1982; Renner 1990)

6.80 (Doedens 1967; McLeese et al. 1979)

6.79 (Pearce & Simkins 1968)

6.79 (Sillén & Martell 1971; Kaiser et al. 1984; Xie & Dyrssen 1984; Shigeoka et al. 1988)

6.78 (Ugland et al. 1981; Dean 1985)

6.54 (Nendza & Seydel 1988)

Molar Volume (cm^3/mol):

145.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

22.14 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\cdot K$, F: 0.374 (mp at $68.5^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2625 (shake flask-HPLC/UV at pH 4.5, Ma et al. 1993)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

13.1* (extrapolated-regression of tabulated data, temp range 59.5 – $220^{\circ}C$, Stull 1947)

12.9 (extrapolated-Antoine eq., Weast 1972–73)

$\log(P/mmHg) = [-0.2185 \times 13472.0/(T/K)] + 8.864007$; temp range 59.5 – $220^{\circ}C$ (Antoine eq., Weast 1972–73)

12.2 (supercooled liq. value, GC-RT correlation, Hamilton 1980)

12.7 (capillary GC-RT, Bidleman & Renberg 1985)

11.2 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.32845 - 2436.59/(-35.584 + T/K)$; temp range 333 – $493\ K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.2254 - 1106.4/(-151.42 + T/K)$; temp range 353 – $493\ K$ (Antoine eq.-II, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa\cdot m^3/mol$ at $25^{\circ}C$):

0.7376 (calculated-P/C, Shiu et al. 1994)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.86 (Hansch & Leo 1979)

2.34 (HPLC-RT correlation, Butte et al. 1981)

2.64 (HPLC- k' correlation, Hammers et al. 1982)

3.36	(shake flask-UV, Beltrame et al. 1984)
2.84, 2.92	(shake flask-GC, HPLC-k' correlation, Xie et al. 1984)
2.84	(shake flask, Shigeoka et al. 1988)
2.80	(batch equilibration-UV, Beltrame et al. 1988)
2.64	(recommended, Sangster 1993)
2.92	(shake flask-GC, Kishino & Kobayashi 1994)
2.75	(recommended, Hansch et al. 1995)
2.57	(HPLC-RT correlation, Makovskaya et al. 1995b)

Bioconcentration Factor, log BCF:

1.44–1.56 (estimated, NCASI 1992)

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants and Half-Lives:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation: 1920 - ∞ h and 144–360 h for 75% degradation in mineral medium and seawater batch experiments respectively (de Kreuk & Hanstveit 1981)

81% reduction in concn (2 μ M) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: $t_{1/2}$ = 1920 - ∞ h and 144–360 h for 75% degradation in mineral medium and seawater batch experiments, respectively (de Kreuk & Hanstveit 1981).

Ground water:

Sediment:

Soil: $t_{1/2}$ = 16.2 d in an acidic clay soil with < 1.0% organic matter and $t_{1/2}$ = 2.4 d in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).

14.1.2.6 3,4-Dichlorophenol

Common Name: 3,4-Dichlorophenol

Synonym: 3,4-DCP

Chemical Name: 3,4-dichlorophenol

CAS Registry No: 95-77-2

Molecular Formula: $C_6H_3Cl_2OH$

Molecular Weight: 163.001

Melting Point ($^{\circ}C$):

68.0 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

253 (Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

7.39 (Doedens 1967; Jones 1981; Bintein & Devillers 1994)

8.59 (Pearce & Simkins 1968; Serjeant & Dempsey 1979; Hammers et al. 1982)

8.59 (Sillén & Martell 1971; Kaiser et al. 1984)

8.62 (Ugland et al. 1981; Lagas 1988; Renner 1990; Ma et al. 1993)

8.68 (Xie & Dyrssen 1984; Shigeoka et al. 1988; Sangster 1993)

8.63 (Dean 1985)

Molar Volume (cm^3/mol):

145.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

20.93 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\cdot K$), F : 0.379 (mp at $68^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

9256 (shake flask-HPLC/UV at pH 5.1, Ma et al. 1993)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa\cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.37 (Hansch & Leo 1979)

3.05 (HPLC- k' correlation, Hammers et al. 1982)

3.33 (HPLC-RT correlation, Banerjee et al. 1984)

3.47 (shake flask-UV, Beltrame et al. 1984)

3.44, 3.41 (shake flask-GC, HPLC- k' correlation, Xie et al. 1984)

3.44 (shake flask, Shigeoka et al. 1988)

3.68 (shake flask/batch equilibration-UV, Beltrame et al. 1988)

3.33 (recommended, Sangster 1993)

3.27; 3.39 (HPLC-RT correlation; electrometric titration, Slater et al. 1994)

3.33 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

1.43, 1.38 (earthworm *E. fetida andrei*: in Kooyenburg soil, Holten soil, van Gestel & Ma 1988)

1.30, 1.61 (earthworm *L. rubellus*: in Kooyenburg soil, Holten soil, van Gestel & Ma 1988)

1.79, 1.8, 1.94, 2.04 (earthworm system, collated from literature, Connell & Markwell 1990)
 0.8, 1.3, 1.4, 1.80 (earthworm system, derived data, Connell & Markwell 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

3.09 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 3.03 (2.93–3.13) (soil: organic carbon OC $\geq 0.5\%$ and pH ≤ 6.0 , average, Delle Site 2001)

Environmental Fate Rate Constants and Half-Lives:

Volatilization:

Photolysis:

oxidation:

Hydrolysis:

Biodegradation: biodegradation first-order rate of hydroxylation of 0.008 min^{-1} by *Pseudomonas putida* Fl (Spain et al. 1989; quoted, Neilson et al. 1991).

Biotransformation: degradation rate of $6.84 \times 10^{-19} (\pm 38\% \text{ SD}) \text{ mol cell}^{-1} \text{ h}^{-1}$ from pure culture studies (Banerjee et al. 1984).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment: mean half-life of dechlorination: $t_{1/2} = 115 \text{ d}$ in July and $t_{1/2} = 86 \text{ d}$ in November with relatively long $t_{1/2} = 66 \text{ d}$ reported from site 1, $t_{1/2} = 64 \text{ d}$ from site 3 and $t_{1/2} = 132 \text{ d}$ from site 5 in January (Hale et al. 1991).

Soil: disappearance $t_{1/2} = 10.1 \text{ d}$ from Kooyenburg soil, $t_{1/2} = 11.2 \text{ d}$ from Holten soil with earthworms *E. fetida andrei* and $t_{1/2} = 24.7 \text{ d}$ from Kooyenburg soil, $t_{1/2} = 49.5 \text{ d}$ from Holten soil with earthworms *L. rebellus* (van Gestel & Ma 1988);

$t_{1/2} = 18.3 \text{ d}$ in an acidic clay soil with $< 1.0\%$ organic matter and $t_{1/2} = 3.2 \text{ d}$ in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab experiments (Loehr & Matthews 1992).

649 (shake flask-HPLC/UV at pH 4.9, Ma et al. 1993)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

6.69* (extrapolated-regression of tabulated data, temp range $72-251.8^{\circ}C$, Stull 1947)

6.60 (extrapolated liquid value, Antoine eq, Weast 1972-73)

$\log(P/mmHg) = [-0.2185 \times 13237.0/(T/K)] + 8.401072$; temp range $72-251.8^{\circ}C$ (Antoine eq., Weast 1972-73)

6.12 (supercooled liquid, GC-RT correlation, Hamilton 1980)

2.66 (capillary GC-RT, Bidleman & Renberg 1985)

2.93 (selected, Leuenberger et al. 1985)

7.64 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.38179 - 2812.25/(-2.091 + T/K)$; temp range $345-525 K$ (Antoine eq., Stephenson & Malanowski 1987)

2.93 (calculated, Howard 1991)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

0.132	(8°C , Leuenberger et al. 1985)
0.590	(calculated, Howard 1991)
0.521	(calculated-P/C, Shiu et al. 1994)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

3.72	(Leo et al. 1971; Hansch & Leo 1979; 1982)
2.39	(estimated-HPLC-RT correlation, Veith et al. 1979)
3.63	(HPLC- k' correlation, Hammers et al. 1982)
3.80	(shake flask-GC, Saarikoski & Viluksela 1982)
4.19	(shake flask-HPLC/UV, Schellenberg et al. 1984)
4.10, 3.96	(shake flask-GC, HPLC- k' correlation, Xie et al. 1984)
3.73	(HPLC-RT correlation, Miyake et al. 1986)
3.84	(shake flask/batch equilibration-UV, Beltrame et al. 1988)
4.10	(shake flask, Shigeoka et al. 1988)
3.52; 3.55	(shake flask; HPLC-RT correlation, Wang et al. 1989)
3.72	(recommended, Sangster 1993)
4.02	(shake flask-GC, Kishino & Kobayashi 1994)
3.72	(recommended, Hansch et al. 1995)
3.83	(HPLC-RT correlation, Makovskaya et al. 1995b)

Bioconcentration Factor, $\log \text{BCF}$:

3.28	(fathead minnow-28 d exposure, Veith et al. 1979b)
3.28, 2.70	(total ^{14}C in fathead minnows, observed, calculated, mean exposure level $0.0048 \mu\text{g}\cdot\text{mL}^{-1}$, Call et al. 1980)
3.26, 2.82	(total ^{14}C in fathead minnows, observed, calculated, mean exposure level $0.0493 \mu\text{g}\cdot\text{mL}^{-1}$, Call et al. 1980)
3.27	(total ^{14}C in fathead minnows, mean value, Call et al. 1980)
2.40	(calculated- K_{OW} , Mackay 1982)
2.88	(calculated-MCI χ , Sabljic 1987a)
1.79	(fish, van Gestel & Ma 1988)
1.81, 1.53	(earthworms <i>E. fetida andrei</i> : Kooyenburt soil, Holten soil, van Gestel & Ma 1988)
2.04, 2.82	(earthworms <i>L. rubellus</i> : Kooyenburt soil, Holten soil, van Gestel & Ma 1988)
2.04, 2.39, 2.61, 3.36	(earthworm system, collated from literature, Connell & Markwell 1990)
0.40, 1.50, 2.50, 8.40	(earthworm system, derived data, Connell & Markwell 1990)
3.28; 3.61	(fathead minnows; fish, Howard 1991)
2.14	(estimated, NCASI 1992)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

3.49–3.98	(soil, calculated- K_{OW} , model of Karickhoff et al. 1979, Sabljic 1987a,b)
3.38–3.64	(soil, calculated- K_{OW} , model of Kenaga & Goring 1980, Sabljic 1987a,b)
2.56–2.82	(soil, calculated- K_{OW} , model of Briggs 1981, Sabljic 1987a,b)
3.38–3.87	(soil, calculated- K_{OW} , model of Means et al. 1982, Sabljic 1987a,b)
2.55–2.99	(soil, calculated- K_{OW} , model of Chiou et al. 1983, Sabljic 1987a,b)
3.36	(sediment, Schellenberg et al. 1984; quoted, Sabljic 1987a,b)
2.99	(soil, calculated-MCI χ , Sabljic 1987a,b)
3.25, 3.12, 3.38, 2.56	(quoted:lake sediment, river sediment, aquifer material, soil, Howard 1991)
3.34, 3.30	(soils, Howard 1991)
2.93	(calculated- K_{OW} , Kollig 1993)
3.36	(soil, calculated-MCI χ , Sabljic et al. 1995)
3.11 (2.81–3.41), 3.35 (3.30–3.40)	(soils: organic carbon $\text{OC} \geq 0.1\%$ and $\text{pH} 3.4\text{--}6.0$, $\text{OC} \geq 0.5\%$ and $\text{pH} \leq 4.9$ undissociated, average, Delle Site 2001)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: volatilization $t_{1/2} \sim 9.0$ d from a model river 1 m deep, flowing 1 m/s with a wind speed of 3 m/s, and $t_{1/2} = 207$ d from a model pond (Howard 1991).

Photolysis:

$k_p = 1.30 \text{ h}^{-1}$ with $t_{1/2} = 0.6$ h in summer at mean temp. 25°C and $k_p = 0.61 \text{ h}^{-1}$ with $t_{1/2} = 1.0$ h in winter at mean temp 18°C in distilled water; $k_p = 1.2 \text{ h}^{-1}$ with $t_{1/2} = 0.6$ d in summer and $k_p = 0.65 \text{ h}^{-1}$ with $t_{1/2} = 1.0$ h in winter in poisoned estuarine water; and $k_p = 1.4 \text{ h}^{-1}$ with $t_{1/2} = 0.5$ h in summer and $k_p = 0.65 \text{ h}^{-1}$ with $t_{1/2} = 1.0$ h in winter for estuarine water under full sunlight and microbes (photo-transformation, Hwang et al. 1986)

$k_p = 1.30 \text{ h}^{-1}$ corresponding to a $t_{1/2} = 0.5$ h in summer, $k_p = 0.61 \text{ h}^{-1}$ corresponding to a $t_{1/2} = 1.0$ h in winter in distilled water and $k_p = 1.20 \text{ h}^{-1}$ corresponding to a $t_{1/2} = 0.6$ h in summer, $k_p = 0.65 \text{ h}^{-1}$ corresponding to a $t_{1/2} = 1.0$ h in winter in estuarine water under irradiation by natural sunlight (quoted from Hwang et al. 1987, Sanders et al. 1993)

$t_{1/2} = 0.5\text{--}336$ h, based on photolysis rate constants for transformation and mineralization under summer and winter, sunlight conditions (Howard et al. 1991)

photolysis $t_{1/2} = 0.6$ and 1.0 h in natural water (and distilled water) exposed to midday sunlight during summer and winter respectively (Howard 1991)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

aqueous photooxidation $t_{1/2} = 66\text{--}3480$ h in water, based on reported reaction constants for OH and RO_2 radicals with the phenol class (Mill & Mabey 1985; Güesten et al. 1981; selected, Howard et al. 1991)

$k(\text{aq.}) > 10^9 \text{ M}^{-1} \text{ s}^{-1}$ at pH 8, and $k < 3 \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for non-protonated species, $k > 10^9 \text{ M}^{-1} \text{ s}^{-1}$ for phenolate ions for the reaction with ozone in water using 3 mM *t*-BuOH as scavenger at pH 1.2–1.5 and $20\text{--}23^\circ\text{C}$ (Hoigné & Bader 1983b)

$k_{\text{OH}} = 2.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Bunce et al. 1991)

Hydrolysis: $t_{1/2} > 8 \times 10^6$ yr, based on hydrolysis rate constant is zero at pH 7.0 (Kollig et al. 1987; selected, Howard et al. 1991).

Biodegradation: decomposition in suspended soils: > 72 d for complete disappearance (Woodcock 1971; quoted, Verschueren 1983);

840 h for 75% degradation in mineral medium (de Kreuk & Hanstveit 1981);

aqueous aerobic $t_{1/2} = 552\text{--}16560$ h, based on unacclimated aerobic river die-away test data (Lee & Ryan 1979; selected, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 3028\text{--}43690$ h, based on unacclimated anaerobic grab sample data for soil and ground water (Gibson & Suflita 1986; Baker & Mayfield 1980; selected, Howard et al. 1991);

degradation with microbes in darkness negligible (Hwang et al. 1986);

degradation $k = 0.00010 \text{ d}^{-1}$ with a $t_{1/2} = 16560$ h and $k = 0.030 \text{ d}^{-1}$ with a $t_{1/2} = 552$ h for Skidway River water and water-sediment slurry, respectively (Pritchard 1987);

biodegradation $t_{1/2} = 690$ d in river water (Howard 1991)

70% reduction in concn ($2 \mu\text{M}$) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)

$t_{1/2}(\text{aerobic}) = 25$ d, $t_{1/2}(\text{anaerobic}) = 130$ d in natural waters (Capel & Larson 1995)

Biotransformation: degradation rate $k = 1.43 \times 10^{-20}$ ($\pm 77\%$ SD) $\text{mol cell}^{-1} \text{ h}^{-1}$ from pure culture studies and $k = 5 \times 10^{-15} \text{ mol cell}^{-1} \text{ h}^{-1}$ with microorganisms in Seneca River waters (Banerjee et al. 1984).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: tropospheric lifetime of 4 d on March 21 at 43°N (Bunce et al. 1991);

$t_{1/2} = 30.1\text{--}301$ h, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991);

$t_{1/2} \sim 7.5$ d for reactions with OH radical (estimated, Howard 1991);

atmospheric transformation lifetime was estimated to be > 5 d (Kelly et al. 1994).

Surface water: 840 h for 75% degradation in mineral medium (de Kreuk & Hanstveit 1981);

Rate constant $k < 3 \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with O_3 at pH 1.2–1.5 (Hoigné & Bader 1983);

$t_{1/2} = 0.5$ h (summer), $t_{1/2} = 1.0$ h (winter) in distilled water and $t_{1/2} = 0.5$ h (summer), $t_{1/2} = 1.0$ h (winter) in surface estuarine water based on photo-transformation rate under full sunlight and microbes (Hwang et al. 1986);

- $t_{1/2} = 7$ d (summer), $t_{1/2} = 14$ d (winter) in distilled water and $t_{1/2} = 3$ d (summer), $t_{1/2} = 8$ d (winter) in estuarine water based on photo-mineralization rate under full sunlight and microbes (Hwang et al. 1986);
- $t_{1/2} = 0.6$ h (summer), $t_{1/2} = 1.0$ h (winter) in poisoned estuarine water based on photo-transformation rate and $t_{1/2} = 6$ d (summer), $t_{1/2} = 14$ d (winter) in poisoned estuarine water based on photomineralization rate (Hwang et al. 1986);
- $t_{1/2} = 16560$ h at 21°C in Skidway River water (Pritchard 1987);
- photodegradation $t_{1/2} = 0.5$ h (summer), $t_{1/2} = 1.0$ h (winter) in distilled water and $t_{1/2} = 0.6$ h (summer), $t_{1/2} = 1.0$ h (winter) in estuarine water under irradiation by natural sunlight (quoted from Hwang et al. 1987, Sanders et al. 1993);
- $t_{1/2} = 0.5$ –336 h, based on aqueous photolysis half-life (Howard et al. 1991); rapidly photolyze with a $t_{1/2} = 0.6$ –1.0 h at water surfaces, $t_{1/2} = 690$ d in water column (Howard 1991)
- t_2 (aerobic) = 25 d, t_2 (anaerobic) = 130 d in natural waters (Capel & Larson 1995)
- Ground water: $t_{1/2} = 1104$ –43690 h, based on estimated unacclimated aqueous aerobic biodegradation half-life and aqueous anaerobic biodegradation half-life (Howard et al. 1991).
- Sediment: $t_{1/2} = 23$ d from calculated degradation rate constant $k = 0.0030$ d⁻¹ for radiolabeled 2,4,5-TCP in Skidway River water-sediment slurry (Lee & Ryan 1979; quoted, Pritchard 1987);
- biodegradation $t_{1/2} = 23$ d in sediments (Howard 1991).
- Soil: Days for complete disappearance by microbial decomposition in soil suspension: 72 + d in Dunkirk silt loam, 47 + d in Mardin silt loam (Alexander & Aleem 1961)
- disappearance $t_{1/2} = 3.4$ d from Kooyenburg soil and $t_{1/2} = 6.6$ d from Holten soil with earthworms *E. fetida andrei* and $t_{1/2} = 39.6$ d from Kooyenburg soil, $t_{1/2} = 13.9$ d from Holten soil with earthworm *L. rubellus* (van Gestel & Ma 1988);
- $t_{1/2} = 33$ d in sandy loam (Kjeldsen et al. 1990)
- $t_{1/2} = 552$ –16560 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991); under aerobic conditions biodegradation $t_{1/2} = 15$ d in a soil suspension (Howard 1991);
- $t_{1/2} = 22.3$ d in an acidic clay soil with < 1.0% organic matter and $t_{1/2} = 14.6$ d in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).
- Biota: depuration $t_{1/2}$ (obs.) = 12 h, $t_{1/2}$ (calc) = 9.2 h for mean exposure level of 0.0048 µg·mL⁻¹ and $t_{1/2}$ (obs) = 12 h, $t_{1/2}$ (calc) = 6.6 h for mean exposure level of 0.0493 µg·mL⁻¹ (fathead minnow, Call et al. 1980).

TABLE 14.1.2.8.1

Reported vapor pressures of 2,4,5-trichlorophenol at various temperatures

Stull 1947	
summary of literature data	
t/°C	P/Pa
72.0	133.3
102.1	666.6
117.3	1333
134.0	2666
151.5	5333
162.5	7999
178.0	13332
201.5	26664
226.5	53329
251.8	101325
mp/°C	62

FIGURE 14.1.2.8.1 Logarithm of vapor pressure versus reciprocal temperature for 2,4,5-trichlorophenol.

14.1.2.9 2,4,6-Trichlorophenol

Common Name: 2,4,6-Trichlorophenol

Synonym: 2,4,6 TCP

Chemical Name: 2,4,6-trichlorophenol

CAS Registry No: 88-06-2

Molecular Formula: $C_6H_2Cl_3OH$

Molecular Weight: 197.446

Melting Point ($^{\circ}C$):

69 (Lide 2003)

Boiling Point ($^{\circ}C$):

246.0 (Stull 1947; Weast 1982–83; Lide 2003)

Density (g/cm^3):

1.675 (Schmidt-Bleek et al. 1982)

1.491 ($75^{\circ}C$, Weast 1982–83)

Acid Dissociation Constant, pK_a :

6.10 (Blackman et al 1955)

6.22 (Farquharson et al. 1958; Saarikoski & Viluksela 1982)

5.99 (Dean 1985)

6.23 (Serjeant & Dempsey 1979; Tratnyek & Hoigné 1991)

6.00 (Xie 1983, Yoshida et al. 1987)

6.15 (Schellenberg et al. 1984; Leuenberger et al. 1985)

6.18 (Sangster 1993)

Molar Volume (cm^3/mol):

166.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, F: 0.370 (mp at $69^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

858 (gravimetric method, Dacomo 1885)

434 (shake flask-UV at pH 5.1, Blackman et al. 1955)

900 (shake flask-spectrophotometry, Roberts et al. 1977)

430 (IUPAC recommended at pH 5.1, Horvath & Getzen 1985)

312 ($20^{\circ}C$, phenol form, shake flask-HPLC/UV, Yoshida et al. 1987)

$312 \times (1 + 10^{pH-6.06})$ ($20^{\circ}C$, measured at pH 4, 5, 6 and 7, shake flask-HPLC/UV, Yoshida et al. 1987)

300, 580, 270000 (river, oligotrophic lake, eutrophic lake, Yoshida et al. 1987)

708 (shake flask-HPLC/UV at pH 4.7, Ma et al. 1993)

800 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)

692* ($24.9^{\circ}C$, shake flask-conductimetry, measured range 19.5 – $30.0^{\circ}C$, Achard et al. 1996)

1144* ($41.05^{\circ}C$, shake flask-optical method, measured range 314.2 – $420.6 K$, Jaoui et al. 1999)

503 (shake flask-HPLC/UV, pH 5.03, Huang et al. 2000)

439.6* ($21.75^{\circ}C$, shake flask-optical method, measured range 294.9 – $317.2 K$, Jaoui et al. 2002)

$\ln [S/(mol kg^{-1})] = 23.367 - 7096.7/(T/K)$; temp range 292 – $303 K$ (eq. derived using reported exptl. data, Jaoui et al. 2002)

$\ln [S/(mol kg^{-1})] = 6.6069 - 2029.9/(T/K)$; temp range 303 – $334 K$ (eq. derived using reported exptl. data, Jaoui et al. 2002)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 4.17* (extrapolated-regression of tabulated data, temp range 76.5–246°C, Stull 1947)
- 4.00 (20–25°C, extrapolated, Jordan 1954)
- 4.12 (extrapolated liquid, Antoine eq., Weast 1972–73)
- $\log(P/\text{mmHg}) = [-0.2185 \times 14092.8/(T/K)] + 8.82338$; temp range 76.5–246°C (Antoine eq., Weast 1972–73)
- 3.83 (supercooled liquid, GC-RT correlation, Hamilton 1980)
- 1.12 (gas saturation, Politzki et al. 1982)
- 1.30 (20°C, Schmidt-Bleek et al. 1982)
- 1.60 (extrapolated, Mabey et al. 1982)
- 2.67 (Leuenberger et al. 1985)
- 3.26 (capillary GC-RT correlation, supercooled liquid P_L , Bidleman & Renberg 1985)
- 4.28 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 7.67323 - 2876.7/(-11.682 + T/K)$, temp range 349–519 K (Antoine eq., Stephenson & Malanowski 1987)
- 0.827 (GC-RT correlation, solid phase, Yoshida et al. 1987)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C or as indicated):

- 0.405 (calculated-P/C, Mabey et al. 1982)
- 0.132 (8°C, calculated-P/C, Leuenberger et al. 1985)
- $0.523/(1 + 10^{\text{pH} + 6.06})$ (20°C, calculated-P/C, Yoshida et al. 1987)
- 0.5687 (calculated-P/C, Shiu et al. 1994)
- 0.428 (20°C, single equilibrium static technique SEST, Sheikheldin et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 3.06 (Leo et al. 1971)
- 3.69 (Leo et al. 1971)
- 3.69, 3.62, 4.02 (Hansch & Leo 1979)
- 3.76 (HPLC-RT correlation, Butte et al. 1981)
- 3.48 (RP-HPLC- k' correlation, Miyake & Terada 1982)
- 4.03 (shake flask-GC, Saarikoski & Viluksela 1982)
- 3.72 (shake flask-HPLC/UV, Schellenberg et al. 1984)
- 2.97, 2.80 (shake flask, OECD 1981 Guidelines, Geyer et al. 1984)
- 3.75, 3.69 (shake flask-GC, HPLC- k' correlation, Xie et al. 1984)
- 3.72 (OECD 1981 guidelines, Leuenberger et al. 1985)
- 3.29 (RP-HPLC-RT correlation, Chin et al. 1986)
- 3.97 (CPC-RV, Terada et al. 1987)
- 3.75 (HPLC-RT correlation, Shigeoka et al. 1988)
- 3.68 (batch equilibration-UV, Beltrame et al. 1988)
- 3.96; 3.60 (shake flask; HPLC-RT correlation, Wang et al. 1989)
- 3.69 (recommended, Sangster 1993)
- 2.67 (shake flask-GC, Kishino & Kobayashi 1994)
- 3.69 (recommended, Hansch et al. 1995)
- 3.84, 3.76, 3.65, 3.54 (pH 3.0, 6.1, 7.0, 8.0, shake flask-GC (octanol phase)/HPLC (aqueous phase) measured range pH 2.1 to 13.3, Nowosielski & Fein 1998)

Bioconcentration Factor, $\log BCF$:

- 2.00–2.32 (Landner et al. 1977; Laake 1982)
- 2.40 (fish, Körte et al. 1978)
- 1.60, 1.71, 2.49 (activated sludge, algae, golden orfe, Freitag et al. 1982)
- 1.71; 1.81 (algae: exptl; calculated, Geyer et al. 1981)
- 1.54–1.78, 1.60 (mussel *mytilus edulis*, Geyer et al. 1982)
- 2.92 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
- 3.24, 3.48, 3.1–4.09 (algae, snail, guppy, Virtanen & Hattula 1982)
- 1.71, 2.49, 1.60 (algae, fish, activated sludge, Klein et al. 1984)

- 1.71, 2.13 (algae: exptl., calculated- K_{OW} , Geyer et al. 1984)
 1.78, 1.70, 2.49 (activated sludge, algae, golden ide, Freitag et al. 1985)
 1.48–2.08 (rainbow trout, Oikari et al. 1985)
 2.75; 2.84 (Atlantic salmon fry: humic water; lake water, Carlberg et al. 1986)
 1.30 (Isnard & Lambert 1988)
 1.94; 2.83 (flagfish: whole fish; fish lipid, Smith et al. 1990)
 1.87–2.16 (estimated, NCASI 1992)
 1.48–2.08, 3.01–4.09, 2.49, 3.48, 1.60, 1.70–3.24 (trout, guppy, fish, snail, mussel, algae, quoted from literature, NCASI 1992)
 3.6, 5.4, 5.0 (perch bile to water, Söderström et al. 1994)
 2.84 (*Salmo salar*, quoted, Devillers et al. 1996)

Sorption Partition Coefficient, log K_{OC} :

- 2.34 (sediment, Virtanen & Hattula 1982)
 3.30 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 2.52 (soil, Seip et al. 1986)
 3.41–3.84 (soil, calculated- K_{OW} , model of Karickhoff et al. 1979, Sabljic 1987a,b)
 3.33–3.57 (soil, calculated- K_{OW} , model of Kenaga & Goring 1980, Sabljic 1987a,b)
 2.52–2.75 (soil, calculated- K_{OW} , model of Briggs 1981, Sabljic 1987a,b)
 3.30–3.73 (soil, calculated- K_{OW} , model of Means et al. 1982, Sabljic 1987a,b)
 2.48–2.87 (soil, calculated- K_{OW} , model of Chiou et al. 1983, Sabljic 1987a,b)
 3.02 (sediment, Schellenberg et al. 1984; quoted, Sabljic 1987a,b)
 3.03 (sediment, Leuenberger et al. 1985)
 2.99 (soil, calculated, Sabljic 1987a,b)
 3.34, 2.79, 2.23 (average values, soil at pH 6, 7, and 7.7, Yoshida et al. 1987)
 2.79, 3.34, 2.04 (river, oligotrophic lake, eutrophic lake, Yoshida et al. 1987)
 2.50 (soil, calculated-MCI χ , Bahnick & Doucette 1988)
 2.92–3.12; 3.03 (lit. range, mean value, Robinson & Novak 1994)
 2.82–3.02 (log K_{OM} , organic matter, Robinson & Novak 1994)
 2.81, 3.03 (log K_{HA} , humic acid, Robinson & Novak 1994)
 2.25 (calculated- K_{OW} , Kollig 1993)
 3.02 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 2.59; 3.08 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1998)
 2.52 (1.97–3.01), 2.88 (2.33–3.39) (soils: organic carbon OC \geq 0.1% and pH $>$ 4.2, OC \geq 0.1% and pH \leq 4.2 undissociated, average, Delle Site 2001)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

- Volatilization: volatilization and sorption $t_{1/2} \sim 192$ h from natural pond (Schauerte et al. 1982);
 volatilization rate constant from water $k = 3.90 \times 10^{-3} / (1 + 10^{pH-6.06}) / L_w$ h $^{-1}$, L_w , depth of water phase (Yoshida et al. 1987).
 Photolysis: aqueous photolysis $t_{1/2} = 2$ –96 h, based on laboratory photolysis rate constants for an environmental pond at noon under fall sunlight conditions at 40°N latitude (Sugiura et al. 1984; quoted, Howard et al. 1991);
 photo-degradation rate constants $k_p = (0.156 + 9.16 \times 10^{pH-5.86}) / (1 + 10^{pH-5.86})^{-1}$ in water, for summer, fine day, and $k_p = (0.042 + 1.40 \times 10^{pH-6.09}) / ((1 + 10^{pH-6.09})^{-1})$ h $^{-1}$ in water, for winter, fine day; $k = 0.72$ d $^{-1}$ for river, $k = 2.2$ d $^{-1}$ for oligotrophic lake and $k = 0.776$ d $^{-1}$ for eutrophic lake (Yoshida et al. 1987);
 photochemical-transformation $t_{1/2} = 1.2$ h in Xenotest 1200 (Svenson & Björndal 1988);
 photolysis $t_{1/2} = 24$ h (Paasivirta 1992);
 photo-degradation rate constant $k = 26 \times 10^3$ min $^{-1}$ with $t_{1/2} = 25.2$ min for direct UV radiation aqueous solutions (Benitez et al. 2000).
 Oxidation: aqueous oxidation rate constant $k < 7 \times 10^4$ M $^{-1}$ h $^{-1}$ for singlet oxygen and $k = 1 \times 10^6$ M $^{-1}$ h $^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982);
 apparent reaction rate constant $k > 10^8$ M $^{-1}$ s $^{-1}$ at pH 8, and rate constants $k < 10^4$ M $^{-1}$ s $^{-1}$ for non-protonated species, $k > 10^8$ M $^{-1}$ s $^{-1}$ for phenolate ions for the reaction with ozone in water using 3 mM *t*-BuOH as scavenger at pH 1.3–1.5 and 20–23°C (Hoigné & Bader 1983b);

photooxidation $t_{1/2} = 123.4\text{--}1234$ h, based on an estimated rate constant for the vapor phase reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991);

photooxidation $t_{1/2} = 20.3\text{--}2027$ h, based on measured rate data for reaction with singlet oxygen in aqueous solution (Scully & Hoigne 1987; quoted, Howard et al. 1991);

rate constants: $k = 2 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 4.2, $k = 6 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ at pH 4.8, $k = 1.5 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 5.2, $k = 2.6 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 5.5, $k = 5.5 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 6.0, $k = 9.50 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ at pH 7 and $k = 1.2 \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ at pH 9 for the reaction with singlet oxygen in aqueous solution at $(19 \pm 2)^\circ\text{C}$ (Scully & Hoigné 1987);

rate constant $k = (1.7 \pm 0.7) \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen in aqueous phosphate buffer at $27 \pm 1^\circ\text{C}$ (Tratnyek & Hoigné 1991);

photo-oxidation rate constant $k = 98 \times 10^3 \text{ min}^{-1}$ with $t_{1/2} = 5.1$ min for reaction with Fenton's reagent; and $k = 44 \times 10^3 \text{ min}^{-1}$ with $t_{1/2} = 20.6$ min at pH 2 and $k = 314 \times 10^3 \text{ min}^{-1}$ with $t_{1/2} = 3.1$ min at pH 9 for reactions with ozone in aqueous solutions (Benitez et al. 2000).

Hydrolysis: $t_{1/2} > 8 \times 10^6$ yr, based on hydrolysis rate constant of zero at pH 7 (Kollig et al. 1987; quoted, Howard et al. 1991).

Biodegradation: $t_{1/2} = 7\text{--}10$ d for bacteria to utilize 95% of 300 ppm in parent substrate (Tabak et al. 1964); decompositions in soil suspensions: 5 d for complete disappearance (Woodcock 1971; quoted, Verschueren 1983); $t_{1/2} = 216\text{--}432$ h and $624\text{--}1560$ h for 75% degradation in mineral medium and seawater batch experiment, respectively (de Kreuk & Hanstveit 1981);

aqueous aerobic $t_{1/2} = 168\text{--}1680$ h, based on unacclimated aerobic river die-away test and soil grab sample data (Blades-Fillmore et al. 1982; Haider et al. 1974; quoted, Howard et al. 1991);

aqueous anaerobic $t_{1/2} = 4050\text{--}43690$ h, based on unacclimated anaerobic grab sample data for soil (Baker & Mayfield 1980; quoted, Howard et al. 1991);

92% aerobic biodegraded after 28 d by both Sturm of OECD and sealed vessel tests (Birch & Fletcher 1991);

biodegradation rate constant $k = 3.5 \times 10^{-11} \text{ L cell}^{-1} \text{ h}^{-1}$ at 20°C and pH 7;

biodegradation rate constants $k = 8.4 \times 10^{-5} \text{ d}^{-1}$ in river, $k = 8.2 \times 10^{-6} \text{ d}^{-1}$ in oligotrophic lake and $k = 8.4 \times 10^{-4} \text{ d}^{-1}$ in eutrophic lake in water compartment, $k = 8.4 \times 10^{-4} \text{ d}^{-1}$ in river, $k = 8.2 \times 10^{-5} \text{ d}^{-1}$ in oligotrophic lake and $k = 8.4 \times 10^{-3} \text{ d}^{-1}$ in eutrophic lake in soil compartment (Yoshida et al. 1987);

94% reduction in concn (2 -M) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)

up to 60% can be mineralized by acclimated bacteria *pseudomonas aeruginosa* in 48 h but decreased with increasing humic acid concentration (Robinson & Novak 1994)

Degradation constant $k = 3.2\text{-M/h}$ for anaerobic batch experiment in serum bottles; $k = 2.4 \text{-M/h}$ for dechlorination in anaerobic batch or continuous bioreactor; $k = 2.4 \text{-M/h}$ in the sequential anaerobic-aerobic continuous reactor system (Armenante et al. 1999)

Biotransformation: rate constant for bacterial transformation $k = 3 \times 10^9 \text{ mL cell}^{-1} \text{ h}^{-1}$ in water (Mabey et al. 1982).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 421 \text{ d}^{-1}$, 3573 d^{-1} (flagfish: whole fish, fish lipid, Smith et al. 1990)

$k_2 = 4.78 \text{ d}^{-1}$, 5.26 d^{-1} (flagfish: whole fish, fish lipid, Smith et al. 1990)

$k_2 = 4.78 \text{ d}^{-1}$, 2.54 d^{-1} (fish: bioconcentration based; toxicity based, Smith et al. 1990)

Half-Lives in the Environment:

Air: $t_{1/2} = 123.4\text{--}1234$ h, based on an estimated rate constant for the vapor phase reaction with OH radical (Atkinson 1987; quoted, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be $> 5\text{d}$ (Kelly et al. 1994).

Surface water: $t_{1/2} = 216\text{--}432$ h and $624\text{--}1560$ h for 75% degradation in mineral medium and seawater batch experiment, respectively (de Kreuk & Hanstveit 1981);

$t_{1/2} = 1.2$ h, based on photochemical transformation in Xenotest 1200 (Svenson & Björndal 1988);

$t_{1/2} = 2\text{--}96$ h, based on aqueous photolysis half-life (Sugiura et al. 1984; quoted, Howard et al. 1991);

$t_{1/2} = 62$ h for the reaction with singlet oxygen at pH 8 and $(19 \pm 2)^\circ\text{C}$ in water (Scully & Hoigné 1987)

photolysis $t_{1/2} = 24$ h (Paasivirta 1992);

photo-oxidation $t_{1/2} = 5.1$ min for reaction with Fenton's reagent; $t_{1/2} = 20.6$ min at pH 2 and $t_{1/2} = 3.1$ min at pH 9 for reactions with ozone in aqueous solutions (Benitez et al. 2000).

Ground water: $t_{1/2}$ = 336–43690 h, based on estimated unacclimated aqueous aerobic biodegradation half-life and aqueous anaerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: Days for complete disappearance by microbial decomposition in soil suspension: 5 d in Dunkirk silt loam, 13 d in Mardin silt loam (Alexander & Aleem 1961)

$t_{1/2}$ = 168–1680 h, based on estimated unacclimated aqueous aerobic biodegradation half-life including soil grab sample data (Haider et al. 1974; quoted, Howard et al. 1991);

$t_{1/2}$ = 6.3 d in an acidic clay soil with < 1.0% organic matter and $t_{1/2}$ = 5.3 d in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch laboratory microcosm experiments (Loehr & Matthews 1992);

$t_{1/2}$ = 6720 h (Paasivirta 1992).

Biota: $t_{1/2}$ = 0.15 d of clearance from whole flagfish; $t_{1/2}$ = 0.13 d of clearance from flagfish lipid (Smith et al. 1990).

TABLE 14.1.2.9.1

Reported aqueous solubilities and vapor pressures of 2,4,6-trichlorophenol at various temperatures

14.1.2.10 2,3,4,5-Tetrachlorophenol

Common Name: 2,3,4,5-Tetrachlorophenol

Synonym:

Chemical Name: 2,3,4,5-tetrachlorophenol

CAS Registry No: 4901-51-3

Molecular Formula: C_6HCl_4OH

Molecular Weight: 231.891

Melting Point ($^{\circ}C$):

116.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

sublimation (Weast 1982–83; Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

6.96 (Doedens 1967)

5.30 (Sillén & Martell 1971; Kaiser et al. 1984)

5.64 (Könemann 1981; Könemann & Musch 1981; Ugland et al. 1981; Dean 1985; Renner 1990)

6.35 (Schellenberg et al. 1984)

6.61 (Xie & Dyrssen 1984)

6.12 (Nendza & Seydel 1988)

6.48 (Sangster 1993)

Molar Volume (cm^3/mol):

187.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.127 (mp at $116.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

166 (shake flask-HPLC/UV at pH 4.9, Ma et al. 1993)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant (Pa m^3/mol):

0.140 (calculated-P/C, Shiu et al. 1994)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.95 (Hansch & Leo 1979)

5.03 (HPLC-RT correlation, Banerjee et al. 1984)

4.21 (shake flask-UV, Beltrame et al. 1984)

4.87 ($20^{\circ}C$, shake flask-HPLC, Schellenberg et al. 1984)

4.82, 4.68 (shake flask-GC, HPLC- k' correlation, Xie et al. 1984)

4.71 (shake flask-GC, Xie & Dyrssen 1984)

4.54 (batch equilibration-UV, Beltrame et al. 1988)

4.21 (recommended, Sangster 1993)

4.21 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, log BCF:

- 1.61, 1.60 (earthworm *E. fetida andrei*: in Kooyenburg soil, Holten soil, van Gestel & Ma 1988)
 2.55, 2.33 (earthworm *L. rubellus*: in Kooyenburg soil, Holten soil, van Gestel & Ma 1988)
 2.61, 2.73, 3.49, 3.53 (earthworm system, collated from literature, Connell & Markwell 1990)
 0.40, 0.50, 2.30, 4.10 (earthworm system, derived data, Connell & Markwell 1990)

Sorption Partition Coefficient, log K_{OC} :

- 4.21–4.66 (soil, calculated- K_{OW} , model of Karickhoff et al. 1979, Sabljic 1987a,b)
 3.77–4.01 (soil, calculated- K_{OW} , model of Kenaga & Goring 1980, Sabljic 1987a,b)
 2.94–3.17 (soil, calculated- K_{OW} , model of Briggs 1981, Sabljic 1987a,b)
 4.11–4.55 (soil, calculated- K_{OW} , model of Means et al. 1982, Sabljic 1987a,b)
 3.20–3.60 (soil, calculated- K_{OW} , model of Chiou et al. 1983, Sabljic 1987a,b)
 4.12 (sediment, Schellenberg et al. 1984; quoted, Sabljic 1987a,b)
 3.32 (soil, calculated-MCI χ , Sabljic 1987a,b)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photochemical transformation $t_{1/2} = 0.88$ h in Xenotest 1200 (Svenson & Björndal 1988).

Oxidation:

Hydrolysis:

Biodegradation: 100% reduction in concn (2 μ M) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)

Biotransformation: degradation rate constant $k = 7.14 \times 10^{-22}$ ($\pm 41\%$ SD) $\text{mol}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ from pure culture studies and $k = 5 \times 10^{-16}$ $\text{mol}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ with microorganisms in Seneca River waters (Banerjee et al. 1984).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: $t_{1/2} = 0.88$ h, based on photochemical transformation in Xenotest 1200 (Svenson & Björndal 1988).

Ground water:

Sediment:

Soil: disappearance $t_{1/2} = 43.4$ d from Kooyenburg soil, $t_{1/2} = 29.1$ d from Holten soil with earthworm *E. fetida andrei* and $t_{1/2} = 26.8$ d from Kooyenburg soil, $t_{1/2} = 42.5$ d from Holten soil with earthworm *L. rebellus* (van Gestel & Ma 1988).

Biota:

14.1.2.11 2,3,4,6-Tetrachlorophenol

Common Name: 2,3,4,6-Tetrachlorophenol

Synonym:

Chemical Name: 2,3,4,6-tetrachlorophenol

CAS Registry No: 58-90-3

Molecular Formula: C_6HCl_4OH

Molecular Weight: 231.891

Melting Point ($^{\circ}C$):

70.0 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

150 (at 15 mm Hg, Weast 1982–83)

Density (g/cm^3):

1.60 (at $60^{\circ}C$, Verschueren 1983)

Acid Dissociation Constant, pK_a :

5.40 (Blackman et al. 1955; Xie 1983; Schellenberg et al. 1984; Sangster 1993)

5.46 (Farquharson et al. 1958; Saarikoski & Viluksela 1982; Renner 1990)

5.30 (Sillén & Martell 1971; McLeese et al. 1979; Kaiser et al. 1984)

5.22 (Ugland et al. 1981; Dean 1985; Lagas 1988; Renner 1990; Ma et al. 1993)

5.62 (Xie & Dyrssen 1984; Xie et al. 1986; Shigeoka et al. 1988; Söderström et al. 1994)

Molar Volume (cm^3/mol):

187.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} , (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, F: 0.362 (mp at $70^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

183 (shake flask-UV at pH 5.1, Blackman et al. 1955)

180 (recommended at pH 5.1, IUPAC Solubility Data Series, Horvath & Getzen 1985)

166 (shake flask-HPLC/UV, pH 4.62, Huang et al. 2000)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.763 (extrapolated-regression of tabulated data, temp range 100 – $275^{\circ}C$, Stull 1947)

0.750 (extrapolated liquid, Antoine eq., Weast 1972–73)

$\log(P/mmHg) = [-0.2185 \times 15362.7/(T/K)] + 9.016052$; temp range 100 – $275^{\circ}C$ (Antoine eq., Weast 1972–73)

0.692 (supercooled liq. value, GC-RT correlation, Hamilton 1980)

0.564 (capillary GC-RT correlation, Bidleman & Renberg 1985)

0.810 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.96172 - 3227.92/(-6.121 + T/K)$; temp range 373 – $548 K$ (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa m^3/mol$):

0.3548 (calculated-P/C, Shiu et al. 1994)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.10 (Hansch & Leo 1979)

4.27 (RP-HPLC- k' correlation, Miyake & Terada 1982)

4.45 (shake flask-GC, Saarikoski & Viluksela 1982)

- 4.12 (shake flask-UV, Beltrame et al. 1984)
- 4.42 (shake flask-HPLC/UV, Schellenberg et al. 1984)
- 4.42, 4.34 (shake flask-GC, HPLC- k' correlation, Xie et al. 1984)
- 4.31 (shake flask-GC, Xie & Dyrssen 1984)
- 4.42 (OECD 1981 guidelines, Leuenberger et al. 1985)
- 4.25 (centrifugal partition chromatography CPC-RV, Terada et al. 1987)
- 4.42 (shake flask, Shigeoka et al. 1988)
- 4.37 (shake flask/batch equilibration-UV, Beltrame et al. 1988)
- 4.45 (recommended, Sangster 1993)
- 4.24 (shake flask-GC, Kishino & Kobayashi 1994)
- 4.45 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

- 2.65 (trout, Hattula et al. 1981)
- 2.55–2.69 (estimated, NCASI 1992)
- 3.3, 3.8, 4.4, 4.5 (perch bile to water, Söderström et al. 1994)

Sorption Partition Coefficient, log K_{OC} :

- 4.21 (soil, calculated- K_{OW} , model of Karickhoff et al. 1979, Sabljic 1987a,b)
- 3.77 (soil, calculated- K_{OW} , model of Kenaga & Goring 1980, Sabljic 1987a,b)
- 2.94 (soil, calculated- K_{OW} , model of Briggs 1981, Sabljic 1987a,b)
- 4.11 (soil, calculated- K_{OW} , model of Means et al. 1982, Sabljic 1987a,b)
- 3.20 (soil, calculated- K_{OW} , model of Chiou et al. 1983, Sabljic 1987a,b)
- 3.82 (sediment, Schellenberg et al. 1984; quoted, Sabljic 1987a,b)
- 3.35 (soil, Seip et al. 1986; quoted, Sabljic 1987a,b)
- 3.32 (soil, calculated-MCI χ , Sabljic 1987a,b)
- 3.90 (calculated, Lagas 1988)
- 2.45, 2.70 (totally dissociated as phenolate-calculated, Lagas 1988)
- 3.35 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
- 3.02 (2.35–3.69), 3.06 (2.31–3.81), 3.75(3.69–3.81), 2.28(2.16–2.40) (soils: organic carbon $OC \geq 0.1\%$ and pH 3.4–7.5, $OC \geq 0.5\%$, $OC \geq 0.5\%$ pH ≤ 3.4 undissociated, $OC \geq 0.5\%$ pH ≥ 7.4 dissociated, average, Delle Site 2001)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: aqueous photolysis $t_{1/2} \sim 1$ –336 h, based on aqueous data for 2,4,5- 2,4,6-trichlorophenols and pentachlorophenol (Howard et al. 1991);
photo-degradation rate constant $k = 21 \times 10^3 \text{ min}^{-1}$ with $t_{1/2} = 30.6 \text{ min}$ for direct UV radiation aqueous solutions (Benitez et al. 2000).

Photooxidation: atmospheric $t_{1/2} = 364.4$ –3644 h, based on estimated rate constant for reaction with OH radical and aqueous $t_{1/2} = 66.0$ –3480 h, based on reaction rate constants with OH and $RO_2\cdot$ radicals with phenol class (Howard et al. 1991);

photo-oxidation rate constant $k = 9 \times 10^3 \text{ min}^{-1}$ with $t_{1/2} = 49.5 \text{ min}$ for reaction with Fenton's reagent; and $k = 94 \times 10^3 \text{ min}^{-1}$ with $t_{1/2} = 10.6 \text{ min}$ at pH 2 and $k = 415 \times 10^3 \text{ min}^{-1}$ with $t_{1/2} = 1.9 \text{ min}$ at pH 9 for reactions with ozone in aqueous solutions (Benitez et al. 2000).

Hydrolysis: no hydrolyzable groups (Howard et al. 1991).

Biodegradation: decomposition in soil suspensions: $t_{1/2} > 72 \text{ d}$ for complete disappearance (Woodcock 1971; quoted, Verschuere 1983);

aqueous aerobic $t_{1/2} = 672$ –4032 h, based on acclimated aerobic screening test data and aqueous anaerobic $t_{1/2} = 2688$ –16128 h, based on unacclimated aerobic biodegradation half-lives (Howard et al. 1991).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 364.4\text{--}3644$ h, based on estimated photooxidation half-life in air (Howard et al. 1991).

Surface water: $t_{1/2} = 0.88$ h, based on photochemical transformation in Xenotest 1200 (Svenson & Björndal 1988);

$t_{1/2} = 1\text{--}336$ h, based on estimated aqueous photolysis data for trichlorophenols and PCP (Howard et al. 1991);

photo-oxidation $t_{1/2} = 49.5$ min for reaction with Fenton's reagent; $t_{1/2} = 10.6$ min at pH 2, and $t_{1/2} = 1.9$ min at pH 9 for reactions with ozone in aqueous solutions (Benitez et al. 2000).

Ground water: $t_{1/2} = 1344\text{--}8640$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: Days for complete disappearance by microbial decomposition in soil suspension: 72 ± 2 d in Dunkirk silt loam (Alexander & Aleem 1961)

$t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

14.1.2.12 2,3,5,6-Tetrachlorophenol

Common Name: 2,3,5,6-Tetrachlorophenol

Synonym:

Chemical Name: 2,3,5,6-tetrachlorophenol

CAS Registry No: 935-95-5

Molecular Formula: $C_6H_2Cl_4O$, C_6HCl_4OH

Molecular Weight: 231.891

Melting Point ($^{\circ}C$):

115 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

5.30 (Sillen & Martell 1971)

5.03 (Konemann 1981; Ugland et al. 1981)

5.40 (Sangster 1993)

Molar Volume (cm^3/mol):

187.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, F: 0.131 (mp at $115^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

100 (shake flask-HPLC/UV, pH 5.0, Ma et al. 1993)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.90 (Hansch & Leo 1979)

4.42 (calculated-fragment constant, Konemann 1981)

4.88 (HPLC-RT correlation, Butte et al. 1981)

3.88 (shake flask-UV, Beltrame et al. 1984)

4.47 (HPLC-RT correlation, Xie et al. 1984)

3.88 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$, or Lifetimes, τ :

Biodegradation: 100% reduction in concn ($2 \mu M$) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

14.1.2.13 Pentachlorophenol

Common Name: Pentachlorophenol

Synonym: chlorophen, PCP, penchlorol

Chemical Name: pentachlorophenol

CAS Registry No: 87-86-5

Molecular Formula: C_6Cl_5OH

Molecular Weight: 266.336

Melting Point ($^{\circ}C$):

191.0 (Firestone 1977; Weast 198–83)

174 (Lide 2003)

Boiling Point ($^{\circ}C$):

309–310 (dec., Weast 1982–83)

310 (dec., Lide 2003)

Density (g/cm^3):

1.987 (Firestone 1977)

1.978 ($22^{\circ}C$, Weast 1982–83)

Acid Dissociation Constant, pK_a :

4.80 (Blackman et al. 1955; Sillén & Martell 1971; McLeese et al. 1979; Kaiser et al. 1984)

5.00 (Farquharson et al. 1958; Renner 1990)

4.74 (Drahonovsky & Vacek 1971)

4.71 (spectrophotometric, Cessna & Grover 1978)

5.20 (Renberg 1981; Renner 1990; Larsson et al. 1993)

5.25 (Schellenberg et al. 1984)

4.90 (Xie & Dyrssen 1984; Xie et al. 1986; Shigeoka et al. 1988; Söderström et al. 1994)

4.60 (Nendza & Seydel 1988)

Molar Volume (cm^3/mol):

207.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.5 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.0350 (mp at $174^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

15.4* (gravimetric method, measured range $0-70^{\circ}C$, Carswell & Nason 1938)

18.0 ($27^{\circ}C$, gravimetric method, Carswell & Nason 1938)

9.59 (shake flask-UV, at pH 5.1, Blackman et al. 1955)

14.0 ($20^{\circ}C$, shake flask-UV, at pH 3.0, Bevenue & Beckman 1967)

10.0 (shake flask-gravimetric, at pH 5.0, Toyota & Kuwahara 1967)

14.0 (gravimetric at pH 5.0, Toyota & Kuwahara 1967)

5–10 (at pH 5–6 in contaminated water, Goerlitz et al. 1985)

14.0 (IUPAC recommended at pH 4.5–5.5, Horvath & Getzen 1985)

8.0 ± 2 (shake flask-UV at pH 2.5, Valsaraj et al. 1991)

32 ± 3 (shake flask-UV at pH 5.0, Valsaraj et al. 1991)

18.4 (shake flask-HPLC/UV, at pH 4.8, Ma et al. 1993)

5.0 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)

21.4* ($25.1^{\circ}C$, shake flask-conductimetry, measured range $25.1-46.8^{\circ}C$, Achard et al. 1996)

- 13.0 (shake flask-HPLC/UV, pH 4.55, Huang et al. 2000)
 102* (60.05°C, shake flask-optical method, measured range 333.2–422.3 K, Jaoui et al. 1999)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.0227* (20°C, extrapolated-static method, measured range 100–220°C, Carswell & Nason 1938)
 2666* (192.2°C, summary of literature data, temp range 192.2–309.3°C, Stull 1947)
 0.108* (46.0°C, ebulliometry, measured range 46.0–233.87°C, McDonald et al. 1959)
 0.0147–0.0227 (20°C, Goll 1954; Bevenue & Beckman 1967; Neumüller 1974)
 0.0147 (20°C, Bevenue & Beckman 1967)
 0.100 (extrapolated-Antoine eq., Weast 1972–73)
 $\log(P/\text{mmHg}) = [-0.2185 \times 16742.6/(T/K)] + 9.150200$; temp range 192.2–309.3°C (Antoine eq., Weast 1972–73)
 0.231 (supercooled liq. extrapolated-Antoine eq., Weast 1976–77; quoted, Bidleman & Renberg 1985)
 0.0213 (Firestone 1977)
 0.0956 (supercooled liquid, GC-RT correlation, Hamilton 1980)
 0.00415 (23°C, OECD, Klöpffer et al. 1982)
 0.1153 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 7.22246 - 2846.009/(230.158 + t/^\circ\text{C})$, temp range 200–253°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 0.115 (capillary GC-RT, supercooled liquid P_L , Bidleman & Renberg 1985)
 0.127 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 8.198 - 3606/(T/K)$, temp range 463–507 K (Antoine eq., Stephenson & Malanowski 1987)
 0.0070* (gas saturation-GC, measured range 25–125°C, Rordorf 1989)
 0.0147 (Howard 1991)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

- 0.284 (calculated-P/C, Mabey et al. 1982)
 0.0025 (calculated-P/C, Hellmann 1987)
 0.0127 (estimated-bond contribution, Hellmann 1987)
 0.277 (calculated-P/C, Howard 1991)
 0.079 (calculated-P/C, Shiu et al. 1994)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 5.01 (Leo et al. 1971)
 3.81 (Lu & Metcalf 1975)
 5.01, 5.12, 5.86, 3.81 (lit. values, Hansch & Leo 1979)
 5.01 (HPLC-RT correlation, Veith et al. 1979b)
 5.10 (HPLC- k' correlation, Butte et al. 1981)
 4.00 (at pH 4, Renberg 1981)
 5.08 (RP-HPLC- k' correlation, Miyake & Terada 1982)
 5.15 (shake flask-GC, Saarikoski & Viluksela 1982; Saarikoski et al. 1986)
 4.84 (shake flask-GC, apparent value at pH 1.2, Kaiser & Valdmanis 1982)
 1.30 (shake flask-GC, apparent value at pH 10.5, Kaiser & Valdmanis 1982)
 3.69 (Geyer et al. 1982, Schmidt-Bleek et al. 1982)
 3.29 (shake flask average, OECD/EEC Lab. comparison tests, Harnish et al. 1983)
 5.11 ± 0.07 (HPLC-retention volume correlation-ALPM, Garst & Wilson 1984)
 3.69, 3.81 (shake flask, OECD 1981 Guidelines, Geyer et al. 1984)
 5.24 (shake flask-HPLC/UV, Schellenberg et al. 1984)
 5.04, 5.08 shake flask-GC, HPLC- k' , Xie et al. 1984)
 5.12 (Hansch & Leo 1985)
 5.24 (OECD 1981 guidelines, Leuenberger et al. 1985)
 4.71 (RP-HPLC-RT correlation, Chin et al. 1986)
 2.50 (at pH 4.7, Geyer et al. 1987)
 4.47 (centrifugal partition chromatography CPC-RV, Terada et al. 1987)
 5.04 (HPLC-RT correlation, Shigeoka et al. 1988)

- 5.00 (shake flask/batch equilibration-UV, Beltrame et al. 1988)
- 5.18 (recommended, LOGKOW databank, Sangster 1993)
- 5.06, 5.12 (COMPUTOX databank, Kaiser 1993)
- 5.02 (shake flask-GC/ECD, Kishino & Kobayashi 1994)
- 5.12 (recommended, pH 1.4, Hansch et al. 1995)
- 4.74, 4.60, 4.27, 3.69, 3.59 (pH 2.1–3.1, 5.0, 6.1, 7.2, 8.0, shake flask-GC (octanol phase)/HPLC (aqueous phase), measured range pH 2.1–13.3, Nowosielski & Fein 1998)

Bioconcentration Factor, log BCF:

- 3.75 (fish, Statham et al. 1976)
- 3.04 (fish, Körte et al. 1978)

 3.15 (pH 5, HA extracted from water of River Arno, De Paolis & Kukkonen 1997)
 3.40 (pH 5, HA + FA extracted from water of River Arno, De Paolis & Kukkonen 1997)
 3.28, 3.28, 3.15 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, and pH 2.0–> 10, average, Delle Site 2001)
 3.38, 3.51, 2.92 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, and pH 3.4–6.9, average, Delle Site 2001)
 4.48, 4.54, 4.38 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, and pH ≤ 3 undissociated, average, Delle Site 2001)
 2.82, 2.89, 2.63 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, and pH –7.1 dissociated, average, Delle Site 2001)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

- Volatilization/evaporation: $t_{1/2} = 84$ h from the rate of loss experiment on watch glass for an exposure period of 192 h (Dobbs & Grant 1980);
 stripping loss rate constant $k = 0.0076$ d⁻¹ (Moos et al. 1983);
 $k = 0.028$ d⁻¹ for nondissociated PCP, assuming diffusion coefficient in air to be 7×10^{-6} m²/s and in water 7×10^{-10} m²/s with wind speed 0.1 m above the pond is 2 m/s and the average temperature is 15°C for water depth of 1 m (Crossland & Wolff 1985);
 $k(\text{calc}) = 5 \times 10^{-4}$ d⁻¹ to 1×10^{-7} d⁻¹ for total PCP (Crossland & Wolff 1985).
 Photolysis: photolysis: $t_{1/2}(\text{calc}) = 4.75$ h from observed rate $k = 3.4 \times 10^{-4}$ s⁻¹ for a depth of 300 cm at pH 7 with light intensity of 0.04 watts/cm² between 290 and 330 nm on a midsummer day at the latitude of Cleveland, Ohio (Hiatt et al. 1960; quoted, Callahan et al. 1979);
 photolysis $t_{1/2} = 1.5$ d was estimated from photolytic destruction by sunlight in an aqueous solution at Davis, California (Wong & Crosby 1978; quoted, Callahan et al. 1979);
 exposure of aqueous PCP solutions to either sunlight or laboratory ultraviolet light resulted in rapid degradation at pH 7.3 and slower degradation at pH 3.3 (Wong & Crosby 1981);
 photolytic $t_{1/2} = 10$ –15 d (Brockway et al. 1984); $k = 0.23$ to 0.46 d⁻¹ for direct photo-transformation, is the main loss process for PCP from ponds, with $t_{1/2} = 1.5$ to 3.0 d (Crossland & Wolff 1985);
 photo-transformation rate constants $k = 0.6$ h⁻¹ with $t_{1/2} = 1$ h for distilled water in summer (mean temperature 25°C) and $k = 0.37$ h⁻¹ with $t_{1/2} = 2$ h in winter (mean temperature 11°C); $k = 0.37$ h⁻¹ with $t_{1/2} = 2$ h for

- both poisoned estuarine water and estuarine water in summer and $k = 0.27 \text{ h}^{-1}$ with $t_{1/2} = 3 \text{ h}$ in winter during days when exposed to full sunlight and microbes (Hwang et al. 1986);
- photo-mineralization rate constants $k = 0.11 \text{ h}^{-1}$ with $t_{1/2} = 6 \text{ d}$ for distilled water in summer (mean temperature 25°C) and $k = 0.049 \text{ h}^{-1}$ with $t_{1/2} = 14 \text{ d}$ in winter (mean temperature 11°C); $k = 0.12 \text{ h}^{-1}$ with $t_{1/2} = 6 \text{ d}$ for poisoned estuarine water in summer and $t_{1/2} = 0.07 \text{ h}^{-1}$ with $t_{1/2} = 10 \text{ d}$ in winter; $k = 0.25 \text{ h}^{-1}$ with $t_{1/2} = 10 \text{ d}$ for estuarine water in summer and $k = 0.10 \text{ h}^{-1}$ with $t_{1/2} = 7 \text{ d}$ for winter during days when exposed to full sunlight and microbes (Hwang et al. 1986);
- photochemical transformation $t_{1/2} = 0.75 \text{ h}$ in Xenotest 1200 (Svenson & Björndal 1988);
- aqueous $t_{1/2} = 1\text{--}110 \text{ h}$ (Hwang et al. 1986; Sugiura et al. 1984; selected, Howard et al. 1991)
- $t_{1/2} = 7.43 \text{ d}$, assuming a linear rate of photolysis during 96-h period, (Smith et al. 1987)
- photodegradation $k = 0.60 \text{ h}^{-1}$ corresponding to a $t_{1/2} = 1.0 \text{ h}$ (summer), $k = 0.37 \text{ h}^{-1}$ corresponding to a $t_{1/2} = 2 \text{ h}$ (winter) in distilled water; and $t_{1/2} = 0.37 \text{ h}^{-1}$ corresponding to a $t_{1/2} = 2 \text{ h}$ (summer), 0.27 h^{-1} corresponding to a $t_{1/2} = 3.0 \text{ h}$ (winter) in estuarine water under irradiation by natural sunlight (quoted from Hwang et al. 1987, Sanders et al. 1993).
- Oxidation: aqueous oxidation rate constant $k < 7 \times 10^3 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 1 \times 10^5 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982);
- $k \gg 3.0 \times 10^5 \text{ M}^{-1} \text{ s}^{-1}$ with 3 mM AcOH as scavenger for the reaction with ozone in water at pH 2.0 (Hoigné & Bader 1983b);
- photooxidation $t_{1/2} = 66\text{--}3480 \text{ h}$ in water, based on reported reaction rate constants for reaction of OH and RO_2 radicals with phenol class in aqueous solution (Mill & Mabey 1985; Güesten et al. 1981; quoted, Howard et al. 1991);
- photooxidation $t_{1/2} = 139.2\text{--}1392 \text{ h}$, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);
- rate constant $k = 4.7 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in air (Bunce et al. 1991)
- rate constant $k = (0.2 \pm 5.5) \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen in aqueous phosphate buffer at $27 \pm 1^\circ\text{C}$ (Tratnyek & Hoigné 1991);
- atmospheric $t_{1/2} < 24 \text{ h}$ at noon in mid-summer to $t_{1/2} = 216 \text{ h}$ in January at latitude of 41.79°N for reaction with OH radical (Bunce et al. 1991).
- Hydrolysis: is not expected to occur (Crossland & Wolff 1985).
- Biodegradation: first order microbial degradation rate constant $k = 7.4 \times 10^{-4} \text{ h}^{-1}$ in sediment and water (Yoshida & Kojima 1978, quoted, Addison et al. 1983);
- $t_{1/2} = 1800\text{--}2160 \text{ h}$ and $480\text{--}\infty \text{ h}$ to obtain 75% degradation in mineral medium and seawater, respectively (de Kreuk & Hanstveit 1981);
- $k = 0.10 \text{ d}^{-1}$ with a $t_{1/2} = 7 \text{ d}$ in unadapted Nutrient Broth and $k = 1.0 \text{ d}^{-1}$ with a $t_{1/2} = 0.7 \text{ d}$ in adapted Nutrient Broth under aerobic conditions (Mills et al. 1982);
- aqueous aerobic $t_{1/2} = 552\text{--}4272 \text{ h}$, based on unacclimated and acclimated aerobic sediment grab sample data (Delaune et al. 1983; Baker & Mayfield 1980; quoted, Howard et al. 1991);
- aqueous anaerobic $t_{1/2} = 1008\text{--}36480 \text{ h}$, based on unacclimated anaerobic grab sample data for soil and ground water (Ide et al. 1972; Baker & Mayfield 1980; quoted, Howard et al. 1991);
- aerobic degradation rate constant $k = 0.0017 \text{ L } \mu\text{g}^{-1} \cdot \text{d}^{-1}$ (Moos et al. 1983);
- microbial degradation negligible in darkness (Hwang et al. 1986);
- 100% reduction in concn ($2 \mu\text{M}$) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)
- degradation rate constant $k = 0.12 \pm 0.01 \text{ h}^{-1}$ in the absence of light (Minero et al. 1993).
- $t_{1/2}(\text{aerobic}) = 23 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 42 \text{ d}$ in natural waters (Capel & Larson 1995)
- Biotransformation: first order fish metabolism $k = 1.5 \times 10^{-5} \text{ h}^{-1}$ (Sanborn et al. 1975, quoted, Addison et al. 1983);
- bacterial transformation $k = 3 \times 10^9 \text{ mL cell}^{-1} \text{ h}^{-1}$ in water (Mabey et al. 1982);
- degradation rate $k = 3 \times 10^{-14} \text{ mol cell}^{-1} \text{ h}^{-1}$ with microorganisms in Seneca River waters (Banerjee et al. 1984).
- Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:
- $k_1 = 18.3 \text{ h}^{-1}$, 19 h^{-1} (at 1 mM buffer concn.), 18.5 h^{-1} (at 10 mM buffer concn.) at pH 8 (guppy *p. reticulata*, Saarikoski et al. 1986)
- $k_1 = 222 \text{ d}^{-1}$, 1677 d^{-1} (flagfish: whole fish; fish lipid, Smith et al. 1990)
- $k_2 = 1.03 \text{ d}^{-1}$, 1.03 d^{-1} (flagfish: whole fish; fish lipid, Smith et al. 1990)

$k_2 = 1.03 \text{ d}^{-1}$, 0.95 d^{-1} (flagfish: BCF based, toxicity based, Smith et al. 1990)
 $k_2 = 0.00195 \pm 0.00063 \text{ h}^{-1}$ (*m. relictus*, Landrum & Dupuis 1990)
 $k_2 = 0.00330 \pm 0.00140 \text{ h}^{-1}$ (*p. hoyi*, Landrum & Dupuis 1990)
 $k_1 = 662.4 \text{ d}^{-1}$, $k_2 = 0.502 \text{ d}^{-1}$ (algae *Chlorella fusca*, Wang et al. 1996)
 $k_1 = 0.733 \text{ d}^{-1}$, $k_2 = 0.020 \text{ d}^{-1}$ (eggshell of dissected parts of lake salmon, Mäenpää et al. 2004)
 $k_1 = 0.680 \text{ d}^{-1}$, $k_2 = 0.000 \text{ d}^{-1}$ (yolk sac of dissected parts of lake salmon, Mäenpää et al. 2004)
 $k_1 = 2.828 \text{ d}^{-1}$, $k_2 = 0.015 \text{ d}^{-1}$ (embryo of dissected parts of lake salmon, Mäenpää et al. 2004)

Half-Lives in the Environment:

- Air: tropospheric lifetime of 4 d for reaction with OH radical on March 21 at 43°N (Bunce et al. 1991);
 $t_{1/2} = 139.2\text{--}1392 \text{ h}$, based on an estimated rate constant for the vapor phase reaction with hydroxyl radicals in air; photolysis $t_{1/2} = 6.5 \text{ h}$ in noonday summer sunshine (Howard 1991);
 atmospheric transformation lifetime was estimated to be $> 5 \text{ d}$ (Kelly et al. 1994).
- Surface water: calculated photolysis $t_{1/2} = 4.75 \text{ h}$ from a determined rate $k = 3.4 \times 10^{-4} \text{ s}^{-1}$ for a depth of 300 cm at pH 7 with light intensity of 0.04 watts/cm² between 290 and 330 nm on a midsummer day at the latitude of Cleveland, Ohio (Hiatt et al. 1960; quoted, Callahan et al. 1979);
 photolysis $t_{1/2} = 1.5 \text{ d}$ was estimated from photolytic destruction by sunlight in an aqueous solution at Davis, California (Wong & Crosby 1978; quoted, Callahan et al. 1979);
 photolytic $t_{1/2} = 10\text{--}15 \text{ d}$ (Brockway et al. 1984);
 rate constant $k \gg 3.0 \times 10^5 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone at pH 2.0 (Hoigné & Bader 1983);
 estimated direct photolysis midday $t_{1/2} = 20 \text{ min}$ from experimentally determined rate constant $k = 2.1 \text{ h}^{-1}$ (quoted unpublished result, Zepp et al. 1984);
 $t_{1/2} = 1.5 \text{ to } 3.0 \text{ d}$ for direct photo-transformation from outdoor ponds (Crossland & Wolff 1985);
 $t_{1/2} = 1 \text{ h}$ (summer), $t_{1/2} = 2 \text{ h}$ (winter) for distilled water; $t_{1/2} = 2 \text{ h}$ (summer), $t_{1/2} = 3 \text{ h}$ (winter) for estuarine water; $t_{1/2} = 2 \text{ h}$ (summer), $t_{1/2} = 3 \text{ h}$ (winter) for poisoned estuarine water, based on photo-transformation rate constants (Hwang et al. 1986); $t_{1/2} = 6 \text{ d}$ (summer), $t_{1/2} = 14 \text{ d}$ (winter) for distilled water; $t_{1/2} = 3 \text{ d}$ (summer), $t_{1/2} = 7 \text{ d}$ (winter) for estuarine water; $t_{1/2} = 6 \text{ d}$ (summer), $t_{1/2} = 10 \text{ d}$ (winter) for poisoned estuarine water, based on photo-mineralization rate constants (Hwang et al. 1986);
 $t_{1/2} = 0.75 \text{ h}$ and 0.96 h , based on photochemical transformation in Xenotest 1200 (Svenson & Björndal 1988);
 $t_{1/2} = 1\text{--}110 \text{ h}$, based on aqueous photolysis half-life (Howard et al. 1991);
 photodegradation half-lives ranging from hours to days, more rapid at the surface (Howard 1991);
 photodegradation $t_{1/2} = 1.0 \text{ h}$ (summer), $t_{1/2} = 2.0 \text{ h}$ (winter) in distilled water and $t_{1/2} = 2.0 \text{ h}$ (summer), $t_{1/2} = 3.0 \text{ h}$ (winter) in estuarine water under irradiation by natural sunlight (quoted from Hwang et al. 1987, Sanders et al. 1993).
 $t_{1/2}(\text{aerobic}) = 23 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 42 \text{ d}$ in natural waters (Capel & Larson 1995)
- Ground water: $t_{1/2} = 1104\text{--}36480 \text{ h}$, based on estimated unacclimated aqueous aerobic sediment grab sample data (Delaune et al. 1983; selected, Howard et al. 1991) and unacclimated anaerobic grab sample data for ground water (Baker & Mayfield 1980; selected, Howard et al. 1991).
- Sediment: first order microbial degradation rate constant $k = 7.4 \times 10^{-4} \text{ h}^{-1}$ in sediment and water (Yoshida & Kojima 1978, quoted, Addison et al. 1983).
- Soil: Days for complete disappearance by microbial decomposition in soil suspension: $72 + \text{d}$ in Dunkirk silt loam (Alexander & Aleem 1961)
 disappearance $t_{1/2} = 23.2 \text{ d}$ from Kooyenburg soil, $t_{1/2} = 47.9 \text{ d}$ from Holten soil with earthworm *e. fetida andrei* and $t_{1/2} = 27.4 \text{ d}$ from Kooyenburg soil, $t_{1/2} = 31.8 \text{ d}$ from Holten soil with earthworm *I. rubellus* (van Gestel & Ma 1988);
 $t_{1/2} = 552\text{--}4272 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);
 $t_{1/2} = 2.0 \text{ d}$ in an acidic clay soil with $< 1.0\%$ organic matter and $t_{1/2} = 6.7 \text{ d}$ in a slightly basic sandy loam soil with 3.25% organic matter, based on aerobic batch lab microcosm experiments (Loehr & Matthews 1992).
- Biota: biological $t_{1/2} = 30 \text{ d}$ in guppy *lebistes reticulatus* (Landner et al. 1977);
 elimination $t_{1/2} = 23, 9.3, 6.9$, and 6.2 h for fat, liver muscle, and blood, respectively (rainbow trout, Call et al. 1980);
 estimated $t_{1/2} = 7.0 \text{ d}$ in trout (Niimi & Cho 1983; quoted, Niimi & Palazzo 1985);
 clearance from flagfish: $t_{1/2} = 0.68 \text{ d}$ from whole fish and $t_{1/2} = 0.68 \text{ d}$ from fish lipid (Smith et al. 1990).

TABLE 14.1.2.13.1
Reported aqueous solubilities of pentachlorophenol at various temperatures

FIGURE 14.1.2.13.2 Logarithm of vapor pressure versus reciprocal temperature for pentachlorophenol.

14.1.2.14 4-Chloro-*m*-cresol

Common Name: 4-Chloro-*m*-cresol

Synonym: *p*-chloro-*m*-cresol, 2-chloro-5-hydroxytoluene, 4-chloro-3-methylphenol

Chemical Name: 4-chloro-*m*-cresol, 4-chloro-3-methylphenol

CAS Registry No: 59-50-7

Molecular Formula: C_7H_7ClO , $CH_3(Cl)C_6H_3OH$

Molecular Weight: 142.583

Melting Point ($^{\circ}C$):

67 (Lide 2003)

Boiling Point ($^{\circ}C$):

235.0 (Weast 1977; Callahan et al. 1979; Dean 1985; Lide 2003)

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

Molar Volume (cm^3/mol):

146.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, $F: 0.387$ (mp at $67^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

3990 (shake flask-UV with buffer at pH 5.1, Blackman et al. 1955)

3990 (IUPAC selected, Horvath & Getzen 1985)

3650 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)

Vapor Pressure (Pa at $25^{\circ}C$):

6.67 (Mabey et al. 1982)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

0.253 ($20^{\circ}C$, calculated-P/C, Mabey et al. 1982)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.18 (Hansch & Leo 1979)

2.95 (calculated as per Tute 1971, Callahan et al. 1979)

3.10 (HPLC-RT correlation, Veith et al. 1979)

3.10 (recommended, Sangster 1993)

3.10 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

2.60 (microorganisms-water, calculated- K_{ow} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{oc}$:

2.78 (sediment-water, calculated- K_{ow} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Oxidation: rate constants $k < 7 \times 10^5 M^{-1} h^{-1}$ for singlet oxygen and $k = 1 \times 10^7 M^{-1} h^{-1}$ for peroxy radical (Mabey et al. 1982).

Biotransformation: bacterial transformation $k = 3 \times 10^{-9} mL cell^{-1} h^{-1}$ in water (Mabey et al. 1982).

Half-Lives in the Environment:

14.1.3 NITROPHENOLS

14.1.3.1 2-Nitrophenol

Common Name: 2-Nitrophenol

Synonym: *o*-nitrophenol, 2-hydroxynitrobenzene

Chemical Name: 2-nitrophenol

CAS Registry No: 88-75-5

Molecular Formula: $C_6H_5NO_2$, $C_6H_4(NO_2)OH$

Molecular Weight: 139.109

Melting Point ($^{\circ}C$):

44.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

216.0 (Weast 1982-83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.485, 1.2942 (14, $40^{\circ}C$, Weast 1982-83)

131.9 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

7.21 (Pearce & Simkins 1968)

7.23 (Serjeant & Dempsey 1979)

8.28 (Mabey et al. 1982)

7.22 (Dean 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.57 (Tsonopoulos & Prausnitz 1971)

17.44 (Beneš & Dohnal 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

55.23 (Tsonopoulos & Prausnitz 1971)

48.95, 56.5 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.630 (mp at $44.8^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

3210* ($38.4^{\circ}C$, shake flask-residue volume method, measured range 34.8 – $196^{\circ}C$, critical solution temp above $200^{\circ}C$, Sidgwick et al. 1915)

1390, 1095 ($20^{\circ}C$, shake flask-UV, calculated, Hashimoto et al. 1984)

1080* ($20 \pm 0.5^{\circ}C$, shake flask-UV with buffer at pH 1.5, measured range 5 – $30^{\circ}C$, Schwarzenbach et al. 1985)

2100 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)

1697* ($24.8^{\circ}C$, shake flask-conductimetry, measured range 15.6 – $34.7^{\circ}C$, Achard et al. 1996)

1350* ($20^{\circ}C$, shake flask-UV spectrophotometry, measured range 10 – $40^{\circ}C$, Beneš & Dohnal 1999)

1169* ($17.35^{\circ}C$, shake flask-optical method, measured range 290.5 – $322.7\ K$, Jaoui et al. 2002)

$\ln [S/(mol\ kg^{-1})] = 16.237 - 4672.3/(T/K)$; temp range 288 – $308\ K$ (eq. derived using reported exptl. data, Jaoui et al. 2002)

$\ln [S/(mol\ kg^{-1})] = 6.9022 - 1784.4/(T/K)$; temp range 308 – $332\ K$ (eq. derived using reported exptl. data, Jaoui et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

29.10* (extrapolated-regression of tabulated data, temp range 49.3 – $214.5^{\circ}C$, Stull 1947)

$\log (P/mmHg) = [-0.2185 \times 12497.3/(T/K)] + 8.497320$; temp range 49.3 – $214.5^{\circ}C$ (Antoine eq., Weast 1972-73)

- 24.43 (extrapolated-Cox eq., Chao et al. 1983)
 $\log (P/\text{mmHg}) = [1 - 487.905/(T/K)] \times 10^4 \{0.885400 - 6.30106 \times 10^{-4} \cdot (T/K) + 6.42867 \times 10^{-7} \cdot (T/K)^2\}$; temp range: 322.5–487.7 K (Cox eq., Chao et al. 1983)
 12.4 \pm 0.2 (gas saturation-HPLC/UV, Sonnefeld et al. 1983)
 17.25 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 7.8446 - 2864.6/(T/K)$, temp range 273–292 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.04963 - 1571.7/(-101.17 + T/K)$, temp range 366–490 K (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)
 18.86 (supercooled liquid P_L at 20°C, GC-RT correlation, Schwarzenbach et al. 1988)
 10.61 (20°C, solid P_s , converted from P_L with ΔS_{fus} and mp, Schwarzenbach et al. 1988)
 $\log (P/\text{atm}) = 5.735 - 2776/(T/K)$ (Antoine eq., GC-RT correlation, Schwarzenbach et al. 1988)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.766 (calculated-P/C, Mabey et al. 1982)
 0.355 (Leuenberger et al. 1985)
 1.367 (20°C, calculated-P/C, Schwarzenbach et al. 1988)
 1.25* (gas stripping-UV, measured range 5–40°C, Müller & Heal 2001)
 $\ln [H/(M \text{ atm}^{-1})] = 6290/(T/K) - 16.6$; temp range 278–303 K (gas stripping-UV, Müller & Heal 2001)
 1.178* (gas stripping-UV, measured range 284–302 K, Harrison et al. 2002)
 $\ln [H/(M \text{ atm}^{-1})] = 6270/(T/K) - 16.6$; temp range 284–302 K, Harrison et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{\text{ow}}$:

- 1.79 (shake flask-UV, Fujita et al. 1964; quoted, Leo et al. 1971)
 2.00 (shake flask, Umeyama et al. 1971)
 1.25, 1.18 (calculated-fragment const., calculated- π const., Rekker 1977)
 1.79 (shake flask, Korenman et al. 1977)
 1.68 (shake flask at pH 7, Unger et al. 1978)
 1.35 (HPLC-RT correlation, Veith et al. 1979)
 1.91 (HPLC-RT correlation, Miyake et al. 1986)
 1.89 ($21.5 \pm 0.5^\circ\text{C}$, shake flask-UV with buffer at pH 1.5, Schwarzenbach et al. 1988)
 1.76 (shake flask-UV, Kramer & Henze 1990)
 1.68 (CPC-RV at pH 7.4, El Tayar et al. 1991)
 2.24 (HPLC-RT correlation, Saito et al. 1993)
 1.77 (recommended, Sangster 1993)
 1.85, 1.79 (COMPUTOX databank, Kaiser 1993)
 1.79, 1.68 (recommended, value at pH 7.4; Hansch et al. 1995)
 2.03 (solid-phase microextraction, Dean et al. 1996)
 1.63, 1.99, 2.28, 1.90 (HPLC- k' correlation, different combinations of stationary and mobile phases under isocratic conditions, Makovskaya et al. 1995a)

Bioconcentration Factor, $\log \text{BCF}$:

- 2.10 (bluegill sunfish, Veith et al. 1980)
 1.23 (microorganisms-water, calculated- K_{ow} , Mabey et al. 1982)
 1.15 (calculated- K_{ow} , Howard 1989)

Sorption Partition Coefficient, $\log K_{\text{oc}}$:

- 1.43 (sediment-water, calculated- K_{ow} , Mabey et al. 1982)
 1.81 (soil, calculated-S, quoted, Howard 1989)
 2.17; 2.50 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1998)
 2.424, 1.507, 1.852, 1.763, 2.336 (first generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV, Gawlik et al. 1998, 1999)
 2.043, 1.758, 1.854, 1.708, 2.283 (second generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV, Gawlik et al. 1999)

2.043, 1.758, 1.854, 1.708, 2.283 (second generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV and HPLC- k' correlation, Gawlik et al. 2000)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: volatilization $t_{1/2} = 296$ h from a model river was estimated using Henry's law constant for a model river of 1 m deep with 1 m/s current and a 3 m/s wind (Howard 1989)

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

rate constant $k < 2 \times 10^5 \text{ M}^{-1}\cdot\text{h}^{-1}$ for singlet oxygen, and $k = 2 \times 10^6 \text{ M}^{-1}\cdot\text{h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982);

$k_{OH} = 0.922 \times 10^{-12} \text{ cm}^3\cdot\text{molecule}^{-1}\cdot\text{s}^{-1}$ at 296 K (Becker et al. 1984; quoted, Carrier et al. 1986);

$k_{OH}(\text{exptl}) = 0.92 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 3.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

$k_{OH}(\text{exptl}) = 0.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 4.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1987)

$k_{OH} = 0.90 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 294 K (Atkinson 1989)

photooxidation $t_{1/2} = 7\text{--}71$ h, based on measured rate data for the vapor phase reaction with OH radical in air (Howard et al. 1991)

$k_{O_3} = 2.0 \times 10^{-23} \text{ cm}^3\cdot\text{molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 298–323 K (quoted, Atkinson & Carter 1984)

$k_{OH} = (2.34 \pm 0.33) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $(24.6 \pm 0.4)^\circ\text{C}$ (Edney et al. 1986)

$k_{OH} = 2.34 \times 10^{-12} \text{ cm}^3\cdot\text{molecule}^{-1} \text{ s}^{-1}$ at 298 K, $k_{NO_3} = 9.7 \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (Atkinson 1990)

$k_{NO_3} < 0.02 \times 10^{-12} \text{ cm}^3\cdot\text{molecule}^{-1} \text{ s}^{-1}$ at 296 K and $k_{OH} = 0.90 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

aqueous photooxidation $t_{1/2} = 480$ min in the presence of hydrogen peroxide, irradiated with a mercury-xenon lamp (Lipczynska-Kochany 1992)

photo-transformation decay rate constant $k = 0.27 \text{ min}^{-1}$ on 0.2 g/L of TiO_2 solution (Minero et al. 1993).

Hydrolysis: resistant to hydrolysis (Howard 1989).

Biodegradation: 95% degradation in 3–6 d in mixed bacteria cultures (Tabak et al. 1964);

average rate of biodegradation $14.0 \text{ mg COD g}^{-1}\cdot\text{h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

time necessary for complete degradation of 16 mg/L in 3–5 d by wastewater and 7–14 d by soil (Haller 1978);

aqueous aerobic $t_{1/2} = 168\text{--}672$ h, based on unacclimated aerobic screening test data (Sasaki 1978; Gerike & Fischer 1979; selected, Howard et al. 1991);

aqueous anaerobic $t_{1/2} = 168\text{--}672$ h, based on anaerobic soil grab sample data (Sudhakar-Barik & Sethunathan 1978; selected, Howard et al. 1991).

Biotransformation: estimated bacterial transformation rate constant of $2 \times 10^{-9} \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 14$ h for the gas phase reaction with hydroxyl radical (GEMS 1986; quoted, Howard 1989)

photooxidation $t_{1/2} = 7\text{--}71$ h, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991).

Surface water: $t_{1/2} = 168\text{--}672$ h, based on aerobic river die-away test data (Ludzack et al. 1958; selected value, Howard et al. 1991);

volatilization $t_{1/2} = 12$ d from a model river was estimated using Henry's law constant for a model river of 1 m deep with 1 m/s current and a 3 m/s wind and $t_{1/2} = 1\text{--}8$ d in freshwater (Howard 1989);

calculated $t_{1/2} = 390$ h for a body of water with 1 m in depth (Schmidt-Bleek et al. 1982; quoted, Howard 1989);

photooxidation $t_{1/2} = 480$ min in the presence of hydrogen peroxide, irradiated with a mercury-xenon lamp (Lipczynska-Kochany 1992).

Groundwater: $t_{1/2} = 336\text{--}672$ h, based on estimated aqueous aerobic and anaerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 10$ d in flooded soil (Howard 1989);

$t_{1/2}$ = 168–672 h, based on estimated aqueous aerobic biodegradation half-life and anaerobic soil grab sample data (Sudhakar-Barik & Sethunnathan 1978; selected, Howard et al. 1991).

Biota:

14.1.3.2 3-Nitrophenol

Common Name: 3-Nitrophenol

Synonym: *m*-nitrophenol

Chemical Name: 3-nitrophenol

CAS Registry No: 554-84-7

Molecular Formula: $C_6H_5NO_2$, $C_6H_4(NO_2)OH$

Molecular Weight: 139.109

Melting Point (°C):

96.8 (Lide 2003)

Boiling Point (°C):

194.0 (at 70 mm Hg, Weast 1982–83)

Density (g/cm³ at 20°C):

1.2797 (10°C, Verschueren 1983)

Molar Volume (cm³/mol):

108.7 (100°C, Stephenson & Malanowski 1987)

131.9 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a:

8.00 (Fieser & Fieser 1958)

8.36 (Serjeant & Dempsey 1979; Dean 1985; Howard 1989; Haderlein & Schwarzenbach 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

21.34 (Tsonopoulos & Prausnitz 1971)

19.20 (Beneš & Dohnal 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

57.74 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56$ J/mol K), F: 0.197 (mp at 96.8°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

30300* (40.4°C, shake flask-residue volume method, measured range 40.4–98.7°C, critical solution temp 98.7°C, Sidgwick et al. 1915)

13000 (shake flask-UV spectrophotometry, Roberts et al. 1977)

11546 (20°C, shake flask-UV, Hashimoto et al. 1984)

10800* (20°C, shake flask-UV spectrophotometry, measured range 10–40°C, Beneš & Dohnal 1999)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

3.83×10^{-2} (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_s/\text{kPa}) = 8.93697 - 3981.386/(T/\text{K})$, temp range 305–334 K (solid, Antoine eq., Stephenson & Malanowski 1987)

99.98 (Weber et al. 1981)

Henry's Law Constant (Pa·m³/mol at 25°C):

2.203×10^{-4} (quoted, Gaffney et al. 1987)

1.033 (calculated-P/C, Howard 1989)

Octanol/Water Partition Coefficient, $\log K_{\text{ow}}$:

2.00 (shake flask-UV, Fujita et al. 1964; Leo et al. 1971)

2.00 (shake flask-UV at pH 5.6, Umeyama et al. 1971)

2.00 (20°C, shake flask, Korenman et al. 1976)

2.02	(Scherrer & Howard 1979)
1.74	(HPLC-RT correlation, Butte et al. 1981)
2.05	(Beltrame et al. 1988, 1989)
2.01, 2.03	(shake flask, HPLC-RT correlation, Wang et al. 1989)
1.88	(shake flask-UV, Kramer & Henze 1990)
1.74	(centrifugal partition chromatography CPC-RV at pH 7.4, El Tayar et al. 1991)
2.00	(recommended, Sangster 1993)
1.92, 1.51	(COMPUTOX databank, Kaiser 1993)
2.00	(recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

1.40	(goldfish, ratio of rate constant k_1/k_2 , Nagel & Urich 1980)
1.40	(<i>Brachydanio rerio</i> , Butte et al. 1987)
1.28	(estimated- K_{ow} , Howard 1989)

Sorption Partition Coefficient, log K_{OC} :

1.72	(Brookton clay loam, Boyd 1982)
1.36	(soil, estimated-S, Howard 1989)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization: volatilization $t_{1/2} = 4.2$ d from a model river was estimated using Henry's law constant for a model river of 1 m deep with 1 m/s current and a 3 m/s wind (Howard 1989).

Photolysis:

Oxidation: photooxidation $t_{1/2} \sim 14$ h, based on estimated rate data for the vapor phase reaction with hydroxyl radical in air (Howard 1989);

phototransformation decay rate $k = 0.18 \text{ min}^{-1}$ in 0.2 g/L of TiO_2 solution (Minero et al. 1993).

Hydrolysis: resistant to hydrolysis (Howard 1989).

Biodegradation: 95% degradation in 3–6 d in mixed bacteria cultures (Tabak et al. 1964);

decomposition by a soil microflora in 4 d (Alexander & Lustigman 1966; quoted, Verschuereen 1983)

complete degradation of 16 mg/L in 3–5 d by wastewater, and 3–5 d by soil (Haller 1978);

average rate of biodegradation $17.5 \text{ mg COD g}^{-1}\cdot\text{h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

$t_{1/2} = 6.3$ d or less in flooded soil under anaerobic conditions (Howard 1989)

$t_{1/2}(\text{aerobic}) = 0.76$ d, $t_{1/2}(\text{anaerobic}) = 6.8$ d in natural waters (Capel & Larson 1995).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 1.54 \text{ h}^{-1}$; $k_2 = 0.00 \text{ h}^{-1}$ (goldfish, Nagel & Urich 1980)

Half-Lives in the Environment:

Air: $t_{1/2} = 14$ h for reaction with hydroxyl radical in vapor phase (Howard 1989).

Surface water: $t_{1/2} = 4.2$ d in a model river (Howard 1989)

$t_{1/2}(\text{aerobic}) = 0.76$ d, $t_{1/2}(\text{anaerobic}) = 6.8$ d in natural waters (Capel & Larson 1995).

Groundwater:

Sediment:

Soil: $t_{1/2} = 6.3$ d in flooded soil under anaerobic conditions (Howard 1989).

Biota: elimination from goldfish within 4 h (Nagel & Urich 1980).

14.1.3.3 4-Nitrophenol

Common Name: 4-Nitrophenol

Synonym: *p*-nitrophenol, 4-hydroxynitrobenzene

Chemical Name: 4-nitrophenol

CAS Registry No: 100-02-7

Molecular Formula: $C_6H_5NO_2$, $C_6H_4(NO_2)OH$

Molecular Weight: 139.109

113.6 (Lide 2003)

Boiling Point ($^{\circ}C$):

279.0 (decomposes, Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.479 (Weast 1982–83)

Molar Volume (cm^3/mol):

131.9 (calculated-Le Bas method at normal boiling point)

Acid Dissociation Constant, pK_a :

7.08 (21.5 $^{\circ}C$, UV, Schwarzenbach et al. 1988)

7.17 (Fieser & Fieser 1958)

7.16 (Serjeant & Dempsey 1979; Howard 1989; Haderlein & Schwarzenbach 1993)

7.15 (Dean 1985; Miyake et al. 1987; Brecken-Folse et al. 1994; Howe et al. 1994)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

15.90 (Tsonopoulos & Prausnitz 1971)

18.25 (Beneš & Dohnal 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

41.09 (Tsonopoulos & Prausnitz 1971)

62.76, 56.5 (observed, estimated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.135 (mp at $113.6^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

29100* (34.8 $^{\circ}C$, shake flask-residue volume method, measured range 34.8–92.8 $^{\circ}C$, critical solution temp 92.8 $^{\circ}C$, Sidgwick et al. 1915)

14000 (shake flask-spectrophotometry, Roberts et al. 1977)

9950, 14800 (15, 25 $^{\circ}C$, shake flask, average values of 6 laboratories, OECD 1981)

13490, 11140 (20 $^{\circ}C$, shake flask-UV, calculated, Hashimoto et al. 1984)

11570 (20 \pm 0.5 $^{\circ}C$, shake flask-UV with buffer at pH 1.5, Schwarzenbach et al. 1988)

16000 (solid-phase microextraction SPME-GC, Buchholz & Pawliszyn 1994)

15599* (shake flask-conductimetry, measured range 15.3–34.9 $^{\circ}C$, Achard et al. 1996)

12200* (20 $^{\circ}C$, shake flask-UV spectrophotometry, measured range 10–38 $^{\circ}C$, Beneš & Dohnal 1999)

15052* (23.65 $^{\circ}C$, shake flask-optical method, measured range 285.9–313.8 K, Jaoui et al. 2002)

$\ln [S/(mol\ kg^{-1})] = 17.110 - 4273.4/(T/K)$; temp range 288–314 K (eq. derived using reported exptl. data, Jaoui et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0054 (20 $^{\circ}C$, Schmidt-Bleek et al. 1982)

0.0012 (selected, Yoshida et al. 1983)

0.0044 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_s/kPa) = 11.9529 - 5159.7/(T/K)$, temp range 304–352 K (solid, Antoine eq., Stephenson & Malanowski 1987)

- 0.111 (supercooled liquid P_L at 20°C, GC-RT correlation, Schwarzenbach et al. 1988)
 0.0131 (20°C, solid P_S , converted from P_L with ΔS_{fus} and mp, Schwarzenbach et al. 1988)
 $\log(P/\text{mmHg}) = 8.305 - 4180/(T/K)$ (Antoine eq., GC-RT correlation, Schwarzenbach et al. 1988)
 0.133 (Howard 1989)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

- 4.21×10^{-5} (exptl., Hine & Mookerjee 1975)
 5.55×10^{-4} , 9.87×10^{-3} (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 1.04×10^{-5} (calculated-P/C, Yoshida et al. 1983)
 0.00335 (20°C, calculated-P/C, Schwarzenbach et al. 1988)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 1.91 (shake flask-UV, Fujita et al. 1964; quoted, Leo et al. 1971; Hansch & Leo 1979)
 1.18, 1.27 (calculated- π const., calculated-fragment const., Rekker 1977)
 1.68 ± 0.01 (RP-HPLC- k' correlation, Unger et al. 1978)
 2.07 (RP-HPLC- k' correlation, Miyake & Terada 1982)
 1.86 (HPLC-ref. substances extrapolated, Harnish et al. 1983)
 1.88 (shake flask average, OECD/EEC lab. comparison tests, Harnish et al. 1983)
 1.96 ± 0.08 (HPLC-RV correlation.-ALPM, Garst 1984; Garst & Wilson 1984)
 1.85, 1.92 (shake flask, OECD 1981 Guidelines, Geyer et al. 1984)
 0.70 (calculated- γ from UNIFAC, Campbell & Luthy 1985)
 1.90 (HPLC-RV correlation, Brooke et al. 1986)
 2.10 (HPLC- k' correlation, Miyake et al. 1987)
 1.93 (shake flask/batch equilibration-UV, Beltrame et al. 1988, 1989)
 2.04 ($21.5 \pm 1.5^\circ\text{C}$, shake flask-UV with buffer at pH 1.5, Schwarzenbach et al. 1988)
 1.77 (CPC-RV at pH 7.4, El Tayar et al. 1991)
 1.85, 1.91 (COMPUTOX databank, Kaiser 1993)
 1.91 (recommended, Sangster 1993)
 1.90 ± 0.14 , 1.09 ± 0.53 (solvent generated liquid-liquid chromatography SGLLC-correlation, RP-HPLC- k' correlation, Cichna et al. 1995)
 1.91 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

- 2.10 (fathead minnow, Veith et al. 1980)
 2.56 (mean whole body ^{14}C in fathead minnow, Call et al. 1980)
 1.90, 2.34 (total ^{14}C in fathead minnow: observed, calculated, mean exposure level $0.0041 \mu\text{g}\cdot\text{mL}^{-1}$, Call et al. 1980)
 2.44, 2.65 (total ^{14}C in fathead minnow: observed, calculated, mean exposure level $0.0441 \mu\text{g}\cdot\text{mL}^{-1}$, Call et al. 1980)
 1.76; 1.04 (golden orfe; green algae, Freitag et al. 1982)
 1.48 (activated sludge, Freitag et al. 1982)
 1.43 (microorganisms-water, calculated- K_{ow} , Mabey et al. 1982)
 0.301 (calculated- K_{ow} , Yoshida et al. 1983)
 1.48, 1.45 (alga *Chlorella fusca*, wet wt. basis, calculated- K_{ow} , Geyer et al. 1984)
 1.60, 1.48, 1.48 (golden ide, algae, activated sludge, Freitag et al. 1985)
 1.90 (fathead minnow, quoted, Howard 1989)

Sorption Partition Coefficient, $\log K_{oc}$:

- 1.65 (sediment-water, calculated- K_{ow} , Mabey et al. 1982)
 2.41 (soil, calculated- K_{ow} , Yoshida et al. 1983)
 1.74 (Brookston clay loam, Boyd 1982)
 2.18 (HPLC- k' correlation, cyanopropyl column, mobile phase buffered to pH 3, Hodson & Williams 1988)
 1.32 (soil, calculated-S, Howard 1989)
 2.37 (soil, quoted exptl., Meylan et al. 1992)
 2.49 (soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)

- 2.16, 2.07 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)
 2.05; 2.49 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1998)
 2.03, 1.94 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, and $pH \leq 5.4$, average, Delle Site 2001)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: atmospheric photolysis $t_{1/2} = 3.1\text{--}329$ h, based on sunlight photolysis at pH 9 and pH 4 (Hustert et al. 1981; Lemaire et al. 1985; selected, Howard et al. 1991);
 rate constant $k = 3.96 \times 10^{-3} \text{ h}^{-1}$ for the direct photolysis in water (Yoshida et al. 1983);
 photolysis $t_{1/2}$ range from hours to a week or more in atmosphere and $t_{1/2} = 2\text{--}14$ d in clear surface waters (Howard 1989).

Oxidation: oxidation rate constant $k < 2 \times 10^5 \text{ M}^{-1}\cdot\text{h}^{-1}$ for singlet oxygen, $k = 2 \times 10^6 \text{ M}^{-1}\cdot\text{h}^{-1}$ for peroxy radical (Mabey et al. 1982);

photooxidation $t_{1/2} = 21$ d to 5.6 y in water, based on rate constants for reaction in water with hydroxyl radical (Dorfman & Adams 1973; Scully & Hoigné 1987; selected, Howard et al. 1991);

rate constant $k < 50 \text{ M}^{-1}\cdot\text{s}^{-1}$ for 0.01–14 mM to react with ozone in water using PrOH as scavenger at pH 1.7 and 20–23°C in water (Hoigné & Bader 1983a,b);

rate constant $k = 8.3 \times 10^{-12} \text{ cm}^3\cdot\text{molecule}^{-1}\cdot\text{s}^{-1}$ for the gas-phase reaction with OH radical at 296 K in the atmosphere (Becker et al. 1984; quoted, Carlier et al. 1986);

photooxidation $t_{1/2} = 14.5\text{--}145$ h in air, based on estimated rate data for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991);

aqueous photooxidation $t_{1/2} = 440$ min in the presence of hydrogen peroxide, irradiated with a mercury-xenon lamp (Lipczynska-Kochany 1992);

phototransformation decay $k = 0.15 \text{ min}^{-1}$ on 0.20 g/L of TiO_2 solution (Minero et al. 1993).

Hydrolysis:

Biodegradation: 95% degradation in 3–6 d in mixture bacteria cultures (Tabak et al. 1964);

decomposition by a soil microflora in 16 d (Alexander & Lustigman 1966; quoted, Verschueren 1983);

average rate of biodegradation $17.5 \text{ mg COD g}^{-1}\cdot\text{h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

time necessary for complete degradation of 16 mg/L in 3–5 d by wastewater and 7–14 d by soil (Haller 1978);

aqueous aerobic $t_{1/2} = 18.2\text{--}168$ h, based on pond die-away test data (Paris et al. 1983; Bourquin 1984; selected, Howard et al. 1991);

aqueous anaerobic $t_{1/2} = 163\text{--}235$ h, based on anaerobic die-away data in two different flooded soils (Sudhakar-Barik & Sethunnathan 1978; selected, Howard et al. 1991);

was not biodegraded with activated sludge at a concn. of 94 mg/L but completely degraded with a decreased concn. of 19 mg/L in 28 d expt. (Kool 1984).

Biotransformation: estimated bacterial transformation rate constant of $1.00 \times 10^{-7} \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ in water (Mabey et al. 1982);

rate constant of $(3.80 \pm 1.40) \times 10^{-11} \text{ L}\cdot\text{organism}^{-1}\cdot\text{h}^{-1}$ (Paris et al. 1983; quoted, Steen 1991).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 14.5\text{--}145$ h, based on estimated rate data for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991);

atmospheric transformation lifetime was estimated to be 1–5 to > 5 d (Kelly et al. 1994).

Surface water: photodegradation $t_{1/2} = 5.7$ d at pH 5, $t_{1/2} = 6.7$ d at pH 7 and $t_{1/2} = 13.7$ d at pH 9 in water (Hustert et al. 1981);

$t_{1/2} = 1\text{--}8$ d in freshwater, $t_{1/2} = 1\text{--}3$ yr in marine systems but decreased to 13–20 d with the presence of sediment, the mean $t_{1/2} = 7.7$ d estimated by a nonsteady-state equilibrium model, and photolysis $t_{1/2} = 2\text{--}14$ d in clear surface waters (Howard 1989);

$t_{1/2} = 18.2\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

$t_{1/2} = 440$ min for photolysis in the presence of hydrogen peroxide, irradiated with a mercury-xenon lamp (Lipczynska-Kochany 1992).

Groundwater: $t_{1/2}$ = 36.4–235 h, based on pond die-away test data and anaerobic die-away data in two different flooded soils (Paris et al. 1983; Sudhakar-Barik & Sethunnathan 1978; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2}$ ~ 1 d in agricultural topsoil and $t_{1/2}$ = 10 d in flooded soil, $t_{1/2}$ > 40 d in subsoil under aerobic conditions and longer still under anaerobic conditions (Howard 1989);

$t_{1/2}$ = 17–29 h, based on aerobic soil die-away test data (Loekke 1985; selected, Howard et al. 1998).

$t_{1/2}$ = 75 d in a coarse sandy soil, $t_{1/2}$ = 145 d in sandy loam (Kjeldsen et al. 1990)

Biota: depuration $t_{1/2}(\text{obs.})$ = 72 h, $t_{1/2}(\text{calc.})$ = 37 h for mean exposure level of $0.0041 \mu\text{g}\cdot\text{mL}^{-1}$ and $t_{1/2}(\text{obs.})$ = 228 h, $t_{1/2}(\text{calc.})$ = 206 h for mean exposure level of $0.041 \mu\text{g}\cdot\text{mL}^{-1}$ (Call et al. 1980).

3.09	(activated carbon, Blum et al. 1994)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: aqueous oxidation rate constants $k = 3 \times 10^4 \text{ M}^{-1}\cdot\text{h}^{-1}$ for singlet oxygen, and $k = 5 \times 10^5 \text{ M}^{-1}\cdot\text{h}^{-1}$ for peroxy radical (Mabey et al. 1982);

photooxidation $t_{1/2} = 77\text{--}3840 \text{ h}$ in water, based on reported reaction rate constants for RO_2 with the phenol class (Mill & Mabey 1985; selected, Howard et al. 1991);

photooxidation $t_{1/2} = 111\text{--}1114 \text{ h}$ in air, based on the estimated reaction rate constant $k = 1.7 \times 10^{-11} \text{ cm}^3\cdot\text{molecule}^{-1}\cdot\text{s}^{-1}$ with an ambient hydroxyl radical concentration of $8 \times 10^5 \text{ molecules}\cdot\text{cm}^{-3}$ for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991);

aqueous photooxidation $t_{1/2} = 200 \text{ min}$ in the presence of hydrogen peroxide irradiated with a mercury-xenon lamp (Lipczynska-Kochany 1992).

Hydrolysis:

Biodegradation: 95% degradation in 7–10 d in mixed bacteria cultures (Tabak et al. 1964);

average rate of biodegradation $6.0 \text{ mg COD g}^{-1}\cdot\text{h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

first-order rate constant $k = 0.2 \text{ d}^{-1}$ corresponding to a $t_{1/2} = 3.6 \text{ d}$ in adapted activated sludge under aerobic conditions (Mills et al. 1982);

aqueous aerobic $t_{1/2} = 1622\text{--}6312 \text{ h}$, based on data from aerobic soil column studies (Kincannon & Lin 1985; selected, Howard et al. 1991) and aerobic soil die-away test data (Sudhakar-Barik & Sethunnathan 1978; selected, Howard et al. 1991)

aqueous anaerobic $t_{1/2} = 68\text{--}170 \text{ h}$, based on anaerobic flooded soil die-away tests (Sudhakar-Barik & Sethunnathan 1978; selected, Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 68 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 2.8 \text{ d}$ in natural waters (Capel & Larson 1995)

Biotransformation: bacterial transformation rate constant $k = 3 \times 10^{-9} \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: calculated vapor-phase $t_{1/2} = 14 \text{ h}$ for reaction with photochemically generated OH radical (Howard 1989)

photooxidation $t_{1/2} = 111\text{--}1114$ h, based on estimated rate data for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991);

atmospheric transformation lifetime was estimated to be > 5 d (Kelly et al. 1994).

Surface water: calculated $t_{1/2} = 58$ d for reaction with alkylperoxy radical in water (Howard 1989);

$t_{1/2} = 77\text{--}3840$ h, based on reported reaction rate constants for RO_2 radical with the phenol class (Mill & Mabey 1985; selected, Howard et al. 1991);

photooxidation $t_{1/2} = 200$ min in the presence of hydrogen peroxide, irradiated with a mercury-xenon lamp (Lipczynska-Kochany 1992)

$t_{1/2}(\text{aerobic}) = 69$ d, $t_{1/2}(\text{anaerobic}) = 2.8$ d in natural waters (Capel & Larson 1995)

Groundwater: $t_{1/2} = 68\text{--}14624$ h, based on estimated aqueous aerobic biodegradation half-life and estimated aqueous anaerobic biodegradation half-life (quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 1622\text{--}6312$ h, based on data from aerobic soil column studies (Kincannon & Lin 1985) and aerobic soil die-away test data (Sudhakar-Barik & Sethunnathan 1978; selected, Howard et al. 1991);

a Class C compounds with a $t_{1/2} > 50$ d in soil (Ryan et al. 1988).

$t_{1/2} = 145$ d in sandy loam (Kjeldsen et al. 1990)

FIGURE 14.1.3.4.1 Logarithm of mole fraction solubility ($\ln x$) versus reciprocal temperature for 2,4-dinitrophenol.

14.1.3.5 2,4,6-Trinitrophenol (Picric acid)

Common Name: 2,4,6-Trinitrophenol

Synonym: Picric acid

Chemical Name: 2,4,6-trinitrophenol

CAS Registry No: 88-89-1

Molecular Formula: $C_6H_3N_3O_7$, $C_6H_2(NO_2)_3OH$

Molecular Weight: 229.104

Melting Point ($^{\circ}C$):

122.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

> 300 (explodes, Weast 1982–83; Dean 1985; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.763 (Weast 1982–83; Dean 1985)

Acid Dissociation Constant, pK_a :

0.78 (Schwarzenbach et al. 1988)

Molar Volume (cm^3/mol):

188.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

19.50 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

49.37 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.111 (mp at $122.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

14000 (Morrison & Boyd 1959)

13750 (selected, Tsonopoulos & Prausnitz 1971)

14000 ($20^{\circ}C$, Verschueren 1983)

13000 (Dean 1985)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

4.68×10^{-5} (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 11.319 - 5560/(T/K)$, temp range 468–598 K (liquid, Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

7.66×10^{-7} (calculated-P/C, this work)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.44 (shake flask-GC, Korenman et al. 1977)

1.34 (Scherrer & Howard 1979)

1.46 (HPLC-RV correlation, Garst 1984)

–0.97, 0.87 (shake flask, Log P database: pH 2.7, pH 1, Hansch & Leo 1987)

2.03 (shake flask, Log P Database, Hansch Leo 1987)

1.33 (recommended, Sangster 1993)

1.82 (COMPUTOX databank, Kaiser 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: photooxidation $t_{1/2} = 677\text{--}4320$ h, based on estimated reaction rates with OH and NO₃ radicals in air (Howard et al. 1991).

Hydrolysis: no hydrolyzable group (Howard et al. 1991).

Biodegradation: 95% degradation in 3–6 d in mixed bacteria cultures (Tabak et al. 1964);

aqueous aerobic $t_{1/2} = 672\text{--}8640$ h, based on aerobic biodegradation screening test (Howard et al. 1991);
aqueous anaerobic $t_{1/2} = 48\text{--}300$ h, based on aqueous anaerobic natural water die-away test data (Howard et al. 1991)

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environmental Compartments:

Air: $t_{1/2} = 672\text{--}4320$ h, based on estimated photooxidation half-lives in air (Howard et al. 1991).

Surface water: $t_{1/2} = 672\text{--}4320$ h, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).

Ground water: $t_{1/2} = 48\text{--}8640$ h, based on estimated both aqueous aerobic and aqueous anaerobic biodegradation half-lives (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on estimated photooxidation aqueous aerobic biodegradation half-lives (Howard et al. 1991).

Biota:

14.1.3.6 4,6-Dinitro-*o*-cresol

Common Name: 4,6-Dinitro-*o*-cresol

Synonym: 2,4-dinitro-6-methylphenol, DNOC, 2-methyl-4,6-dinitrophenol, 6-methyl-2,4-dinitrophenol

Chemical Name: 4,6-dinitro-*o*-cresol, 2,4-dinitro-6-methylphenol

CAS Registry No: 534-52-1

Molecular Formula: $C_7H_6N_2O_5$, $CH_3C_6H_2(NO_2)_2OH$

Molecular Weight: 198.133

Melting Point ($^{\circ}C$):

86.5 (Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

312 (Howard 1991)

Density (g/cm^3 at $20^{\circ}C$):

Acid Dissociation Constant, pK_a :

4.35 (Pearce & Simkins 1968; Callahan et al. 1979; Westall et al. 1985)

4.31 (Schwarzenbach et al. 1988; Howard 1991)

4.46 (Jafvert 1990; quoted, Bintein & Devillers 1994)

Molar Volume (cm^3/mol):

182.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, $F: 0.249$ (mp at $86.5^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

258, 250 (Günther et al. 1968)

290 (calculated- K_{ow} , Mabey et al. 1982)

198 ($20^{\circ}C$, neutral species at pH 1.5 of buffer solution HCl/NaH_2PO_4 , shake flask-UV, Schwarzenbach et al. 1988)

150 ($20^{\circ}C$, quoted, Howard 1991)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.048 ($35^{\circ}C$, Knudsen effusion method, Hamaker & Kerlinger 1969)

6.670 ($20^{\circ}C$, estimated, Mabey et al. 1982)

0.0142 (interpolated-Antoine eq., solid, Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 13.265 - 5400/(T/K)$; temp range 290–324 K (Antoine eq., solid, Stephenson & Malanowski 1987)

0.240 ($20^{\circ}C$, GC-RT correlation, supercooled liquid value P_L , Schwarzenbach et al. 1988)

0.0432 ($20^{\circ}C$, solid P_s , Schwarzenbach et al. 1988)

0.0111 ($20^{\circ}C$, quoted, Howard 1991)

Henry's Law Constant ($Pa \cdot m^3/mol$):

4.050 (calculated- P/C , Mabey et al. 1982)

43.22 ($20^{\circ}C$, calculated- P/C , Schwarzenbach et al. 1988)

Octanol/Water Partition Coefficient, $\log K_{ow}$ at $25^{\circ}C$ or as indicated:

2.70 (calculated-fragment const., Mabey et al. 1982)

2.12 ($21.5^{\circ}C$, neutral species, shake flask-UV, Schwarzenbach et al. 1988)

−0.81 ($21.5^{\circ}C$, ionic species at pH 12, Schwarzenbach et al. 1988)

2.12 (Howard 1991)

- 2.12 (Sangster 1993)
 2.56, 1.98 (COMPUTOX databank, Kaiser 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 2.10 (microorganism-water, calculated- K_{OW} , Mabey et al. 1982)
 1.38, 1.57 (calculated-S, K_{OW} regression equations., Howard 1991)

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.38 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 3.57 ± 0.130 (natural sediment, Jafvert 1990)
 2.44, 2.0–2.53 (calculated-S, K_{OW} regression eq., Howard 1991)
 2.41, 2.78 (soil, quoted, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
 3.28 (activated carbon, Blum et al. 1994)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: nonvolatile from water, based on low Henry's law constant value (Howard 1991).

Photolysis:

Oxidation: aqueous oxidation rate constant $k = 3 \times 10^4 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 5 \times 10^5 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982);
 photooxidation $t_{1/2} = 77\text{--}3840 \text{ h}$ in water, based on reported reaction rate constants for RO_2 radical with the phenol class (Mill & Mabey 1985; selected, Howard et al. 1991);
 photooxidation $t_{1/2} = 310\text{--}3098 \text{ h}$ in air, based on estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; selected, Howard et al. 1991).

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 168\text{--}504 \text{ h}$, based on data from a soil die-away study (Kincannon & Lin 1985; selected, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 68\text{--}170 \text{ h}$, based on flooded soil die-away tests for 2,4-dinitrophenol (Sudhakar-Barik & Sethunnathan 1978; selected, Howard et al. 1991)
 $t_{1/2}(\text{aerobic}) = 7 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 28 \text{ d}$ in natural waters (Capel & Larson 1995)

Biotransformation: estimated bacterial transformation rate constant $k = 3 \times 10^9 \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ in water (Mabey et al. 1982).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 310\text{--}3098 \text{ h}$ in air, based on estimated rate constant for the vapor phase reaction with OH radical in air (Atkinson 1987; selected, Howard et al. 1991);
 $t_{1/2} = 77 \text{ d}$ for the vapor-phase reaction with OH radical (concn. of $5 \times 10^5 \text{ molecule}\cdot\text{cm}^{-3}$) (Howard 1991);
 atmospheric transformation lifetime was estimated to be $> 5 \text{ d}$ (Kelly et al. 1994).

Surface water: photooxidation $t_{1/2} = 77\text{--}3840 \text{ h}$ in water, based on reported reaction rate constants for RO_2 radical with the phenol class (Mill & Mabey 1985; selected, Howard et al. 1991);
 $t_{1/2} \sim 58 \text{ d}$, estimated for photooxidation via peroxy radicals and $t_{1/2} = 2600 \text{ yr}$ for reaction with singlet oxygen in water (Howard 1991)
 $t_{1/2}(\text{aerobic}) = 7 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 2.8 \text{ d}$ in natural waters (Capel & Larson 1995)

Ground water: $t_{1/2} = 68\text{--}1008 \text{ h}$, based on estimated aqueous aerobic and anaerobic biodegradation half-lives (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 168\text{--}504 \text{ h}$, based on data from a soil die-away study (Kincannon & Lin 1985; selected, Howard et al. 1991).

Biota:

14.1.4 DIHYDROXYBENZENES, METHOXYPHENOLS AND CHLOROGUAIACOLS**14.1.4.1 Catechol (1,2-Dihydroxybenzene)**

Common Name: Catechol

Synonym: 1,2-dihydroxybenzene, 1,2-benzenediol, pyrocatechol

Chemical Name: 1,2-dihydroxybenzene

CAS Registry No: 120-80-9

Molecular Formula: $C_6H_4(OH)_2$

Molecular Weight: 110.111

Melting Point ($^{\circ}C$):

104.6 (Lide 2003)

Boiling Point ($^{\circ}C$):

245 (Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3):

1.1493 (22 $^{\circ}C$, Weast 1982–83)

Acid Dissociation Constant, pK_a :

9.40 (Fieser & Fieser 1958)

9.50 (McLeese et al. 1979)

Molar Volume (cm^3/mol):

42724, 38610 (calculated- ΔS_{fus} and mp, estimated, Yalkowsky & Valvani 1980)

43000 (Dean 1985)

Vapor Pressure (Pa at 25 $^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

666.6* (104 $^{\circ}C$, summary of literature data, temp range 104–245.5 $^{\circ}C$, Stull 1947)

1333* (118.5 $^{\circ}C$, ebulliometry, measured range 118.5–245.5 $^{\circ}C$, Vonterres et al. 1955)

$\log(P/mmHg) = [-0.2185 \times 13779.7/(T/K)] + 8.694319$; temp range 104–245.5 $^{\circ}C$ (Antoine eq., Weast 1972–73)

1.34 (extrapolated-Antoine eq., Boublik et al. 1973)

$\log(P/mmHg) = 7.57299 - 2024.422/(186.533 + t/^{\circ}C)$; temp range 118.5–245.5 $^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1973)

$\log(P/mmHg) = [1 - 517.477/(T/K)] \times 10^{0.902426 - 6.04783 \times 10^{-4} \cdot (T/K) + 6.58278 \times 10^{-7} \cdot (T/K)^2}$; temp range: 377.15–518.65 K, (Cox eq., Chao et al. 1983)

5.44 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 7.9896 - 3144.241/(281.825 + t/^{\circ}C)$; temp range 118.5–245.5 $^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

1.03(extrapolated-Antoine eq., Dean 1985)

$\log (P/\text{mmHg}) = 7.577 - 2054/(187.0 + t/^{\circ}\text{C})$; temp range 118–246°C (Antoine eq., Dean 1985, 1992)

1.06(P_L , extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.61028 - 1954.6/(-94.25 + T/\text{K})$; temp range 395–519y K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

0.022 (calculated-P/C)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.86 (shake flask-UV, Fujita et al. 1964)
 0.95 (Leo et al. 1971)
 0.85 (shake flask-UV, pH 5.6, Umeyama et al. 1971)
 0.84 (shake flask, Korenman 1972)
 0.86 (shake flask at pH 7, Unger et al. 1978)
 0.88, 1.01, 0.85, 0.84 (literature values, Hansch & Leo 1979)
 0.95 (GC-RT correlation, Veith et al. 1979)
 1.10 (HPLC-RT correlation, Butte et al. 1981)
 0.53 (HPLC- k' correlation, Haky & Young 1984)
 1.10 (HPLC-RT correlation, Webster et al. 1985)
 0.88 (recommended, LOGKOW databank, Sangster 1993)
 0.88 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

2.03 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 1.42; 1.74, 2.25, 2.01, 1.98, 1.82 (soil: calculated- K_{OW} ; HPLC-screening method using LC-columns of different stationary phases, Szabo et al. 1999)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $t_{1/2} < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982);

photooxidation $t_{1/2} = 2.6\text{--}26 \text{ h}$ in air, based on vapor-phase reaction rate constant with OH radical in atmosphere (Howard et al. 1991);

aqueous photooxidation $t_{1/2} = 77\text{--}3840 \text{ h}$, based on reaction rate constant for RO_2^- radical in aqueous solution (Mill & Mabey 1985; selected, Howard et al. 1991).

Hydrolysis:

Biodegradation: 95% degradation in 1–2 d in mixed bacteria cultures (Tabak et al. 1964);

average rate of biodegradation $k = 55.5 \text{ mg COD g}^{-1} \cdot \text{h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

2 mM catechol rapidly degraded by strain Cat $_{1/2}$ in batch culture in 9 d (Schnell et al. 1989);

aqueous aerobic $t_{1/2} = 24\text{--}168 \text{ h}$, based on aerobic biological screening test data (Heukelekian & Rand 1955; Okey & Bogan 1965; Pitter 1976; Urushigawa et al. 1983; Gerike & Fischer 1979; selected, Howard et al. 1991);

aqueous anaerobic $t_{1/2} = 96\text{--}672 \text{ h}$, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environmental Compartments:

Air: $t_{1/2} = 24\text{--}168 \text{ h}$, based on estimated photooxidation half-lives in air (Atkinson 1987; selected, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be 1 d (Kelly et al. 1994).

Surface water: $t_{1/2} = 24\text{--}168 \text{ h}$, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).

Ground water: $t_{1/2} = 48\text{--}336$ h, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).

Biota:

 70000 (20–25 $^{\circ}C$, Geyer et al. 1981)
 70000 (Rott et al. 1982; Verschuere 1983; Dean 1985)
 86450 (Windholz 1983)

Vapor Pressure (Pa at 25 $^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* (132.4 $^{\circ}C$, summary of literature data, temp range 132.4–286.2 $^{\circ}C$, Stull 1947)

$\log (P/mmHg) = [-0.2185 \times 18734.0/(T/K)] + 10.309301$; temp range 132.4–286.2 $^{\circ}C$ (Antoine eq., Weast 1972–73)

0.00276* (gas saturation, extrapolated - Antoine eq., measured range 68–126 $^{\circ}C$, Bender et al. 1983)

$\log (P/mmHg) = [1 - 558.031/(T/K)] \times 10^4 \{0.941185 - 5.32724 \times 10^{-4} \cdot (T/K) + 5.41185 \times 10^{-7} \cdot (T/K)^2\}$; temp range: 432.25–559.15 K, (Cox eq., Chao et al. 1983)

0.03940 (extrapolated - liquid, Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 7.41617 - 2397.626/(194.743 + t/^{\circ}C)$; temp range 159.1–286 $^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

0.00255 (P_s , interpolated, Antoine eq., Stephenson & Malanowski 1987)

$\log (P_s/kPa) = 12.585 - 5420/(T/K)$; temp range 298–346 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 7.00575 - 2321.92/(-95.235 + T/K)$; temp range 448–559 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

- 3.89×10^{-6} (quoted, Meylan & Howard 1991)
- 5.91×10^{-6} (estimated-bond contribution, Meylan & Howard 1991)
- 4.00×10^{-6} (calculated-P/C, this work)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 0.59 (Leo et al. 1971)
- 0.495 (shake flask-UV at pH 5.62, Umeyama et al. 1971)
- 0.59 (shake flask-GC, Kurihara et al. 1973)
- 0.61 (20°C , shake flask, Korenman 1974)
- 0.55, 0.59 (shake flask, OECD 1981 Guidelines, Geyer et al. 1984)
- 0.61 (HPLC-RT correlation, Nahum & Horvath 1980)
- 0.54 (shake flask-HPLC, Nahum & Horvath 1980)
- 0.99 (HPLC-RT correlation, Fujisawa & Masuhara 1981)
- 0.50 (shake flask, Log P Database, Hansch & Leo 1987)
- 0.50 (centrifugal partition chromatography CPC, Berthod et al. 1988)
- 0.59 (shake flask, Wang et al. 1989)
- 0.59 (recommended, Sangster 1993)
- 0.59 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

- 1.81 (green algae, *Chlorella*, exposure to $50 \mu\text{g/L}$ for 24 h, Geyer et al. 1981)
- 0.95 (calculated-S, Geyer et al. 1981)
- 1.60, 2.72 (golden orfe, activated sludge, Freitag et al. 1982)
- 1.60, 1.60 (algae, fish, Freitag et al. 1984)
- 1.54 (algae, wet weight basis after 1 d, Geyer et al. 1984)
- 0.602 (calculated- K_{OW} , Geyer et al. 1984)
- 2.93 (activated sludge, Freitag et al. 1987)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $k = 1 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 12 \text{ min}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982);

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982);

aqueous photooxidation $t_{1/2} = 0.39\text{--}19.3 \text{ h}$ in surface water, based on measured rate data for the reaction with alkyl peroxy radical in aqueous solution (Mill 1982; selected, Howard et al. 1991);

photooxidation $t_{1/2} = 6\text{--}26.1 \text{ h}$ in air, based on estimated rate constant for the vapor-phase reaction with hydroxyl radical in air (Atkinson 1987; selected, Howard et al. 1991);

72.1 mg/L of total organic carbon (TOC) degraded to 98% TOC after 5 h of illumination with a 250 W tungsten lamp by photo-Fenton reaction (Ruppert et al. 1993).

Hydrolysis: no hydrolyzable group (Howard et al. 1991).

Biodegradation: 95% degradation in 1–2 d in mixed bacteria cultures (Tabak et al. 1964);

average rate of biodegradation $54.2 \text{ mg COD g}^{-1}\cdot\text{h}^{-1}$ based on measurements of COD decrease using activated sludge inoculum with 20 d of adaptation to the substrate (Pitter 1976; quoted, Scow 1982);

aqueous aerobic $t_{1/2} = 24\text{--}168 \text{ h}$, based on aqueous screening test data (Ludzack & Ettinger 1960; Belly & Goodhue 1976; Gerike & Fischer 1979; selected, Howard et al. 1991);

aqueous anaerobic $t_{1/2} = 96\text{--}672 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environmental Compartments:

Air: photooxidation $t_{1/2} = 6\text{--}26.1$ h, based on estimated rate constant for the vapor-phase reaction with hydroxyl radical in air (Howard et al. 1991);

atmospheric transformation lifetime was estimated to be 1 to 5 d (Kelly et al. 1994).

Surface water: aqueous photooxidation $t_{1/2} = 0.39\text{--}19.3$ h, based on measured rate data for the reaction with alkylperoxyl radical in aqueous solution (Mill 1982; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 48\text{--}336$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

14.1.4.8 2-Methoxyphenol (Guaiacol)

Common Name: Guaiacol

Synonym: 2-methoxyphenol, methylcatechol, *o*-hydroxyanisole, 1-hydroxy-2-methoxybenzene, pyrocatechol mono-methylether

Chemical Name: *o*-methoxyphenol

CAS Registry No: 90-05-1

Molecular Formula: $C_7H_8O_2$, $C_6H_4(OCH_3)OH$

Molecular Weight: 124.138

Melting Point ($^{\circ}C$):

32 (Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$): 204–206

205 (Lide 2003)

Density (g/cm^3):

1.129 (crystal)

1.112 (liquid, solidified at $28^{\circ}C$)

Acid Dissociation Constant, pK :

Molar Volume (cm^3/mol):

134.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 5 J/mol K$), F : 0.854 (mp at $32^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

143000–16700 (Windholz 1983)

16000 ($15^{\circ}C$, Verschueren 1983)

15000 (room temp., Dean 1985)

18700, 1316 ($15^{\circ}C$, $37^{\circ}C$, Yalkowsky et al. 1987)

24800 ($25^{\circ}C$, shake flask-HPLC/UV, Tam et al. 1994)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($52.4^{\circ}C$, summary of literature data, temp range 52.4 – $205^{\circ}C$, Stull 1947)

1333* ($82.0^{\circ}C$, ebulliometry, measured range 82.0 – $205.0^{\circ}C$, Vonterres et al. 1955)

$\log(P/mmHg) = [-0.2185 \times 13425.8/(T/K)] + 9.027299$; temp range 52.4 – $205^{\circ}C$ (Antoine eq., Weast 1972–73)

$\log(P/mmHg) = [1 - 477.010/(T/K)] \times 10^4 \{0.858892 - 4.47192 \times 10^{-4} \cdot (T/K) + 3.228549 \times 10^{-7} \cdot (T/K)^2\}$; temp range 355.15 – $478.15 K$ (Cox eq., Chao et al. 1983)

13.73 (Verschueren 1983)

8.88 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 5.40415 - 1121.391/(125.407 + t/^{\circ}C)$; temp range 82 – $205^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

6.79 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 6.161 - 1051/(116.0 + t/^{\circ}C)$; temp range 82 – $205^{\circ}C$ (Antoine eq., Dean 1985, 1992)

24.5 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.44572 - 1786.15/(-76.43 + T/K)$; temp range 378 – $479 K$ (Antoine eq., Stephenson & Malanowski 1987)

21.00 (quoted, Sagebiel & Seiber 1993)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

0.30 (calculated- P/C , Sagebiel et al. 1992)

- 0.13, 0.11 (gas stripping-UV, headspace-GC, Sagebiel et al. 1992)
 0.132 (bubble chamber, Sagebiel & Seiber 1993)
 0.049 (calculated-group contribution, Lee et al. 2000)
 0.0724 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 6.198 - 3144/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 1.33 (shake flask-UV, Umeyama et al. 1971)
 1.35 (shake flask-UV, Korenman 1973)
 1.33 (shake flask-UV, Norrington et al. 1975)
 1.58 (Hansch & Leo 1979)
 1.25 (HPLC-RT correlation, Butte et al. 1981)
 1.32 (shake flask, Log P Database, Hansch & Leo 1987)
 1.32 (recommended, LOGKOW databank, Sangster 1993)
 1.32 (recommended, Hansch et al. 1995;)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 1.56 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

FIGURE 14.1.4.11.1 Logarithm of mole fraction solubility (ln x) versus reciprocal temperature for 4-chloroguaiacol.

14.1.4.12 4,5-Dichloroguaiacol

Common Name: 4,5-Dichloroguaiacol

Synonym: 4,5-dichloro-2-methoxyphenol

Chemical Name: 4,5-dichloroguaiacol

CAS Registry No: 2460-49-3

Molecular Formula: $C_7H_6Cl_2O_2$

Molecular Weight: 193.028

Melting Point ($^{\circ}C$): 69–70

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

8.26, 8.52 (20 $^{\circ}C$, regressions, Xie & Dyrssen 1984)

Molar Volume (cm^3/mol):

176.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at 25 $^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at 25 $^{\circ}C$):

584 (shake flask-HPLC/UV, pH 5.6, Tam et al. 1994)

565 (shake flask-GC/ECD, pH 5.6, Tam et al. 1994)

3130, 1086 (supercooled liquid values: calculated-group contribution, calculated- AQUAFAC, Lee et al. 2000)

Vapor Pressure (Pa at 25 $^{\circ}C$):

1.54 (supercooled liquid P_L , correlated-GC-RT, Bidleman & Renberg 1985)

Henry's Law Constant ($Pa\cdot m^3/mol$ at 25 $^{\circ}C$):

0.44 (calculated- P_L/C_L , Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.04 (calculated-fragment const., Rekker 1977)

3.28 (Hansch & Leo 1979)

3.26 (shake flask-UV, Saarikoski & Viluksela 1982)

3.18 (shake flask-GC, Xie et al. 1984)

3.28 (HPLC- k' correlation, Xie et al. 1984)

3.20, 3.19, 3.19 (shake flask-GC, regressions, Xie & Dryssen 1984)

3.26 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

1.74–2.05, 2.03 (rainbow trout: 1–21 d exposure, mean value, Niimi et al. 1990)

1.18–1.51, 1.75 (quoted, estimated, NCASI 1992)

2.03 (*Oncorhynchus mykiss*, quoted, Devillers et al. 1996)

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: 5% reduction in concn (5 -M) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d (Neilson et al. 1991)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

14.1.4.13 3,4,5-Trichloroguaiacol

Common Name: 3,4,5-Trichloroguaiacol

Synonym: 3,4,5-trichloro-2-methoxyphenol

Chemical Name: 3,4,5-trichloroguaiacol

CAS Registry No: 57057-83-7

Molecular Formula: $C_7H_3Cl_3O_2$

Molecular Weight: 227.473

Melting Point ($^{\circ}C$): 85–86

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

7.55 (Könemann 1981)

7.43, 7.52, 7.56 ($20^{\circ}C$, regressions, Xie & Dyrssen 1984)

7.90 (Leuenberger et al. 1985)

7.56 (Xie et al. 1986)

Molar Volume (cm^3/mol):

197.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

305 (shake flask-HPLC/UV, pH 5.9, Tam et al. 1994)

313 (shake flask-GC/ECD, pH 5.9, Tam et al. 1994)

Vapor Pressure (Pa at $25^{\circ}C$):

0.64 (supercooled liquid value, correlated-GC-RT, Bidleman & Renberg 1985)

Henry's Law Constant ($Pa\cdot m^3/mol$ at $25^{\circ}C$):

0.12 (calculated-P/C, Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.77 (shake flask-UV, Saarikoski & Viluksela 1982)

4.11 (shake flask-GC, Xie et al. 1984)

4.18 (HPLC- k' correlation, Xie et al. 1984)

4.14 (shake flask-GC, Xie & Dyrssen 1984)

3.77 (recommended, Sangster 1993)

3.77 (COMPUTOX databank, Kaiser 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

1.60 (rainbow trout, Oikari et al. 1985)

2.06–2.51, 2.41 (rainbow trout: 1–21 d exposure, mean value, Niimi et al. 1990)

1.78–1.95 (field studies, bile of rainbow trout, Niimi et al. 1990)

2.47 (estimated, NCASI 1992)

2.20 (*Oncorhynchus mykiss*, Devillers et al. 1996)

Sorption coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 1\text{--}2$ d in bleak and $t_{1/2} = 2$ d in trout (Niimi et al. 1990).

14.1.4.14 4,5,6-Trichloroguaiacol

Common Name: 4,5,6-Trichloroguaiacol

Synonym: 2,3,4-trichloro-6-methoxyphenol

Chemical Name: 4,5,6-trichloroguaiacol

CAS Registry No: 2668-24-8

Molecular Formula: $C_7H_5Cl_3O_2$

Molecular Weight: 227.473

Melting Point ($^{\circ}C$): 112–115

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

7.07 (Leuenberger et al. 1985)

7.20 ($20^{\circ}C$, regressions, Xie & Dyrssen 1984)

Molar Volume (cm^3/mol):

197.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

57.0 (shake flask-HPLC/UV, pH 5.8, Tam et al. 1994)

50.0 (shake flask-GC/ECD, pH 5.8, Tam et al. 1994)

Vapor Pressure (Pa at $25^{\circ}C$):

0.249 (supercooled liquid value, correlated-GC-RT, Bidleman & Renberg 1985)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

8.82 (calculated-P/C)

0.14 (calculated-P/C, Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.74 (shake flask-GC, Xie et al. 1984)

3.92, 3.91, 3.78 (HPLC- k' correlation, calculated- π const., calculated-f const., Xie et al. 1984)

3.73, 3.74, 3.72 (shake flask-GC, regressions, Xie & Dyrssen 1984)

3.57 (calculated-fragment const., Niimi et al. 1990)

3.72, 3.92 (literature values, Sangster 1993)

3.82 (COMPUTOX databank, Kaiser 1993)

3.72, 3.92 (literature values, Hansch et al. 1995)

3.19 (from Panoma database or calculated from MedChem program, Sabljic et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

2.60 (bleaks, Renberg et al. 1980)

1.90–2.11 (rainbow trout, Oikari et al. 1985)

2.59 (bleaks, Walden et al. 1986)

- 1.88–2.05, 1.97 (rainbow trout: 1–21 d exposure, mean value, Niimi et al. 1990)
 1.78–1.95 (field studies, bile of trout, Niimi et al. 1990)
 4.81 (fourhorn sculpin *myoxocephalus quadricornis*, bile BCF in brackish water, during 6–20 d exposure under continuous water-flow conditions, Wachtmeister et al. 1991)
 2.22 (estimated, NCASI 1992)
 1.97 (*Oncorhynchus mykiss*, Devillers et al. 1996)

Sorption Partition Coefficient, log K_{oc} :

- 3.11 (sediment, $K_p = 1.3 \text{ ml} \cdot (\text{kg of organic C})^{-1}$, batch sorption equilibrium, Remberger et al. 1986, quoted, Neilson et al. 1991)
 2.80, 2.94 (soil, quoted, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
 2.80 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 1.35 (sediment, $K_p = 22 \text{ ml kg of organic C}^{-1}$, batch sorption equilibrium, Remberger et al. 1986; Neilson et al. 1991)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: 16% reduction in concn (5 -M) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)

Biotransformation:

Bioconcentration, Uptake(k_1) and Elimination (k_2) Rate Constants Rates:

Half-Lives in the Environment:

Biota: $t_{1/2} = 1$ to 2 d in bleak (Niimi et al. 1990).

14.1.4.15 3,4,5,6-Tetrachloroguaiacol

Common Name: 3,4,5,6-Tetrachloroguaiacol

Synonym: 2,3,4,5-tetrachloro-6-methoxyphenol

Chemical Name: 3,4,5,6-tetrachloroguaiacol

CAS Registry No: 2539-17-5

Molecular Formula: $C_7H_4Cl_4O_2$

Molecular Weight: 261.918

Melting Point ($^{\circ}C$): 121–122

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

6.26 (Leuenberger et al. 1985)

6.19, 6.12, 6.26 ($20^{\circ}C$, regressions, Xie & Dyrssen 1984)

Molar Volume (cm^3/mol):

218.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

27.0 (shake flask-HPLC/UV, pH 4.2, Tam et al. 1994)

25.0 (shake flask-GC/ECD, pH 4.2, Tam et al. 1994)

165, 28 (supercooled liquid values: calculated-group contribution, calculated-AQAUFAC, Lee et al. 2000)

Vapor Pressure (Pa at $25^{\circ}C$):

0.138 (supercooled liquid value, correlated-GC-RT, Bidleman & Renberg 1985)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

1.013 (Leuenberger et al. 1985; quoted, Barton 1987)

0.15 (calculated-P/C, Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.29 (Saarikoski & Viluksela 1982)

4.45 (shake flask-GC, Xie et al. 1984)

4.76, 5.01, 4.52 (HPLC- k' correlation, calculated- π const., calculated-fragment const., Xie et al. 1984)

4.41, 4.43, 4.42 (shake flask, regressions, Xie & Dyrssen 1984)

4.53 (Leuenberger et al. 1985)

4.28 (calculated-fragment, Niimi et al. 1990)

4.59 (COMPUTOX databank, Kaiser 1993)

4.42, 4.76 (literature values, Sangster 1993)

4.42 (selected, Hansch et al. 1995)

3.83 (from Panoma database or calculated from MedChem program, Sabljic et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

2.60 (bleaks, after 2 weeks exposure, Renberg et al. 1980)

1.60–2.18 (rainbow trout, Oikari et al. 1985)

- 1.78–1.95 (bile of rainbow trout, field studies, Niimi et al. 1990)
2.04–2.38, 2.26 (rainbow trout: 1–21 d exposure, mean value, Niimi et al. 1990)
3.20 (roach, Niimi et al. 1990, quoted, NCASI 1992)
2.84 (estimated, NCASI 1992)
2.26 (*Oncorhynchus mykiss*, Devillers et al. 1996)

Sorption Partition Coefficient, log K_{OC} :

- 2.85 (soil, Seip et al. 1986)
3.15 (sediment, $K_p = 1.5 \text{ ml} \cdot (\text{kg of organic C})^{-1}$, batch sorption equilibrium, Remberger et al. 1986)
2.30 (soil, calculated-MCI χ , Bahnick & Doucette 1988)
2.85, 3.17 (soil, quoted, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
2.85 (soil, calculated-MCI χ , Sabljic et al. 1995)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: 100% reduction in concn (5 -M) after incubation with cells of *Rhodococcus chlorophenolicus* for 14 d under aerobic conditions (Neilson et al. 1991)

Biotransformation:

Bioconcentration, Uptake(k_1) and Elimination (k_2) Rate Constants Rates:

Half-Lives in the Environment:

Biota: $t_{1/2} < 10$ d in trout liver (Niimi et al. 1990); $t_{1/2} = 1\text{--}2$ d in bleak (Niimi et al. 1990).

14.1.4.16 Vanillin (4-Hydroxy-3-methoxybenzaldehyde)

Common Name: Vanillin

Synonym: 4-hydroxy-3-methoxybenzaldehyde, vanillic aldehyde, methylprotocatechuic aldehyde

Chemical Name: 4-hydroxy-3-methoxybenzaldehyde

CAS Registry No: 121-33-5

Molecular Formula: $C_8H_8O_3$, $C_6H_3OHCHO(OCH_3)$

Molecular Weight: 152.148

Melting Point ($^{\circ}C$):

81.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

285 (Weast 1982–83; Lide 2003)

284 (decomposes, Stephenson & Malanowski 1987)

Density (g/cm^3):

1.056 (Weast 1982–83)

Acid Dissociation Constant, pK_a :

7.40 (Sangster 1993)

7.62 (Varhaníčková et al 1995)

Molar Volume (cm^3/mol):

156.9 (Le Bas method-calculated at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.279 (mp at $81.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2480 (at pH 4.50, shake flask-HPLC/UV, Varhaníčková et al 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

133.3 ($107^{\circ}C$, summary of literature data, temp range 107 – $285^{\circ}C$, Stull 1947)

$\log(P_S/kPa) = 10.997 - 4623/(T/K)$; temp range 288 – 333 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_S/kPa) = 10.93562 - 4535.023/(T/K)$; temp range 297 – 328 K (solid, Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.01734 - 3198.18/(-17.047 + T/K)$; temp range 380 – 558 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log(P/mmHg) = -25.583 - 4.086 \times 10^3/(T/K) + 17.515 \cdot \log(T/K) - 2.8177 \times 10^{-2} \cdot (T/K) + 1.0912 \times 10^{-5} \cdot (T/K)^2$; temp range 355 – 777 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.31 (shake flask-UV, Korenman & Sotnikova 1975)

1.21 (shake flask-UV, Holmes & Lough 1976)

1.21 (shake flask-HPLC, Bazaco & Coca 1989)

1.21 (recommended, Sangster 1993)

1.21 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.4.17 5-Chlorovanillin

Common Name: 5-Chlorovanillin

Synonym:

Chemical Name: 5-chlorovanillin

CAS Registry No: 19463-48-0

Molecular Formula: $C_8H_7ClO_3$, $C_6H_2ClCHO(OCH_3)$

Molecular Weight: 185.593

Melting Point ($^{\circ}C$):

165 (Weast 1982–83; Lide 2003)

169 (Varhaníčková et al 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a

6.80 (Varhaníčková et al 1995)

Molar Volume (cm^3/mol):

177.8 (Le Bas method -calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.042 (mp at $165^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

932 (at pH 4.55, shake flask-HPLC/UV, Varhaníčková et al 1995)

249* ($24^{\circ}C$, shake flask-HPLC/UV, measured range 7.5 – $85.9^{\circ}C$, Larachi et al. 2000)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.76 (NCASI 1992)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

0.59 (estimated- K_{ow} , NCASI 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

TABLE 14.1.4.17.1

Reported aqueous solubilities of 5-chlorovanillin at various temperatures

Larachi et al. 2000

shake flask-HPLC/UV

t/°C	S/g·m ⁻³
7.5	171
12.0	171
16.8	184
19.8	168
24.0	249
30.0	286
36.5	505
46.0	629
50.0	760
59.0	932
65.0	1139
70.0	1267
80.0	1767
85.9	2314

$$\Delta S_{\text{fus}}/(\text{kJ mol}^{-1}) = 89.1$$

Half-Lives in the Environment:

14.1.4.20 Syringol (2,6-Dimethoxyphenol)

Common Name: Syringol

Synonym: 2,6-dimethoxyphenol

Chemical Name: 2,6-dimethoxyphenol

CAS Registry No: 91-10-1

Molecular Formula: C₈H₁₀O₃, C₆H₃OH(OCH₃)₂

Molecular Weight: 154.163

Melting Point (°C):

53–56 (Aldrich catalog 1998–1999)

56.5 (Lide 2003)

Boiling Point (°C):

261 (Aldrich catalog 1998–1999; Lide 2003)

Density (g/cm³):

Acid Dissociation Constant, pK_a:

Molar Volume (cm³/mol):

166.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F:

Water Solubility (g/m³ or mg/L at 25°C):

18200 (shake flask-UV spectroscopy, Sagebiel & Seiber 1993)

Vapor Pressure (Pa at 25°C):

0.45 (GC-RT correlation, Sagebiel & Seiber 1993)

Henry's Law Constant (Pa m³/mol at 25°C):

0.00271 (gas stripping-GC, Sagebiel & Seiber 1993)

Octanol/Water Partition Coefficient, log K_{ow}:

1.15 (shake flask-UV, Fujita et al. 1964)

1.15 (recommended, Sangster 1993)

1.15 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{oa}:

Bioconcentration Factor, log BCF or log K_B:

Sorption Partition Coefficient, log K_{oc}:

Environmental Fate Rate Constants, k, and Half-Lives, t_{1/2}:

Half-Lives in the Environment:

14.1.4.21 3-Chlorosyringol

Common Name: 3-Chlorosyringol

Synonym: 3-chloro-2,6-dimethoxyphenol

Chemical Name: 3-chlorosyringol

CAS Registry No: 18113-22-9

Molecular Formula: $C_8H_9ClO_3$, $C_6H_2(OH)Cl(OCH_3)_2$

Molecular Weight: 188.608

Melting Point ($^{\circ}C$):

35-36 (Varhaníčková et al 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

9.09 (Varhaníčková et al 1995)

Molar Volume (cm^3/mol):

186.9 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

68.6 (Lei et al. 1999)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

5170 (at pH 4.30, shake flask-HPLC/UV, Varhaníčková et al 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.825 (supercooled liquid P_L , GC-RT correlation, Lei et al. 1999)

$\log(P_L/Pa) = -3580/(T/K) - 11.93$ (GC-RT correlation, Lei et al. 2001)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

0.011 (calculated- P_L/C_L , Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.4.22 3,5-Dichlorosyringol

Common Name: 3,5-Dichlorosyringol

Synonym: 3,5-dichloro-2,6-dimethoxyphenol

Chemical Name: 3,5-dichlorosyringol

CAS Registry No: 78782-46-4

Molecular Formula: $C_8H_8Cl_2O_2$, $C_6H(OH)Cl_2(OCH_3)_2$

Molecular Weight: 223.054

Melting Point ($^{\circ}C$):

105–106 (Varhaníčková et al 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constants, pK_a :

7.27 (Varhaníčková et al 1995)

Molar Volume (cm^3/mol):

207.8 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

70.4 (Lei et al. 1999)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

244 (at pH 5.80, shake flask-HPLC/UV, Varhaníčková et al 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.465 (supercooled liquid P_L , GC-RT correlation, Lei et al. 1999)

$\log(P_L/Pa) = -3679/(T/K) - 12.01$, (GC-RT correlation, Lei et al. 1999)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

0.069 (calculated- P_L/C_L , Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.4.23 Trichlorosyringol

Common Name: Trichlorosyringol

Synonym: 3,4,5-trichloro-2,6-dimethoxyphenol

Chemical Name: 3,4,5-trichloro-2,6-dimethoxyphenol

CAS Registry No: 2539-26-6

Molecular Formula: $C_8H_7Cl_3O_3$, $C_6(OH)Cl_3(OCH_3)_2$

Molecular Weight: 257.499

Melting Point ($^{\circ}C$):

122–123 (Varhanířková et al 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

7.73 (Varhanířková et al 1995)

Molar Volume (cm^3/mol):

228.7 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

77.4 (Lei et al. 1999)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

100 (at pH 3.90, shake flask-HPLC/UV, Varhanířková et al 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.077 (supercooled liquid P_L , GC-RT correlation; Lei et al. 1999)

$\log(P_L/Pa) = -4014/(T/K) - 12.44$, (GC-RT correlation, Lei et al. 1999)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

0.022 (calculated- P_L/C_L , Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.74 (shake flask-GC, Saarikoski & Viluksela 1982)

4.20 (quoted, NCASI 1992)

3.74 (recommended, Sangster 1993)

3.74 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

1.19 (estimated- K_{ow} , NCASI 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.4.24 2-Chlorosyringaldehyde

Common Name: 2-Chlorosyringaldehyde

Synonym:

Chemical Name: 2-chlorosyringaldehyde

CAS Registry No: 76341-69-0

Molecular Formula: $C_9H_9ClO_4$, $C_6H(OH)Cl(CHO)(OCH_3)_2$

Molecular Weight: 216.619

Melting Point ($^{\circ}C$):

196–197 (Varhaníčková et al 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

6.80 (Varhaníčková et al 1995)

Molar Volume (cm^3/mol):

209.1 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

77.7 (Lei et al. 1999)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

33 (at pH 5.30, shake flask-HPLC/UV, Varhaníčková et al 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.079 (supercooled liquid P_L , GC-RT correlation; Lei et al. 1999)

$\log(P_L/Pa) = -4058/(T/K) - 12.51$, (GC-RT correlation, Lei et al. 1999)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

0.069 (calculated- P_L/C_L , Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.81 (quoted, NCASI 1992)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

0.62 (estimated- K_{ow} , NCASI 1992)

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

14.1.4.25 2,6-Dichlorosyringaldehyde

Common Name: 2,6-Dichlorosyringaldehyde

Synonym:

Chemical Name:

CAS Registry No: 76330-06-8

Molecular Formula: $C_9H_8Cl_2O_4$, $C_6(OH)Cl_2(CHO)(OCH_3)_2$

Molecular Weight: 251.064

Melting Point ($^{\circ}C$):

195.6 (Varhaníčková et al 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Acid Dissociation Constant, pK_a :

Molar Volume (cm^3/mol):

230.0 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

82.2 (Lei et al. 1999)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

26.0 (at pH 4.60, shake flask-HPLC/UV, Varhaníčková et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$):

0.025 (supercooled liquid P_L , GC-RT correlation; Lei et al. 1999)

$\log(P_L/Pa) = -4293/(T/K) - 12.79$, (GC-RT correlation, Lei et al. 1999)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

0.0037 (calculated- P_L/C_L , Lei et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.52 (quoted, NCASI 1992)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

1.19 (estimated- K_{ow} , NCASI 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

TABLE 14.2.3

Suggested half-life classes for phenolic compounds in various environmental compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Alkylphenols and other substituted phenols:				
Phenol	2	3	4	5
<i>o</i> -Cresol	1	2	3	4
<i>p</i> -Cresol	1	2	3	4
2,4-Dimethylphenol	2	3	4	5
Chlorophenols:				
2,4-Dichlorophenol	3	3	5	6
2,4,5-Trichlorophenol	4	4	6	7
2,4,6-Trichlorophenol	4	4	6	7
2,3,4,6-Tetrachlorophenol	5	5	6	7
Pentachlorophenol	5	5	6	7
Nitrophenols:				
2-Nitrophenol	3	3	5	6
4-Nitrophenol	3	3	5	6
2,4-Dinitrophenol	4	4	6	7
2,4,6-Trinitrophenol				
4,6-Dinitro- <i>o</i> -cresol	4	4	6	7
Dihydroxybenzenes, methoxyphenols and chloroguaiacols:				
Catechol	2	3	4	5
2-Methoxyphenol (Guaiacol)	2	3	4	5
Tetrachloroguaiacol	4	4	6	7

where,

Class	Mean half-life (hours)	Range (hours)
1	5	< 10
2	17 (~ 1 day)	10–30
3	55 (~ 2 days)	30–100
4	170 (~ 1 week)	100–300
5	550 (~ 3 weeks)	300–1,000
6	1700 (~ 2 months)	1,000–3,000
7	5500 (~ 8 months)	3,000–10,000
8	17000 (~ 2 years)	10,000–30,000
9	~ 5 years	> 30,000

15.1 LIST OF CHEMICALS AND DATA COMPILATIONS

15.1.1 ALIPHATIC ESTERS

15.1.1.1 Methyl formate

Common Name: Methyl formate

Synonym: formic acid methyl ester, methyl methanoate

Chemical Name: methyl formate

CAS Registry No: 107-31-3

Molecular Formula: $C_2H_4O_2$, $HCOOCH_3$

Molecular Weight: 60.052

Melting Point ($^{\circ}C$):

-99.0 (Weast 1982–83; Dean 1985; Lide 2003)

Boiling Point ($^{\circ}C$):

31.7 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9742 (Weast 1982–83)

0.9742, 0.9664 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

62.8 (exptl. at normal bp, Lee et al. 1972)

61.6 ($20^{\circ}C$, calculated-density)

62.6 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

30.59; 29.72 ($25^{\circ}C$; bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

7.75 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

230000 (USEPA 1975; quoted, Howard 1993)

304000 ($20^{\circ}C$, Verschueren 1983)

230000 (Dean 1985; Riddick et al. 1986)

23800 (solubility data compilation, Yaws et al. 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

83260* (isoteniscope method, measured range 21 – $31.7^{\circ}C$, Nelson 1928)

$\log(P/mmHg) = 7.2202 - 1320.8/(T/K)$; temp range 21 – $31.7^{\circ}C$, Nelson 1928)

53329* ($16^{\circ}C$, summary of literature data, temp range -74.2 to $213^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 7027.8/(T/K)] + 7.852144$; temp range -74.2 to $213^{\circ}C$ (Antoine eq., Weast 1972–73)

63980, 93310 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1983)

80840 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 2.11093 - 1.573/(-17.263 + t/^{\circ}C)$, temp range: 21 – $31.7^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

83440 (calculated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 3.207 - 3.02/(-11.9 + t/^{\circ}C)$, temp range: 21 – $32^{\circ}C$ (Antoine eq., Dean 1985, 1992)

78060 (selected lit., Riddick et al. 1986)

$\log(P/kPa) = 6.29529 - 1125.2/(174.2 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

78600 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.225693 - 1088.955/(-46.675 + T/\text{K})$; temp range 279–305 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.39684 - 1196.323/(-32.629 + T/\text{K})$; temp range 305–443 K (Antoine eq.-II, Stephenson & Malanowski 1987)

78070 (Daubert & Danner 1989)

$\log (P/\text{mmHg}) = 28.9576 - 2.3582 \times 10^3/(T/\text{K}) - 7.4848 \cdot \log(T/\text{K}) + 7.4384 \times 10^{-10} \cdot (T/\text{K}) + 2.7013 \times 10^{-6} \cdot (T/\text{K})^2$, temp range 174–487 K (vapor pressure eq., Yaws 1994)

114881 (35°C, vapor-liquid equilibrium VLE data, Alderson et al. 2003)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

22.61 (exptl., Hine & Mookerjee 1975)

20.15, 17.96 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

15.64 (calculated-MCI χ , Nirmalakhandan & Speece 1988)

26.02 (calculated-P/C, Hoff et al. 1993)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

−0.010 (calculated-intrinsic molar volume V_1 and solvatochromic parameters, Leahy 1986)

−0.264 (estimated, Howard 1993)

0.03 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

1.75 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

−0.222 (estimated-S, Lyman et al. 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

0.699 (soil, estimated-S, Lyman et al. 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: based on Henry's law constant, $t_{1/2} \sim 5.3$ h from a model river of one meter deep flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1990; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or Arrhenius equation see reference:

$k_{OH} = (2.27 \pm 0.34) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240–440 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a, quoted, Atkinson 1989)

$k_{OH}(\text{calc}) = 0.43 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: aqueous base-catalyzed hydrolysis $k = 36.6 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C corresponds to $t_{1/2} = 21.9$ d, 2.19 d, 9.1 h and 0.91 h at respective pHs of 6, 7, 8, and 9 (Mabey & Mill 1978; quoted, Howard 1993)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: estimated $t_{1/2} = 74$ d, based on experimental reaction rate constant for the vapor-phase reaction with photochemically produced hydroxyl radical in the atmosphere at 23°C (Atkinson 1989; quoted, Howard 1993).

TABLE 15.1.1.1.1

15.1.1.2 Ethyl formate

Common Name: Ethyl formate

Synonym: ethyl methanoate, formic acid ethyl ester

Chemical Name: ethyl formate

CAS Registry No: 109-94-4

Molecular Formula: $C_3H_6O_2$, $HCOOCH_2CH_3$

Molecular Weight: 74.079

Melting Point ($^{\circ}C$):

-79.6 (Lide 2003)

Boiling Point ($^{\circ}C$):

54.4 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9168 (Weast 1982-83)

0.9220, 0.9153 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

80.8 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

86.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

31.64; 29.94 ($25^{\circ}C$; bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

9.205 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

88250 (Seidell 1941)

93260 (estimated, McGowan 1954)

52440 (Deno & Berkheimer 1960)

118000 (Verschueren 1983; Riddick et al. 1986)

117000 (Dean 1985)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

34530* ($25.4^{\circ}C$, isoteniscope method, measured range 25.4 – $55.4^{\circ}C$, Nelson 1928)

$\log(P/mmHg) = 7.8457 - 1621.2/(T/K)$; temp range 25.4 – $55.4^{\circ}C$ (Nelson 1928)

33050* (interpolated-regression of tabulated data, temp range -60.5 to $54.3^{\circ}C$, Stull 1947)

30844* ($23.715^{\circ}C$, temp range 3.893 – $53.56^{\circ}C$, Mertl & Polak 1964 - ref. see Boublik et al. 1984)

$\log(P/mmHg) = [-0.2185 \times 7511.7/(T/K)] + 7.842747$; temp range -60.5 to $225^{\circ}C$ (Antoine eq., Weast 1972-73)

25590, 39990 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1983)

30840, 32610 ($23.7^{\circ}C$, quoted exptl., interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.13263 - 1123.305/(218.177 + t/^{\circ}C)$; temp range 3.89 – $53.56^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

32540 (interpolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 7.0090 - 1123.94/(218.2 + t/^{\circ}C)$; temp range 4 – $54^{\circ}C$ (Antoine eq., Dean 1985, 1992)

32370 (selected, Riddick et al. 1986)

33070 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.1384 - 1151.08/[-48.94 + (T/K)]$; temp range: 213 – $336 K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.4206 - 1326.4/[-26.867 + (T/K)]$; temp range: 327 – $498 K$ (Antoine eq.-II, Stephenson & Malanowski 1987)

$$\log (P/\text{mmHg}) = 29.9404 - 2.5263 \times 10^3/(T/K) - 7.809 \cdot \log(T/K) - 1.0111 \times 10^{-9} \cdot (T/K) + 2.7447 \times 10^{-6} \cdot (T/K)^2;$$

temp range 194–508 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

28.46	(exptl., Hine & Mookerjee 1975)
27.18, 25.96	(calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

15.1.1.3 Propyl formate

Common Name: Propyl formate

Synonym: formic acid propyl ester, methanoic acid *n*-propyl ester, propyl methanoate

Chemical Name: *n*-propyl formate, propyl formate

CAS Registry No: 110-74-7

Molecular Formula: C₄H₈O₂, HCOOCH₂CH₂CH₃

Molecular Weight: 88.10 6

Melting Point (°C):

−92.9 (Stull 1947; Weast 1982–83; Dean 1985; Riddick et al. 1986; Lide 2003)

Boiling Point (°C):

80.9 (Lide 2003)

Density (g/cm³ at 20°C):

0.9058 (Weast 1982–83)

0.9006 (Dean 1985)

0.9055, 0.8996 (20°C, 25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

97.3 (20°C, calculated-density)

110.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a:

Enthalpy of Vaporization, ΔH_v (kJ/mol):

37.49; 33.60 (25°C; bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

28445 (Seidell 1941)

27230 (Deno & Berkheimer 1960)

27300 (Hansch et al. 1968; quoted, Hine & Mookerjee 1975; Müller & Klein 1992)

20500 (Dean 1985; Riddick et al. 1986)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

11759* (26.2°C, isotenoscope method, measured range 26.2–82.3°C, Nelson 1928)

log (P/mmHg) = 7.9925 – 1806.5/(T/K); temp range 26.2–82.3°C (Nelson 1928)

10620* (interpolated-regression of tabulated data, temp range −43 to 81.3°C Stull 1947)

log (P/mmHg) = [−0.2185 × 8208.1/(T/K)] + 7.891833; temp range −43 to 245°C (Antoine eq., Weast 1972–73)

11010 (calculated-Antoine eq., Boublik et al. 1984)

log (P/kPa) = 5.98912 – 1135.489/(204.518 + t/°C); temp range: 26.2–82.3°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

10710 (extrapolated-Antoine eq., Dean 1985)

log (P/mmHg) = 6.848 – 1127/(203 + t/°C); temp range: 26–82°C (Antoine eq., Dean 1985, 1992)

11030 (quoted lit. average, Riddick et al. 1986)

log (P/kPa) = 5.97008 – 1132.3/(204.8 + t/°C), temp range not specified (Antoine eq., Riddick et al. 1986)

10810 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

log (P_L/kPa) = 6.73268 – 1560.69/(−24.287 + T/K); temp range: 230–335 K (Antoine eq.-I, Stephenson & Malanowski 1987)

log (P_L/kPa) = 6.2378 – 1301.3/(−46.767 + T/K); temp range: 354–518 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$$\log(P/\text{mmHg}) = 28.6983 - 2.6926 \times 10^3/(T/K) - 7.2435 \cdot \log(T/K) - 8.7226 \times 10^{-11} \cdot (T/K) + 1.9456 \times 10^{-6} \cdot (T/K)^2;$$

temp range 180–538 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

- 37.52 (exptl., Hine & Mookerjee 1975)
 38.39, 38.39 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 22.61 (calculated-MCI χ , Nirmalakhandan & Speece 1988)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 0.73 (calculated, Hansch et al. 1968)
 0.83 (shake flask, unpublished result, Leo et al. 1971; Hansch & Leo 1979)
 0.83 (recommended, Sangster 1989; 1993)
 0.83 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

- 2.66 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} = (2.38 \pm 2.7) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (flash photolysis-resonance fluorescence, Wallington et al. 1988; quoted, Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 1.87 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

15.1.1.4 Methyl acetate

Common Name: Methyl acetate

Synonym: acetic acid methyl ester, ethanoic acid methyl ester, methyl ethanoate

Chemical Name: methyl acetate

CAS Registry No: 79-20-9

Molecular Formula: $C_3H_6O_2$, CH_3COOCH_3

Molecular Weight: 74.079

Melting Point ($^{\circ}C$):

−98.25 (Lide 2003)

Boiling Point ($^{\circ}C$):

56.89 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9330 (Weast 1982–83)

0.9342 (Dean 1985)

0.9342, 0.9279 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

79.3 ($20^{\circ}C$, calculated-density)

84.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

22.50 (pK_s , Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

32.30, 30.33 ($25^{\circ}C$; bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

243730 ($20^{\circ}C$, shake flask-turbidity, Fühner 1924)

294920 (estimated, McGowan 1954)

243500 ($20^{\circ}C$, Stephen & Stephen 1963)

240000, 319000 ($20^{\circ}C$, Verschueren 1983)

240000 (Dean 1985)

245000 ($20^{\circ}C$, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

27980* (interpolated-regression of tabulated data, -52 to $57.8^{\circ}C$, Stull 1947)

25242* ($22.060^{\circ}C$, temp range 1.758 – $55.840^{\circ}C$, Mertl & Polak 1964; quoted, Boublik et al. 1984)

$\log(P/mmHg) = [-0.2185 \times 7732.8/(T/K)] + 7.938782$; temp range -57.2 to $225^{\circ}C$ (Antoine eq., Weast 1972–73)

28830* (ebulliometry, fitted to Antoine eq., Ambrose et al. 1981)

$\log(P/kPa) = 6.24410 - 1183.700/(T/K) - 50.736$; temp range 259.6 – $351.3 K$ (Antoine eq., ebulliometry, Ambrose et al. 1981)

31330 (Verschueren 1983)

28830 (interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.25449 - 1189.608/(223.115 + t/^{\circ}C)$; temp range -13.58 to $78.12^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 6.19357 - 1159.358/(219.913 + t/^{\circ}C)$; temp range 1.76 – $55.84^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

28200 (calculated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 7.0652 - 1157.63/(219.73 + t/^{\circ}C)$; temp range: 1 – $56^{\circ}C$ (Antoine eq., Dean 1985, 1992)

28828 (lit. average, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.24410 - 1183.70/(222.414 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 28830, 28840 (interpolated-Antoine eq. I and II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.190152 - 1157.622/(-53.426 + T/\text{K})$; temp range 274–331 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.18771 - 1156.219/(-53.589 + T/\text{K})$; temp range: 274–331 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 33.7235 - 2.7204 \times 10^3/(T/\text{K}) - 9.1182 \cdot \log(T/\text{K}) - 9.4316 \times 10^{-11} \cdot (T/\text{K}) + 3.3102 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 175–507 K (vapor pressure eq., Yaws 1994)
 53808 (40°C, vapor-liquid equilibrium VLE data, Alderson et al. 2003)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

9.190 (volatility-partial pressure, Butler & Ramchandani 1935)
 11.65 (volatility-partial pressure-GC, Buttery et al. 1969)
 8.795 (exptl., Hine & Mookerjee 1975)
 11.59, 9.210 (calculated-group contribution, bond contribution, Hine & Mookerjee 1975)
 13.06 (vapor-liquid equilibrium, headspace-GC, measured range 25–40°C data presented in graph, $\Delta H = 39.2 \text{ kJ/mol}$, Kieckbusch & King 1979)
 9.210, 25.96 (quoted, calculated-MCI χ , Nirmalakhandan & Speece 1988)
 9.80 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 4.590 - 2048/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.18 (shake flask-CR, Collander 1951; quoted, Hansch & Leo 1979; Hansch & Leo 1985)
 0.23 (calculated, Hansch et al. 1968)
 0.70 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 0.18 (recommended, Sangster 1989, 1993)
 0.18 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

2.31 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

-0.224 (calculated-S, Lyman et al. 1982)
 -0.092 (calculated- K_{OW} , Lyman et al. 1982)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

0.681 (soil, calculated-S, Lyman et al. 1982; quoted, Howard 1993)
 1.474 (soil, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: based on calculated Henry's law constant, $t_{1/2} \sim 9.1 \text{ h}$ from a model river of 1 m deep flowing at 1 m/s with wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation half-life of 2.4–24 h for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{\text{OH}} = (1.1 \pm 0.03) \times 10^{10} \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ or $(1.7 \pm 0.5) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 292 K using relative rate technique for *n*-butane (Campbell & Parkinson 1978)

$k_{\text{OH}}(\text{exptl}) = (1.3 - 3.41) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with photochemically produced hydroxyl radical in air (Atkinson et al. 1979; Güesten et al. 1984; Atkinson 1987; Wallington et al. 1988a,b; quoted, Howard 1993)

$k_{\text{OH}}(\text{calc}) = 1.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.7 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{\text{OH}}(\text{calc}) = 2.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.7 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}} = (3.41 \pm 0.29) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (absolute rate, flash photolysis-resonance fluorescence, Wallington 1988a)

$k_{\text{OH}} = 3.41 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 2.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{\text{OH}}(\text{calc}) = 6.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: alkaline hydrolysis rate constant $k = 0.182 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C in water (Salmi & Leimu 1947; quoted, Drossman et al. 1988).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 2.4\text{--}24 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

atmospheric $t_{1/2} = 47\text{--}94 \text{ d}$, based on exptl. rate constants for the vapor-phase reaction with photochemically produced hydroxyl radical in air (Atkinson et al. 1979; Güsten et al. 1984; Atkinson 1987; Wallington et al. 1988; quoted, Howard 1993).

15.1.1.5 Vinyl acetate

Common Name: Vinyl acetate

Synonym: ethanoic acid ester, ethenyl acetate, ethenyl ethanoate

Chemical Name: ethenyl acetate, vinyl acetate

CAS Registry No: 108-05-4

Molecular Formula: $C_4H_6O_2$, $CH_3COOCH=CH_2$

Molecular Weight: 86.090

Melting Point ($^{\circ}C$):

−93.2 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

72.8 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9317 (Weast 1982–83)

Molar Volume (cm^3/mol):

92.2 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

101.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

37.2, 34.35 ($25^{\circ}C$, bp. Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

19722 (Deno & Berkheimer 1960)

25000 (Verschuereen 1983)

20000 (Dean 1985)

20000 ($20^{\circ}C$, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

14454* (interpolated-regression of tabulated data, temp range -48 to $72.5^{\circ}C$, Stull 1947)

21.83* ($21.83^{\circ}C$, measured range 21.8 – $72.04^{\circ}C$, Capkova & Fried 1964 - ref see Boublik et al. 1984)

84406* ($67^{\circ}C$, vapor-liquid equilibrium data, measured range 67 – $82^{\circ}C$, Swamy & Van Winkle 1965)

15300 (interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 7.17023 - 1766.918/(269.951 + t/^{\circ}C)$; temp range: 67 – $82^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 6.3363 - 1296.847/(226.731 + t/^{\circ}C)$; temp range: 21.83 – $72.04^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

15300 (interpolated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 7.2101 - 1296.13/(226.66 + t/^{\circ}C)$; temp range: 22 – $72^{\circ}C$ (Antoine eq., Dean 1985, 1992)

14100 (quoted lit. average, Riddick et al. 1986)

$\log(P/kPa) = 7.216 - 1798.4/(T/K)$; temp range: not specified (Antoine eq., Riddick et al. 1986)

15340, 15305 (interpolated-Antoine eq.-I, II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.3799 - 1320.2716/(-43.96 + T/K)$; temp range: 293 – 346 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.34264 - 1300.315/(-46.041 + T/K)$; temp range 294 – 346 K (Antoine eq.-II, Stephenson & Malanowski 1987)

11320 ($20^{\circ}C$, quoted, Howard 1989)

$$\log (P/\text{mmHg}) = 12.722 - 2.177 \times 10^3/(T/K) - 91.458 \cdot \log (T/K) - 4.5688 \times 10^{-3} \cdot (T/K) + 2.9673 \times 10^{-6} \cdot (T/K)^2;$$

temp range 180–524 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

48.74 (calculated-P/C, Howard 1989)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.60 (shake flask, Fujisawa & Masuhara 1980)
0.21 (calculated-HPLC-RT, Fujisawa & Masuhara 1981)
0.73 (recommended, Sangster 1989, 1993)
0.73 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

0.32–0.37 (estimated- K_{OW} , Howard 1989)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

1.28–1.77 (estimated- K_{OW} , Howard 1989)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} = 4.4$ h from a model river of 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s, and $t_{1/2} = 2.2$ d from an environmental pond (Howard 1989).

Photolysis:

Oxidation: $t_{1/2} = 13$ and 8 d for reactions with OH radical and singlet oxygen in sunlit natural water (Howard 1989).

Hydrolysis: overall rate constant $k_h = 1.10 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 7.3$ d at 25°C and pH 7 (Mabey & Mill 1978)
degradation $t_{1/2} = 7.3$ d at 25°C and pH 7, the hydrolysis rate will increase as the pH increases (Howard 1989).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: estimated $t_{1/2} = 12$ h with photochemically produced hydroxyl radical in an average atmosphere (Howard 1989).

Surface water: hydrolysis degradation $t_{1/2} = 7.3$ days at 25°C and pH 7; $t_{1/2} = 13$ and 8 d for reactions with hydroxyl radical and singlet oxygen, respectively, in natural water (Howard 1989).

15.1.1.6 Ethyl acetate

Common Name: Ethyl acetate

Synonym: acetic acid ethyl ester, acetic ether, ethanoic acid ester, ethyl ethanoate

Chemical Name: *n*-ethyl acetate, ethyl acetate

CAS Registry No: 141-78-6

Molecular Formula: $C_4H_8O_2$, $CH_3COOCH_2CH_3$

Molecular Weight: 88.106

Melting Point ($^{\circ}C$):

−83.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

77.11 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9003 (Weast 1982–83)

0.9006, 0.8946 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

106.0 (exptl. at normal bp, Lee et al. 1972)

97.8 ($20^{\circ}C$, calculated-density)

108.6 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

22.83 (pK_s , Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

35.62, 31.97 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.50 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

64408 ($20^{\circ}C$, shake flask-turbidity, Fühner 1924)

85300 ($20^{\circ}C$, synthetic method, Jones 1929)

78720 (shake flask-centrifuge, Booth & Everson 1948)

80100* (turbidimetric method, measured range 20 – $40^{\circ}C$, Altshuller & Everson 1953)

80400* (average, Altshuller & Everson 1953)

79780 (shake flask-interferometry, Donahue & Bartell 1952)

69990 (estimated, McGowan 1954)

82220 (Deno & Berkheimer 1960)

80350 (shake flask-UV, Hansch et al. 1968)

63960 (generator column-GC, Wasik et al. 1981, 1982; Tewari et al. 1982)

82500, 74000 ($20^{\circ}C$, $35^{\circ}C$, literature average, Verschuereen 1983)

80000 (shake flask-HPLC, Banerjee 1984)

97000 (Dean 1985)

95000 (shake flask-radiometric method, Lo et al. 1986)

80800 (lit. average, Riddick et al. 1986)

77900* ($20.2^{\circ}C$, shake flask-GC/TC, measured range 0 – $70^{\circ}C$, Stephenson & Stuart 1986)

73700 (solubility data compilation, Yaws et al. 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

13330*, 11860 ($27.0^{\circ}C$, interpolated-regression of tabulated data, temp range -43.4 to $78.1^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.30588 - 1357.7/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

- 13155* (25.86°C, temp range 15.58–75.830°C, Mertl & Polak 1964; quoted, Boublik et al. 1984)
 $\log(P/\text{mmHg}) = [-0.2185 \times 8301.1/(T/K)] + 8.001170$; temp range –43.4 to 235°C (Antoine eq., Weast 1972–73)
- 12600* (ebulliometry, fitted to Antoine eq., Ambrose et al. 1981)
 $\log(P/\text{kPa}) = 6.18799 - 1224.673/(T/K) - 57.438$; temp range: 271–372.865 K (Antoine eq., ebulliometry, Ambrose et al. 1981)
- 9704 (20°C, Verschueren 1983)
- 11220 (calculated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.1171 - 1245.172/(217.984 + t/^\circ\text{C})$, temp range 15.58–75.83°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.20229 - 1232.542/(216.587 + t/^\circ\text{C})$, temp range –2.08 to 99.71°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
- 12620 (calculated-Antoine eq., Dean 1985)
 $\log(P/\text{mmHg}) = 7.10179 - 1244.95/(217.88 + t/^\circ\text{C})$ temp range 15–76°C (Antoine eq., Dean 1985, 1992)
- 12600 (lit. average, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.18799 - 1224.673/(215.712 + t/^\circ\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
- 12620 (interpolated-Antoine eq.-I and III, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.227229 - 1245.239/(-55.239 + T/K)$; temp range: 288–351 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.38462 - 1369.41/(-37.675 + T/K)$; temp range: 350–508 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.22825 - 1245.68/(-55.193 + T/K)$; temp range: 288–351 K (Antoine eq.-III, Stephenson & Malanowski 1987)
- 3240, 5240 (measured, calculated-solvatochromic parameters, Banerjee et al. 1990)
 $\log(P/\text{mmHg}) = 0.6955 - 2.2498 \times 10^3/(T/K) + 5.4643 \cdot \log(T/K) - 1.9451 \times 10^{-2} \cdot (T/K) + 1.2362 \times 10^{-5} \cdot (T/K)^2$;
temp range 190–623 K (vapor pressure eq., Yaws 1994)
- 25078 (40°C, vapor-liquid equilibrium VLE data, Alderson et al. 2003)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 13.42 (partial pressure, Butler & Ramchandani 1935)
- 17.78 (28°C, concn. ratio-GC, Nelson & Hoff 1968)
- 13.62 (exptl., Hine & Mookerjee 1975)
- 15.64, 13.94 (calculated-group contribution, bond contribution, Hine & Mookerjee 1975)
- 17.20 (vapor-liquid equilibrium, headspace-GC, measured range 25–40°C data presented in graph, $\Delta H = 41.4 \text{ kJ/mol}$, Kieckbusch & King 1979)
- 13.62, 24.22 (quoted, calculated-MCI χ , Nirmalakhandan & Speece 1988)
- 41.72* (40°C, equilibrium headspace-GC, measured range 40–80°C, Kolb et al. 1992)
 $\ln(1/K_{\text{AW}}) = -7.28 + 3563/(T/K)$, temp range 40–80°C (equilibrium headspace-GC, Kolb et al. 1992)
- 13.62, 6.23 (quoted, calculated-molecular structure, Russell et al. 1992)
- 11.33 (calculated, Hoff et al. 1993)
- 13.51 (solid-phase microextraction SPME-GC, Bartelt 1997)
- 12.72 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 5.095 - 2163/(T/K)$, (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 0.66 (shake flask-chemical reaction CR, Collander 1951)
- 0.73 (shake flask-GC, Hansch & Anderson 1967; quoted, Leo et al. 1969, 1971; Hansch & Leo 1979)
- 0.73 (shake flask-UV, Hansch et al. 1968; Hansch & Leo 1979)
- 0.65, 0.66 (calculated- π substituent const.; calculated-fragment const., Rekker 1977)
- 0.70 (exptl., Valvani et al. 1981; quoted, Amidon & Williams 1982)
- 0.53 (calculated-activity coeff. γ , Wasik et al. 1981)
- 0.68 (generator column-GC, Wasik et al. 1981, 1982; Tewari et al. 1982)
- 1.02 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
- 0.73 (recommended, Sangster 1989, 1993)
- 0.73 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

2.70 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

4.13 (alga *Chlorella fusca*, wet wt. basis, Geyer et al. 1984)
 0.70 (alga *Chlorella fusca*, calculated- K_{OW} , Geyer et al. 1984)
 1.48 (golden ide, Freitag et al. 1985)
 4.13 (algae, Freitag et al. 1985)
 3.52 (activated sludge, Freitag et al. 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

0.361 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} \sim 10.1$ h was estimated for a model river of 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1990).

Photolysis: rate constant $k = 6.8 \times 10^{-4} \text{ h}^{-1}$ to $2.21 \times 10^{-3} \text{ h}^{-1}$ with H_2O_2 under photolysis at 25°C in F-113 solution and with HO^- in the gas (Dilling et al. 1988).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or Arrhenius equation see reference:

photooxidation $t_{1/2} = 2.75\text{--}110$ yr in water, based on measured rate constant for the reaction with hydroxyl radical in water (Dorfman & Adams 1973; selected, Howard et al. 1991)

photooxidation $t_{1/2} = 2.4\text{--}24$ h for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{OH} = (1.16 \pm 0.13) \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 292 K using relative rate technique for *n*-butane (Campbell & Parkinson 1978)

$k_{OH}(\text{calc}) = 1.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 1.82 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH}(\text{calc}) = 1.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 1.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (15.1 \pm 1.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 296–440 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a; quoted Atkinson 1989)

$k_{OH} = 1.51 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 6.6 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{OH} = 1.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH}(\text{calc}) = 1.94 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: alkaline hydrolysis rate constant $k = 0.110 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C in water (Salmi & Leimu 1947; quoted, Drossman et al. 1988);

overall rate constant $k_h = 1.10 \times 10^{-8} \text{ s}^{-1}$ with $t_{1/2} = 2.0$ yr at 25°C and pH 7 (Mabey & Mill 1978)

$t_{1/2} = 2.02$ yr, based on measured rate constants for acid and base catalyzed and neutral hydrolysis at pH 7 and 20°C (Mabey & Mill 1978; quoted, Howard 1990; Howard et al. 1991; Kollig 1993)

$t_{1/2} = 9.5 \times 10^7$ d at pH 2, $t_{1/2} = 740$ d at pH 7 and $t_{1/2} = 97000$ d at pH 12 in natural waters at $20\text{--}25^\circ\text{C}$ (Capel & Larson 1995)

Biodegradation: aqueous aerobic $t_{1/2} = 24\text{--}168$ h, based on unacclimated aqueous aerobic biodegradation screening test data (Heukelekian & Rand 1955; Price et al. 1974; selected, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 96\text{--}672$ h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 1$ d, $t_{1/2}(\text{anaerobic}) = 4$ d in natural waters (Capel & Larson 1995)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 2.75\text{--}110$ yr, based on measured rate constant for the reaction with OH radical in water (Dorfman & Adams 1973; selected, Howard et al. 1991);

$t_{1/2} = 2.4\text{--}24$ h for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976);

photodecomposition $t_{1/2} = 14.6$ h under simulated atmospheric conditions, with NO (Dilling et al. 1976)

photooxidation $t_{1/2} = 35.3\text{--}353$ h, based on measured rate constant for the reaction with OH radical in air (Atkinson 1985; selected, Howard et al. 1991);

calculated lifetimes of 6.9 d and 10 yr for reactions with OH radical, NO_3 radical, respectively (Atkinson 2000).

Surface water: $t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biodegradation $t_{1/2}(\text{aerobic}) = 1$ d, $t_{1/2}(\text{anaerobic}) = 4$ d; hydrolysis $t_{1/2} = 9.5 \times 10^7$ d at pH 2, $t_{1/2} = 740$ d at pH 7 and $t_{1/2} = 97000$ d at pH 12 in natural waters at $20\text{--}25^\circ\text{C}$ (Capel & Larson 1995)

Groundwater: $t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

15.1.1.7 Propyl acetate

Common Name: Propyl acetate

Synonym: acetic acid propyl ester, propyl ethanoate, *n*-propyl acetate

Chemical Name: propyl acetate, *n*-propyl acetate

CAS Registry No: 109-60-4

Molecular Formula: $C_5H_{10}O_2$, $CH_3COOCH_2CH_2CH_3$

Molecular Weight: 102.132

Melting Point ($^{\circ}C$):

−93 (Lide 2003)

Boiling Point ($^{\circ}C$):

101.54 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8878 (Weast 1982–83)

0.8830 ($25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

115.0 ($20^{\circ}C$, calculated-density)

133.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

−7.18 (Perrin 1972)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

39.83, 33.86 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperature designated * are compiled at the end of this section):

18895 ($20^{\circ}C$, shake flask-turbidity, Fühner 1924)

18890 (Fühner 1924; quoted, Hansch et al. 1968)

20380 (estimated, McGowan 1954)

18160 (quoted, Deno & Berkheimer 1960)

18900 (Stephen & Stephen 1963; quoted, Howard 1993)

18895 (shake flask-UV, Hansch et al. 1968)

20430 (generator column-GC, Wasik et al. 1981, 1982; Tewari et al. 1982)

22450 ($20^{\circ}C$, literature average, Verschueren 1983)

23000 (Dean 1985)

23000 ($20^{\circ}C$, lit. average, Riddick et al. 1986)

22600*, 19800 ($20^{\circ}C$, $30^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.2^{\circ}C$, Stephenson & Stuart 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

4152* (interpolated-regression of tabulated data, temp range -26.7 to $101.8^{\circ}C$ Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 8794.8/(T/K)] + 8.212268$; temp range -38.3 to $89^{\circ}C$ (Antoine eq., Weast 1972–73)

4478 (comparative ebulliometry, fitted to Antoine eq., Ambrose et al. 1981)

$\log(P/kPa) = 6.14362 - 1284.080/(T/K) - 64.364$; temp range 290.3 – 398.908 K (Antoine eq., ebulliometry, Ambrose et al. 1981)

4494 (interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.16547 - 1297.186/(210.301 + t/^{\circ}C)$; temp range 17.13 – $125.8^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 6.14152 - 1282.545/(208.628 + t/^{\circ}C)$; temp range 39.8 – $100.9^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

- 4486 (extrapolated-Antoine eq., Dean 1985)
 $\log(P/\text{mmHg}) = 7.01615 - 1282.28/(208.6 + t/^{\circ}\text{C})$, temp range: 39–101°C (Antoine eq., Dean 1985, 1992)
 4497 (quoted lit average, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.14362 - 1284.080/(208.786 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log(P_L/\text{kPa}) = 6.142106 - 1282.873/(-64.486 + T/\text{K})$; temp range 312–374 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.48937 - 1544.31/(-30.623 + T/\text{K})$; temp range 374–542 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.13951 - 1281.682/(-64.58 + T/\text{K})$; temp range 312–374 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log(P/\text{mmHg}) = 43.0548 - 3.4692 \times 10^3/(T/\text{K}) - 12.217 \cdot \log(T/\text{K}) + 2.4748 \times 10^{-10} \cdot (T/\text{K}) + 3.7508 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 178–549 K (vapor pressure eq., Yaws et al. 1994)
 9586 (40°C, vapor-liquid equilibrium VLE data, Alderson et al. 2003)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

- 20.150 (exptl., Hine & Mookerjee 1975)
 22.092, 20.62 (calculated-group contribution, bond contribution, Hine & Mookerjee 1975)
 22.09 (vapor-liquid equilibrium, headspace-GC, measured range 25–40°C, data presented in graph, $\Delta H = 43.2 \text{ kJ/mol}$, Kieckbusch & King 1979)
 30.50 (calculated-MCI χ , Nirmalakhandan & Speece 1988)
 82.91, 203.7, 290.5, 387.3 (40, 60, 70 80°C, equilibrium headspace-GC, Kolb et al. 1992)
 $\ln(1/K_{\text{AW}}) = -9.27 + 3971/(T/\text{K})$, temp range 40–80°C (equilibrium headspace-GC, Kolb et al. 1992)
 10.10 (calculated-molecular structure, Russell et al. 1992)
 16.13 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 5.519 - 2257/(T/\text{K})$, (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 1.23 (calculated, Hansch et al. 1968; quoted, Leo et al. 1969)
 1.11 (calculated-activity coeff. γ , Wasik et al. 1981)
 1.24 (generator column-GC, Wasik et al. 1981, 1982; Tewari et al. 1982)
 1.23 (Hansch & Leo 1985)
 1.24 (recommended, Sangster 1989, 1993)
 1.24 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

- 3.17 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

- 0.380, 0.708 (calculated-S, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1993)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 1.288, 2.045 (soil, calculated-S, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: based on Henry's law constant, $t_{1/2} \sim 6.5 \text{ h}$ from a model river of one meter deep flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1993).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

exptl. photooxidation rate constant of 2.4 to $4.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with the photochemically produced hydroxyl radicals in the atmosphere (Conkle et al. 1975; Atkinson et al. 1979; Ambrose et al. 1981; Atkinson 1985, 1987; Drossman et al. 1988; quoted, Howard 1993)

photooxidation half-life of 2.4–24 h for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{\text{OH}} = 4.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $305 \pm 2 \text{ K}$ using relative rate technique for 2-methylpropene (Winer et al. 1977; quoted, Atkinson 1985)

$k_{\text{OH}} = (1.7 \pm 0.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (Zetzsch 1982; quoted, Atkinson 1985)

$k_{\text{OH}}(\text{calc}) = 2.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 4.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{\text{OH}}(\text{calc}) = 2.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 2.51 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}} = (34.5 \pm 3.4) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a)

$k_{\text{OH}} = 3.45 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 2.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{\text{OH}} = 3.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 2.54 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1996)

Hydrolysis: alkaline hydrolysis rate constant $k = 0.087 \text{ M}^{-1} \text{ s}^{-1}$ at 25°C in water (Salmi & Leimu 1947; quoted, Drossman et al. 1988).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 2.4\text{--}24 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radicals (Darnall et al. 1976);

$t_{1/2} = 3.39\text{--}6.69 \text{ d}$, based on exptl. rate constant for the vapor-phase reaction with the photochemically produced hydroxyl radical in the atmosphere (Conkle et al. 1975; Atkinson et al. 1979; Ambrose et al. 1981; Atkinson 1985, 1987; Drossman et al. 1988; quoted, Howard 1993).

15.1.1.8 Butyl acetate

Common Name: Butyl acetate

Synonym: acetic acid butyl ester, butyl ethanoate, *n*-butyl acetate, ethanoic acid butyl ester

Chemical Name: butyl acetate, *n*-butyl acetate

CAS Registry No: 123-86-4

Molecular Formula: $C_6H_{12}O_2$, $CH_3COOCH_2CH_2CH_2CH_3$

Molecular Weight: 116.158

Melting Point ($^{\circ}C$):

-78 (Lide 2003)

Boiling Point ($^{\circ}C$):

126.1 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8825 (Weast 1982-83)

0.8764 (Riddick et al. 1986)

Molar Volume (cm^3/mol):

132.5 ($20^{\circ}C$, calculated-density)

155.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

23.28 (pK_s , Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

43.64, 35.81 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

23550 (Seidell 1941)

23180 (estimated, McGowan 1954)

4955 (Deno & Berkheimer 1960)

23580 (shake flask-spectrophotometry, Hansch et al. 1968)

7040 ($20^{\circ}C$, quoted, Amidon et al. 1975)

6702 (generator column-GC, Wasik et al. 1981, 1982; Tewari et al. 1982)

3936 (Hine & Mookerjee 1975)

5000, 14000 (Verschuereen 1983)

4300 (Dean 1985)

8400 (shake flask-radiometric method, Lo et al. 1986)

6800 ($20^{\circ}C$, quoted lit. average, Riddick et al. 1986)

6400*, 5200 ($19.7^{\circ}C$, $30.3^{\circ}C$, shake flask-GC/TC, measured range $0-90.5^{\circ}C$, Stephenson & Stuart 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

$\log(P/mmHg) = 8.099 - 1964/(253 + t/^{\circ}C)$ (Davis 1941)

1560* ($24.5^{\circ}C$, measured range $24.5-94.1^{\circ}C$, Usanovich & Dembicij 1959)

9210* ($59.74^{\circ}C$, temp range $59.74-126.09^{\circ}C$, Kliment et al. 1964; quoted, Boublik et al. 1984)

3386* ($67.9^{\circ}C$, ebulliometry, measured range $67.9-124.0^{\circ}C$, Sheehan & Langer 1969)

1505 (Hoy 1970)

$\log(P/mmHg) = 6.9688 - 1326.7/(199.2 + t/^{\circ}C)$; temp range $67.0-130^{\circ}C$ (ebulliometry, Sheehan & Langer 1969)

$\log(P/mmHg) = [-0.2185 \times 9300.8/(T/K)] + 8.095046$; temp range -21.2 to $118^{\circ}C$ (Antoine eq., Weast 1972-73)

1440 (quoted, Hine & Mookerjee 1975)

- 1333 (20.0°C, Verschueren 1983)
 1530, 1138 (extrapolated-Antoine eq., interpolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.25496 - 1432.217/(210.936 + t/^\circ\text{C})$; temp range 59.74–126°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 4.7514 - 669.809/(117.657 + t/^\circ\text{C})$; temp range 24.5–94.1°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 1529 (extrapolated-Antoine eq., Dean 1985)
 $\log(P/\text{mmHg}) = 7.12712 - 1430.418/(210.746 + t/^\circ\text{C})$; temp range 60–126°C (Antoine eq., Dean 1985, 1992)
 1664 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.151445 - 1368.051/(203.9298 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log(P_L/\text{kPa}) = 6.176 - 1385.8/(-67.05 + T/\text{K})$; temp range 332–399 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.13505 - 1355.816/(-70.705 + T/\text{K})$; temp range: 341–399 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 2000, 635 (measured, calculated-solvatochromic parameters, Banerjee et al. 1990)
 $\log(P/\text{mmHg}) = 4.383 - 2.7134 \times 10^3/(T/\text{K}) + 3.9835 \cdot \log(T/\text{K}) - 1.6575 \times 10^{-2} \cdot (T/\text{K}) + 9.7246 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 200–579 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 33.44 (exptl., Hine & Mookerjee 1975)
 30.50, 31.21 (calculated-group contribution, calculated-group contribution, Hine & Mookerjee 1975)
 28.51 (vapor-liquid equilibrium, headspace-GC, measured range 25–40°C data presented in graph, $\Delta H = 47.6 \text{ kJ/mol}$, Kieckbusch & King 1979)
 38.39 (predicted-MCI χ , Nirmalakhandan & Speece 1988)
 82.91* (40°C, equilibrium headspace-GC, measured range 40–80°C, Kolb et al. 1992)
 20.2 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 6.400 - 2486/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 1.73 (calculated, Hansch et al. 1968; quoted, Leo et al. 1969)
 1.69 (calculated-activity coeff. γ , Wasik et al. 1981)
 1.82 (generator column-GC, Wasik et al. 1981, 1982; Tewari et al. 1982)
 1.78 (24°C, shake flask-GC, Catz & Friend 1989)
 1.82 (recommended, Sangster 1989, 1993)
 1.78 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C:

- 3.65 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

- 0.602, 1.146 (calculated-S, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 1.531, 2.367 (soil, calculated-S, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} \sim 6.1 \text{ h}$ was estimated for a model river 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s and an estimated $t_{1/2} \sim 7.4 \text{ d}$ for a 10 m deep similar model river (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 2.4\text{--}24 \text{ h}$ for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976)

$k_{\text{OH}}(\text{calc}) = 4.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 4.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp.
(SAR structure-activity relationship, Atkinson 1987)

photooxidation $t_{1/2} = 6.0 \text{ d}$ in air was estimated for the vapor-phase reaction with an average atmospheric OH of $8 \times 10^5/\text{cm}^3$ (GEMS 1986; quoted, Howard 1990)

$k_{\text{OH}} = (41.5 \pm 3.0) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (flash photolysis-resonance fluorescence, Wallington et al. 1988)

$k_{\text{OH}} = 4.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Hydrolysis: alkaline hydrolysis rate constant $k = 0.087 \text{ M}^{-1}\cdot\text{s}^{-1}$ at 25°C in water (Salmi & Leimu 1947; quoted, Drossman et al. 1988);

$t_{1/2} = 3.1 \text{ yr}$, 114 d, 11.4 d at pH 7.0, 8.0, 9.0 were estimated, respectively, based on observed acid and base-catalyzed rate constants at 20°C (Mabey & Mill 1978; quoted, Howard 1990).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 2.4\text{--}24 \text{ h}$ for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

$t_{1/2} = 6.0 \text{ d}$ was estimated for the vapor-phase reaction with an average atmospheric hydroxyl radical of $8 \times 10^5 \text{ per cm}^3$ (GEMS 1986; quoted, Howard 1990).

15.1.1.9 Pentyl acetate

Common Name: Pentyl acetate

Synonym: acetic acid pentyl ester, amyl acetate, amylacetic ester, pentyl ethanoate, *n*-pentyl acetate, ethanoic acid pentyl ester

Chemical Name: *n*-amyl acetate, *n*-pentyl acetate

CAS Registry No: 628-63-7

Molecular Formula: $C_7H_{14}O_2$, $CH_3COOCH_2CH_2CH_2CH_2CH_3$

Molecular Weight: 130.185

Melting Point ($^{\circ}C$):

-70.8 (Weast 1982–83; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

149.2 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8756 (Weast 1982–83)

0.8766, 0.8719 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

148.5 ($20^{\circ}C$, calculated-density)

177.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

24.25 (pK_s , Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

41.0 (at bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

1730 (shake flask-turbidimeter, McBain & Richards 1946)

1800 ($20^{\circ}C$, Verschueren 1983)

1700 (Dean 1985)

1700 ($20^{\circ}C$, Riddick et al. 1986)

2200*, 1600 ($19.7^{\circ}C$, $30.3^{\circ}C$, shake flask-GC/TC, measured range 0 – $80^{\circ}C$, Stephenson & Stuart 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P/mmHg) = 8.078 - 2077/(253 + t/^{\circ}C)$ (Davis 1946)

547 (quoted, Hine & Mookerjee 1975)

546 (quoted, Abraham 1984)

1290 (selected lit., Riddick et al. 1986)

$\log(P/kPa) = 5.4315 - 1197/(200 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

$\log(P_L/kPa) = 7.356 - 2258.3/(T/K)$; temp range 329–423 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 7.8848 - 3.0696 \times 10^3/(T/K) + 2.7085 \cdot \log(T/K) - 1.5165 \times 10^{-2} \cdot (T/K) + 8.7135 \times 10^{-6} \cdot (T/K)^2$;
temp range 202–598 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

39.29 (exptl., Hine & Mookerjee 1975)

42.10, 42.16 (calculated-group contribution, calculated-group contribution, Hine & Mookerjee 1975)

35.94 (vapor-liquid equilibrium, headspace-GC, measured range 25 – $40^{\circ}C$ data presented in graph,
 $\Delta H = 51.4\ kJ/mol$, Kieckbusch & King 1979)

48.33 (calculated-MCI χ , Nirmalakhandan & Speece 1988)

- 38.39 (calculated-molecular structure, Russell et al. 1992)
 24.86 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 7.167 - 2685/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 1.70 (calculated, Iwasa et al. 1965)
 2.23 (Leo et al. 1969)
 2.42 (calculated- V_1 and solvatochromic parameters, Leahy 1986)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 4.12 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

photooxidation $t_{1/2} = 2.4\text{--}24$ h for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976).

Hydrolysis:

Biodegradation: biodegradation rates $k = 0.054\text{ d}^{-1}$ with $t_{1/2} = 13$ d in Lester river, $k = 0.069\text{ d}^{-1}$ with $t_{1/2} = 10$ d in Superior harbor waters and $k = 0.014\text{ d}^{-1}$ with $t_{1/2} = 50$ d in groundwater (Vaishnav & Babeu 1987).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 2.4\text{--}24$ h for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976).

Surface water: biodegradation $t_{1/2} = 13$ d in Lester river and $t_{1/2} = 10$ d in Superior harbor waters (Vaishnav & Babeu 1987).

Groundwater: biodegradation $t_{1/2} = 50$ d (Vaishnav & Babeu 1987).

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: photooxidation $t_{1/2} = 2.37\text{--}22.7$ h in air, based on estimated rate constants for the vapor phase reaction with hydroxyl radical (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: overall rate constant $k_h = 6.3 \times 10^{-9} \text{ s}^{-1}$ with $t_{1/2} = 3.5$ yr at 25°C and pH 7; acid rate constant $k_A = 1.2 \times 10^{-13} \text{ s}^{-1}$ and base rate constant $k_B = 7.8 \times 10^{-9} \text{ s}^{-1}$ at 25° and pH 7 (Mabey & Mill 1978)

$t_{1/2} = 2.8$ yr at pH 7 and 25°C , based on acid and base catalyzed hydrolysis rate constants; acid rate constant $k_A = 1.2 \times 10^{-6} \text{ M}^{-1} \text{ s}^{-1}$ with $t_{1/2} = 244$ yr at pH 5; measured base rate constant $k_B = 0.078 \text{ M}^{-1} \cdot \text{h}^{-1}$ with $t_{1/2} = 10.4$ d at pH 9 and 25°C (Mabey & Mill 1978; quoted, Howard et al. 1991);

calculated rate constant for base-catalyzed hydrolysis $k_B = 5.0 \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$ and estimated $t_{1/2} \sim 25$ d in aqueous solutions at pH 8.8 (Freidig et al. 1999).

Biodegradation: aqueous aerobic $t_{1/2} = 24\text{--}168$ h, based on aqueous aerobic screening test data (Price et al. 1974; Sasaki 1978; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 96\text{--}672$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 2.37\text{--}22.7$ h, based on estimated rate constants for the vapor phase reaction with hydroxyl radical (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: hydrolysis $t_{1/2} = 3.5$ yr at 25°C and pH 7 (Mabey & Mill 1978)

$t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 48\text{--}336$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

15.1.1.12 Methyl methacrylate

Common Name: Methyl methacrylate

Synonym: methyl 2-methyl-2-propenoate, methyl ester methacrylic acid, methacrylic acid methyl ester, MMA

Chemical Name: 2-methyl-2-propenoic acid methyl ester

CAS Registry No: 80-62-6

Molecular Formula: $C_5H_8O_2$, $H_2C=C(CH_3)COOCH_3$

Molecular Weight: 100.117

Melting Point ($^{\circ}C$):

−47.55 (Lide 2003)

Boiling Point ($^{\circ}C$):

100.5 (Lide 2003)

Flash Point ($^{\circ}C$): 10

Density (g/cm^3 at $20^{\circ}C$):

0.9440 (Weast 1982–83)

Molar Volume (cm^3/mol):

106.6 ($25^{\circ}C$, Stephenson & Malanowski 1987)

121.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

40.7, 36.0 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

16000 (Dean 1985)

15000 (USEPA 1985; ENVIROFATE; ISHOW)

15900 (Yalkowsky et al. 1987)

15600 ($20^{\circ}C$, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

5332*, 4888 ($25.5^{\circ}C$, interpolated-regression of tabulated data, temp range -30.5 to $101^{\circ}C$, Stull 1947)

1315* ($3.44^{\circ}C$, temp range -45.26 to $3.44^{\circ}C$, Bywater 1952; quoted, Boublik et al. 1984)

$\log(P/mmHg) = [-0.2185 \times 8794.9/(T/K)] + 8.140942$; temp range -30.5 to $101^{\circ}C$ (Antoine eq., Weast 1972–73)

3732, 5333 ($20^{\circ}C$, $26^{\circ}C$, Verschuere 1977, 1983)

7003* ($32.489^{\circ}C$, temp range 32.489 – $99.855^{\circ}C$, Boublik & Aim 1979; quoted, Boublik et al. 1984)

5333 ($25.5^{\circ}C$, Weast 1982–83)

4440 (extrapolated average-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 3.20496 - 4017.882/(126.685 + t/^{\circ}C)$; temp range -45.26 to $3.44^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 6.19400 - 1315.670/(213.490 + t/^{\circ}C)$; temp range: 32.41 – $99.855^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

4846 (extrapolated-Antoine equation, Dean 1985)

$\log(P/mmHg) = 8.4092 - 2050.5/(274.4 + t/^{\circ}C)$; temp range: 39 – $89^{\circ}C$ (Antoine eq., Dean 1985, 1992)

5100 (lit. average, Riddick et al. 1986)

$\log(P/kPa) = 7.83859 - 2126.21/(T/K)$, temp range 0 – $30^{\circ}C$ (Antoine eq., Riddick et al. 1986)

5081, 5020 (interpolated-Antoine eq.-I and II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.63751 - 1597.9/(-28.76 + T/K)$; temp range: 293 – 374 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.43088 - 1461.197/(-43.15 + T/\text{K})$; temp range: 293–373 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 106.896 - 5.2741 \times 10^3/(T/\text{K}) - 37.654 \cdot \log(T/\text{K}) + 1.862 \times 10^{-2} \cdot (T/\text{K}) - 3.6507 \times 10^{-13} \cdot (T/\text{K})^2$;
temp range 225–564 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

24.31 (calculated-P/C, USEPA 1985)
32.823 (calculated-P/C, Howard 1989)
32.09 (calculated-P/C, this work)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.73 (Tute 1971; Laurence et al. 1972)
0.70 (shake flask, Fujisawa & Masuhara 1981)
0.67 (HPLC-RT correlation, Fujisawa & Masuhara 1981)
1.36 (CLOGP, Hansch & Leo 1982)
1.38 (shake flask-GC, Tanii & Hashimoto 1982)
0.79 (calculated-f const. as per Lyman et al. 1982, USEPA 1985)
1.38 (recommended, Sangster 1989)
1.38 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

−0.03 (correlated as per Veith et al. 1979 for aquatic organisms, USEPA 1985)
0.55 (calculated- K_{OW} , Howard 1989)

Sorption Partition Coefficient, $\log K_{OC}$:

1.80 (calculated- K_{OW} as per Lyman et al. 1982, USEPA 1985)
1.94 (calculated- K_{OW} , Howard 1989)
0.74 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 6.3$ h from model river water (Lyman et al. 1982; quoted, Howard 1989).

Photolysis: photodegradation $t_{1/2} = 2.7$ h in air of urban areas and $t_{1/2} > 3$ h in rural areas (Joshi et al. 1982; quoted, Howard 1989) (CHEMFATE; Hazardous Substance Databank).

Oxidation: photooxidation $t_{1/2} = 1.1$ – 9.7 h in air, based on estimated rate constants for the vapor phase reaction with hydroxyl radical (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: alkaline hydrolysis rate constant at 25°C, $k = 171 \text{ M}^{-1} \text{ h}^{-1}$ (Sharma & Sharma 1970; quoted, Ellington et al. 1987; Ellington 1989);

alkaline catalyzed rate constant $k(\text{exptl}) = 200 \text{ M}^{-1} \cdot \text{h}^{-1}$ at 25°C with estimated $t_{1/2} \sim 3.9$ yr at pH 7 and $t_{1/2} = 14$ d at pH 9 (Ellington et al. 1987; quoted, Ellington 1989; Howard 1989; Howard et al. 1991; Kollig 1993);

hydrolysis $t_{1/2} = 4$ yr at pH 7 and 25°C; base rate constant $k = 200 \text{ M}^{-1} \text{ h}^{-1}$ with $t_{1/2} = 14.4$ d at pH 9 based on measured rate constant at 25°C and pH 11 (Howard et al. 1991)

$k(\text{calc}) = 9.0 \times 10^{-7} \text{ M}^{-1} \text{ s}^{-1}$, $2.6 \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$ for neutral and base-catalyzed hydrolysis and estimated $t_{1/2} \sim 8$ d in aqueous solutions at pH 8.8 (Freidig et al. 1999)

Biodegradation: completely degraded by activated sludge in approximately 20 h (Slave et al. 1974; quoted, EPA 1985; Howard 1989; Hazardous Substance Databank);

expert systems survey found that both aerobic ultimate degradation in receiving waters and anaerobic ultimate degradation were within a month and aerobic primary degradation in receiving waters was within few days (Boethling et al. 1989);

aqueous aerobic $t_{1/2} = 168$ – 672 h, based on unacclimated screening test data (Pahren & Bloodgood 1961; Sasaki 1978; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 672$ – 2688 h, based on unacclimated aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 1.1\text{--}9.7$ h, based on estimated rate constants for the vapor phase reaction with hydroxyl radical (Atkinson 1987; quoted, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be < 1 to $1\text{--}5$ d (Kelly et al. 1994).

Surface water: $t_{1/2} = 168\text{--}672$ h, based on estimated aqueous unacclimated aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 336\text{--}1344$ h, based on estimated aqueous unacclimated aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 168\text{--}672$ h, based on estimated aqueous unacclimated aerobic biodegradation half-life (Howard et al. 1991).

15.1.2 AROMATIC ESTERS

15.1.2.1 Methyl benzoate

Common Name: Methyl benzoate

Synonym: benzoic acid methyl ester

Chemical Name: methyl benzoate

CAS Registry No: 93-58-3

Molecular Formula: $C_8H_8O_2$, $C_6H_5COOCH_3$

Molecular Weight: 136.149

Melting Point ($^{\circ}C$):

-12.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

199 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.08854, 1.08377 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955)

Molar Volume (cm^3/mol):

125.0 (Stephenson & Malanowski 1987)

151.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

41.18, 55.84 (normal bp, $25^{\circ}C$, Dreisbach 1955)

43.18, 55.568 (normal bp, $25^{\circ}C$, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

9.736 (Dreisbach 1955; Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

1524 (titration, Booth & Everson 1948)

4018 (Hine & Mookerjee 1975)

2100 ($20^{\circ}C$, quoted, Riddick et al. 1986)

1600 (calculated-MCI χ , Nirmalakhandan & Speece 1988)

2130*, 2820 ($20.1^{\circ}C$, $29.6^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.5^{\circ}C$, Stephenson & Stuart 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log (P/mmHg) = 7.48253 - 1974.6/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

52.58 (calculated by formula, Dreisbach 1955)

$\log (P/mmHg) = 7.07832 - 1656.25/(195.23 + t/^{\circ}C)$; temp range: 100 – $260^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

$\log (P/mmHg) = [-0.2185 \times 12077.2/(T/K)] + 8.509910$; temp range: 39 – $199.5^{\circ}C$ (Antoine eq., Weast 1972–73)

77.6 (extrapolated-Antoine eq., Dean 1985)

$\log (P/mmHg) = 6.60743 - 1974.6/(230.0 + t/^{\circ}C)$; temp range 111 – $199^{\circ}C$ (Antoine eq., Dean 1985, 1992)

52.58 (quoted lit. average, Riddick et al. 1986)

$\log (P/kPa) = 6.60743 - 1974.6/(230 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

54.5 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 8.183 - 2816.6/(T/K)$; temp range 283 – $323 K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.20322 - 1656.25/(-77.92 + T/\text{K})$; temp range: 383–533 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = -13.6342 - 2.9133 \times 10^3/(T/\text{K}) + 11.773 \cdot \log (T/\text{K}) - 2.3979 \times 10^{-2} \cdot (T/\text{K}) + 1.1324 \times 10^{-5} \cdot (T/\text{K})^2$;
temp range 261–693 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

- 1.80 (calculated- C_w/C_A , Hine & Mookerjee 1975)
- 2.48 (calculated-bond contribution, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 2.15 (HPLC-RT correlation, D'Amboise & Hanai 1982)
- 2.22 (HPLC- k' correlation, Haky & Young 1984)
- 2.14 (shake flask-HPLC, Nielson & Bundgaard 1988)
- 2.10 (recommended, Klein et al. 1988)
- 2.15 (RP-HPLC-RT correlation, ODS column with masking agent, Bechalany et al. 1989)
- 2.20 (recommended, Sangster 1989)
- 2.12 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.30, 2.01, 1.98 (Podzol soil, Alfisol soil, sediment, von Oepen et al. 1991)
- 1.89 (calculated-MCI χ , Meylan et al. 1992)
- 2.10 (quoted or calculated-QSAR MCI $^1\chi$, Sabljic et al. 1995)
- 2.14; 2.57, 2.14, 1.94, 2.16, 1.89 (soil: calculated- K_{ow} ; HPLC-screening method using LC-columns of different stationary phases, Szabo et al. 1999)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis: overall rate constant $k_h = 1.90 \times 10^{-10} \text{ s}^{-1}$ with $t_{1/2} = 118 \text{ yr}$ at 25°C and pH 7 (Mabey & Mill 1978)
alkaline hydrolysis rate constant $k = 0.0794 \text{ M}^{-1} \text{ s}^{-1}$ (Drossman et al. 1988, quoted, Collette 1990)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants::

Half-Lives in the Environment:

Air:

Surface water: hydrolysis $t_{1/2} = 118 \text{ yr}$ at 25°C and pH 7 (Mabey & Mill 1978)

Groundwater:

Sediment:

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

42.1 (extrapolated-regression of tabulated data, temp range $44-213.4^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 11981.5/(T/K)] + 8.279591$; temp range $44-213.4^{\circ}C$ (Antoine eq., Weast 1972-73)

24.0 ($20^{\circ}C$, quoted lit., Riddick et al. 1986)

$\log(P/kPa) = 7.7579 - 2750.0/(T/K)$; temp range $90-140^{\circ}C$ (Antoine eq., Riddick et al. 1986)

$\log(P/kPa) = 7.1599 - 2500.0/(T/K)$; temp range $140-220^{\circ}C$ (Antoine eq., Riddick et al. 1986)

27.5 (interpolated-Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.81152 - 2174.3/(-34.071 + T/K)$; temp range $358-487 K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 8.23958 - 2922.167/(T/K)$; temp range $288-333 K$ (Antoine eq.-II, Stephenson & Malanowski 1987)

$$\log (P/\text{mmHg}) = 40.8047 - 3.9985 \times 10^3/(T/K) - 11.793 \cdot \log (T/K) + 4.0697 \times 10^{-3} \cdot (T/K) - 1.2372 \times 10^{-13} \cdot (T/K)^2;$$

temp range 238–698 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa·m³/mol at 25°C):

10.298 (calculated-P/C with selected values)

Octanol/Water Partition Coefficient, log K_{ow}:

2.62 (calculated, Hansch et al. 1968)
 2.20 (shake flask-spectrophotometry, Yaguzhinskii et al. 1973)
 2.64 (Valvani et al. 1981, Amidon & Williams 1982)
 2.64 (shake flask-HPLC, Nielsen & Bundgaard 1988)
 2.60 (recommended, Klein et al. 1988)
 2.64 (recommended, Sangster 1989)
 2.66, 2.89, 2.90 (centrifugal partition chromatography CPC-RV, Gluck & Martin 1990)
 2.70 ± 0.15, 2.63 ± 0.57 (solvent generated liquid-liquid chromatography SGLLC-correlation, RP-HPLC-k' correlation, Cichna et al. 1995)
 2.64 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{oc}:

2.25, 2.17, 2.43 (sediment, Alfisol soil, Podzol soil, von Oepen et al. 1991)
 2.16 (calculated-MCI χ and fragment contribution, Meylan et al. 1992)
 2.30 (quoted or calculated-QSAR MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis: overall rate constant k_h = 3.0 × 10⁻⁹ s⁻¹ with t_{1/2} = 7.3 yr at 25°C and pH 7 (Mabey & Mill 1978)
 alkaline hydrolysis rate constant k = 0.0316 M⁻¹ s⁻¹ (Drossman et al. 1988, quoted, Collette 1990)

TABLE 15.1.2.2.1

Reported aqueous solubilities of ethyl benzoate at various temperatures

Stephenson & Stuart 1986

shake flask-GC/TC

t/°C	S/g·m ⁻³
0	1080
19.6	850
30.5	810
40.0	1060
50.0	1080
60.1	1170
70.5	1210
80.2	1210
90.3	1430

FIGURE 15.1.2.2.1 Logarithm of mole fraction solubility (ln x) versus reciprocal temperature for ethyl benzoate.

15.1.2.3 *n*-Propyl benzoate

Common Name: *n*-Propyl benzoate

Synonym: benzoic acid *n*-propyl ester, propyl benzenecarboxylate

Chemical Name: benzoic acid *n*-propyl ester, propyl benzenecarboxylate, propyl benzoate

CAS Registry No: 2315-68-6

Molecular Formula: $C_{10}H_{12}O_2$, $C_6H_5COOCH_2CH_2CH_3$

Molecular Weight: 164.201

Melting Point ($^{\circ}C$):

−51.6 (Weast 1982–83; Riddick et al. 1986; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

211 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0232 (Riddick et al. 1986)

Molar Volume (cm^3/mol):

160.5 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

199.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

51.92; 49.75 ($25^{\circ}C$; bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

350 (quoted exptl., Kamlet et al. 1987)

292 (calculated-intrinsic molar volume V_1 and solvatochromic parameters, Kamlet et al. 1987)

140 (calculated-intrinsic molar volume V_1 and mp, Kamlet et al. 1987)

966 (calculated-MCI χ , Nirmalakhandan & Speece 1988)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

133.3 ($54.6^{\circ}C$, summary of literature data, temp range 54.6 – $231^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 12318.7/(T/K)] + 8.237827$; temp range 54.6 – $231^{\circ}C$ (Antoine eq., Weast 1972–73)

100 ($54.6^{\circ}C$, Riddick et al. 1986)

$\log(P/kPa) = 7.42756 - 2172.71/(T/K)$; temp range 80 – $160^{\circ}C$ (Antoine eq., Riddick et al. 1986)

$\log(P_L/kPa) = 6.68614 - 2165.28/(-41.593 + T/K)$; temp range 327 – 504 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.80 (shake flask-HPLC, Nielsen & Bundgaard 1988)

3.18 (recommended, Sangster 1989)

3.01 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

15.1.2.4 Benzyl benzoate

Common Name: Benzyl benzoate

Synonym: benzoic acid benzyl ester, phenylmethyl benzoate, benzyl benzenecarboxylate, benzyl phenylformate, benzenoate

Chemical Name: benzyl benzoate, phenylmethyl benzoate, benzyl benzenecarboxylate

CAS Registry No: 120-51-4

Molecular Formula: $C_{14}H_{12}O_2$, $C_6H_5COOCH_2C_6H_5$

Molecular Weight: 212.244

Melting Point ($^{\circ}C$):

19.4 (Riddick et al. 1986)

Boiling Point ($^{\circ}C$):

323.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1121 ($25^{\circ}C$, Weast 1982–83)

1.120, 1.1121 ($19.5^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

190.9 ($25^{\circ}C$, calculated-density)

243.6 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

53.56 (at normal bp, Hon et al. 1976)

77.8; 53.6 ($25^{\circ}C$; bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

15.73 (Seidell 1941; quoted, Deno & Berkheimer 1960)

61.21 (calculated-intrinsic molar volume V_1 and solvatochromic parameters, Leahy 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log (P/mmHg) = 6.42726 - 1594.49/(126.36 + t/^{\circ}C)$; temp range 224.7 – $329.09^{\circ}C$ (Antoine eq., from twin ebulliometry measurement, Hon et al. 1976)

0.0137 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 5.59354 - 1628.726/(130.735 + t/^{\circ}C)$; temp range 224.7 – $329^{\circ}C$ (Antoine eq. from reported exptl. data of Hon et al. 1976, Boublik et al. 1984)

461 ($150^{\circ}C$, quoted lit., Riddick et al. 1986)

0.0104 (calculated-Antoine eq., Riddick et al. 1986)

$\log (P/kPa) = 5.55216 - 1594.49/(126.36 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

0.043 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 9.240 - 4057/(T/K)$; temp range 297 – 353 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 5.63847 - 1666.706/(-137.564 + T/K)$; temp range 497 – 602 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P/mmHg) = -1.654 - 4.6284 \times 10^3/(T/K) + 7.363 \cdot \log (T/K) - 1.8259 \times 10^{-2} \cdot (T/K) + 7.4580 \times 10^{-6} \cdot (T/K)^2$; temp range 293 – 820 K (vapor pressure eq., Yaws et al. 1994)

0.0178, 0.0107, 0.0135, 0.295, 0.0603 (GC-RT correlation, Sugden's parachor method, McGowan's parachor method, calculated-MCI, calculated-MW, Tsuzuki 2001)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

0.57 (calculated-P/C with selected values)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

3.86 (quoted, calculated- V_I and solvatochromic parameters, Taft et al. 1985)

4.00 (quoted, calculated- V_I and solvatochromic parameters, Leahy 1986)

3.97 (recommended value, Sangster 1989)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Hydrolysis: overall rate constant $k_h = 8.0 \times 10^{-10} \text{ s}^{-1}$ with $t_{1/2} = 27 \text{ yr}$ at 25°C and pH 7 (Mabey & Mill 1978)

alkaline hydrolysis rate constant $k = 0.00794 \text{ M}^{-1} \text{ s}^{-1}$ (Mabey et al. 1978; quoted, Collette 1990)

15.1.3 PHTHALATE ESTERS

15.1.3.1 Dimethyl phthalate (DMP)

Common Name: Dimethyl phthalate

Synonym: DMP, 1,2-benzenedicarboxylic acid dimethyl ester, dimethyl-1,2-benzenedicarboxylate, methyl Common phthalate, *o*-dimethylphthalate, phthalic acid dimethyl ester

Chemical Name: dimethyl phthalate, dimethyl-*o*-phthalate, methyl phthalate

CAS Registry No: 131-11-3

Molecular Formula: $C_{10}H_{10}O_4$, $o\text{-}C_6H_4(COOCH_3)_2$

Molecular Weight: 194.184

Melting Point ($^{\circ}C$):

5.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

283.7 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.189 ($25^{\circ}C$, Fishbein & Albro 1972)

1.1905 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

162.8 (calculated-density, Stephenson & Malanowski 1987)

206.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

78.66 (Small et al. 1948)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K) F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

3965 (Deno & Berkheimer 1960)

5000 ($20^{\circ}C$, Fishbein & Albro 1972)

4000 ($32^{\circ}C$, from Monsanto Chemical Co. data sheets, Peakall 1975)

4320 ± 37 (shake flask-GC, Wolfe et al. 1980b; Wolfe et al. 1980a)

4248 (shake flask-LSC, Veith et al. 1980)

4290 ($20^{\circ}C$, shake flask-UV, Leyder & Boulanger 1983)

5000, 1744 ($20^{\circ}C$, Verschueren 1983)

4000 ± 60 (shake flask-HPLC/UV, Howard et al. 1985)

2810 ($21^{\circ}C$, shake flask-HPLC/UV, Nielsen & Bundgaard 1989)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

40* ($82^{\circ}C$, ebulliometry, measured range $82\text{--}151^{\circ}C$, Gardner & Brewer 1937)

$\log(P/\text{mmHg}) = 9.117 - 1496.375/(T/K)$; temp range $82\text{--}151^{\circ}C$ (Antoine eq. derived by Kim 1985 from exptl data of Gardner & Brewer 1937)

0.863* (extrapolated-regression of tabulated data, temp range $100.3\text{--}288.7^{\circ}C$ Stull 1947)

0.245 (effusion method, extrapolated-Antoine eq., Small et al. 1948)

$\log(P/\text{mmHg}) = 11.06 - 4113/(T/K)$; temp range $32\text{--}55^{\circ}C$ or pressure range 5×10^{-2} to 10^{-4} mmHg (Antoine eq., effusion method, data presented in graph and Antoine eq., Small et al. 1948)

0.559 ($20^{\circ}C$, calculated-Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 14922.2/(T/K)] + 8.747053$; temp range $100.3\text{--}287^{\circ}C$ (Antoine eq., Weast 1972–73)

0.445 (gas saturation, extrapolated, measured range $60\text{--}100^{\circ}C$, Potin-Gautier et al. 1982)

$\log (P/\text{mmHg}) = 8.899 - 3332.764/(T/K)$; temp range 60–100°C (Antoine eq., Potin-Gautier et al. 1982)
 $\log (P/\text{kPa}) = 3.64598 - 699.876/(51.372 + t/^{\circ}\text{C})$; temp range 82–151°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{mmHg}) = 4.52232 - 700.31/(51.42 + t/^{\circ}\text{C})$; temp range 82–151°C (Antoine eq., Dean 1985, 1992)
 0.220 (gas saturation-HPLC/UV, Howard et al. 1985; quoted, Howard et al. 1986; Howard 1989; Banerjee et al. 1990)
 0.245, 0.863 (extrapolated-Antoine eq.-I, II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 10.185 - 4113/(T/K)$; temp range 304–371 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 8.095 - 3327/(T/K)$; temp range 371–547 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 1.190 (GC-RT correlation, Hinckley et al. 1990)
 $\log (P/\text{mmHg}) = 12.6974 - 4.1989 \times 10^3/(T/K) + 0.3463 \cdot \log(T/K) - 7.6524 \times 10^{-3} \cdot (T/K) + 3.349 \times 10^{-6} \cdot (T/K)^2$;
 temp range 272–766 K (vapor pressure eq., Yaws et al. 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

0.111 (calculated-P/C, Fishbein & Albro 1972)
 0.111 (calculated-P/C, Wolfe et al. 1980a)
 0.011 (calculated as per Lyman et al. 1982; quoted, Howard 1989)
 0.218 (20°C, calculated-P/C, Mabey et al. 1982)
 0.012 (selected, Staples et al. 1997)
 0.00978 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.61 (shake flask-LSC, Veith et al. 1980; Veith & Kosian 1983)
 1.56 (HPLC-RT correlation, Veith et al. 1980)
 1.62, 1.82 (HPLC- k' correlations, McDuffie 1981)
 1.53 (20°C, shake flask-UV, Leyder & Boulanger 1983)
 1.47, 1.90 (shake flask-HPLC/UV, HPLC-RT correlation, Howard et al. 1985)
 1.56 (shake flask, unpublished data, Hansch & Leo 1985; 1987)
 1.66 (shake flask, average from interlaboratory study, Renberg et al. 1985)
 1.74, 1.61 (HPLC, RP-TLC, average from interlaboratory study, Renberg et al. 1985)
 1.62 (HPLC-RT correlation, Eadsforth 1986)
 1.46 (shake flask-HPLC/UV, Nielsen & Bundgaard 1989)
 1.56 (recommended, Sangster 1993)
 1.56 (recommended, Hansch et al. 1995)
 1.61 (recommended, Staples et al. 1997)
 1.54 (micro-emulsion electrokinetic chromatography-retention factor correlation, Poole et al. 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.01 (calculated-QSPR, Cousin & Mackay 2000)

Bioconcentration Factor, $\log \text{BCF}$:

0.67 (calculated- K_{OW} , Veith et al. 1979, 1980)
 1.76 (bluegill sunfish, Barrows et al. 1980)
 1.76 (bluegill sunfish, Veith et al. 1980; Veith & Kosian 1983)
 1.42 (bacteria, calculated- K_{OW} , Wolfe et al. 1980a)
 0.49–0.8, 0.67–0.78 (shrimp, fish, Wofford et al. 1981)
 1.20 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
 0.77 (sheepshead minnow, quoted from Wofford et al. 1981, Zaroogian et al. 1985)
 1.76, 2.22 (quoted, calculated-MCI χ , Sabljic 1987)
 0.67, 0.73 (brown shrimp, sheepshead minnow, quoted, Howard 1989)
 1.76 (fish, highest fish BCF, Matthiessen et al. 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

1.64 (soil, estimated, Kenaga 1980)
 2.20 (soil, estimated- K_{OW} , Wolfe et al. 1980a)

- 1.74 (soil/sediment, Osipoff et al. 1981)
 1.24 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 1.52 (sediment, calculated- K_{OW} , Pavlou & Weston 1983, 1984)
 2.69 (activated carbon, calculated- MCI χ , Blum et al. 1994)
 1.20 (calculated- K_{OW} , Kollig 1993)
 1.60 (quoted or calculated-QSAR MCI χ , Sabljic et al. 1995)
 4.70 (suspended solids, calculated- K_d assuming a 0.10 organic carbon fraction, Staples et al. 1997)
 1.64, 2.14; 2.16, 1.87, 2.53, 1.83, 1.67 (soil: quoted lit., calculated- K_{OW} ; HPLC-screening method using LC-columns of different stationary phases, Szabo et al. 1999)

Environmental Fate Rate Constant, k , and Half-Lives $t_{1/2}$:

- Volatilization: estimated $t_{1/2} = 46$ d from a river of 1 m deep with 1.0 m/s current and a 3.0 m/s wind using calculated Henry's law constant and considering the volatilization rate being controlled by the diffusion through the air layer (Lyman et al. 1982; quoted, Howard 1989).
- Photolysis: direct $k_p = 2 \times 10^{-4} \text{ h}^{-1}$ (EXAMS model, Wolfe et al. 1980a);
 abiotic degradation $t_{1/2} = 3500$ h for direct sunlight in surface waters and $t_{1/2} = 12.7$ h in pure water but reduced to 2.8 h in the presence of NO_2 when irradiated with a UV lamp through a Pyrex filter (Howard 1989)
 Indirect photolysis rate $k = 0.048 \text{ d}^{-1}$ with $t_{1/2} = 14.4$ d in air (Peterson & Staples 2003)
- Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k(\text{aq.}) = 18 \text{ M}^{-1} \text{ s}^{-1}$ for reaction with free radical in aqueous environment (Wolfe et al. 1980a)
 $k(\text{aq.}) \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $0.05 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982)
 photooxidation $t_{1/2} = 23.8$ h (estimated, Howard 1989)
 atmospheric $t_{1/2} = 112\text{--}1118$ h, based on estimated rate data for the reaction with OH radical in air (Howard et al. 1991)
 $k(\text{aq.}) = (0.20 \pm 0.10) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and $21 \pm 1^\circ\text{C}$, with a $t_{1/2} = 1.9$ d at pH 7 (Yao & Haag 1991).
 $k(\text{aq.}) = 4 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with OH radical in aqueous solution (Haag & Yao 1992)
 photooxidation $t_{1/2}(\text{predicted}) = 9.3\text{--}93$ d from Atkinson 1988 atmospheric-oxidation program (Staples et al. 1997)
 $k_{OH} = 5.74 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 14.4$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)
- Hydrolysis: $k(\text{acid-catalyzed}) = 0.04 \text{ M}^{-1} \text{ h}^{-1}$, $k(\text{alkaline}) = 2.5 \times 10^2 \text{ M}^{-1} \text{ h}^{-1}$; phthalates are susceptible to alkaline hydrolysis, with theoretical $t_{1/2} = 4$ month to 100 yr at pH 8 and 30°C (Wolfe et al. 1980a)
 $k(\text{second-order alkaline}) = 6.9 \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$ at pH 8 and 30°C , and $t_{1/2} = 4$ months for hydrolytic degradation in the eutrophic lake system (Wolfe et al. 1980b; quoted, Kollig 1993)
 $k(\text{second-order alkaline}) = 6.9 \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$ at pH 10–12 and 30°C in water with $t_{1/2}(\text{calc}) = 3.2$ yr at pH 7 (Callahan et al. 1979)
 hydrolysis half-lives: $t_{1/2} = 3.2$ yr under natural conditions at 30°C , $t_{1/2} = 11.6$ d at 30°C and $t_{1/2} = 25$ d at 18°C and at pH 9 (Howard 1989; selected, Staples et al. 1997);
 first-order hydrolysis $t_{1/2} = 1163$ d based on a second-order rate constant at pH 7 and 30°C ; and a base rate constant $k = 111.6 \text{ M}^{-1} \text{ h}^{-1}$ corresponding to $t_{1/2} = 1.2$ d at pH 9 and 18°C (Howard et al. 1991)
 $t_{1/2} = 1200$ d at pH 7, $t_{1/2} = 0.026$ d at pH 12 in natural waters (Capel & Larson 1995)
- Biodegradation: calculated rate constant $k = (9.49 \pm 0.41) \times 10^2 \text{ min}^{-1}$ from retention times in reverse phase chromatography (Urushigawa & Yonezawa 1979; quoted, O'Grady et al. 1985);
 significant degradation with rapid adaption within 7 d in an aerobic environment with a rate $k > 0.5 \text{ d}^{-1}$ (Tabak et al. 1981; quoted, Mills et al. 1982);
 biodegradation rate constant $k = 1.2 \times 10^{-4} \text{ mL-cell}^{-1} \cdot \text{d}^{-1}$ in river die-away test (Scow 1982);
 58–88% mineralization in 7 d in municipal digested sludge (Horowitz et al. 1982);
 rate constant $k = 0.364 \text{ d}^{-1}$ which corresponds to $t_{1/2} = 1.90$ d in shake flask biodegradation experiments (Sugatt et al. 1984);
 greater than 90% of DMP was degraded within 40 d in digested sludge (Shelton et al. 1984);
 biodegraded in excess of 90% in activated sludge systems in less than 24 h (O'Grady et al. 1985);
 soil-water biodegradation studies showed that 85% loss in Broome County soil after 120 hours and 75% loss in leachate sprayed soil after 48 h (Russell et al. 1985);

anaerobic digestion of sludge with a first-order $k = 8.9 \times 10^{-3} \text{ h}^{-1}$ and $t_{1/2} = 78 \text{ h}$ (Ziogou et al. 1989); aqueous aerobic $t_{1/2} = 24\text{--}168 \text{ h}$, based on unacclimated aerobic river die-away test data and acclimated aerobic soil grab sample data; aqueous anaerobic $t_{1/2} = 96\text{--}672 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 3 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 28 \text{ d}$ in natural waters (Capel & Larson 1995)

$k = 0.0290 \text{ h}^{-1}$ with $t_{1/2} = 23.9 \text{ h}$ for microbial degradation by anaerobic sludge (Wang et al. 2000)

Aerobic biodegradation in aquatic environments, first order $k = 0.5 \text{ d}^{-1}$ with $t_{1/2} = 1.39 \text{ d}$ in river water, $k = 0.5 \text{ d}^{-1}$ with $t_{1/2} = 1.39 \text{ d}$ in MITI inoculum (Peterson & Staples 2003)

Aerobic biodegradation in soil, pseudo-first-order rate $k = 0.36 \text{ d}^{-1}$ with $t_{1/2} = 1.93 \text{ d}$ in agitated aqueous suspension, and $k = 0.40 \text{ d}^{-1}$ with $t_{1/2} = 1.70 \text{ d}$ at 30°C in garden soil. For anaerobic degradation, first order rate $k = 0.25\text{--}0.696 \text{ d}^{-1}$ with $t_{1/2} = 2.8\text{--}1.0 \text{ d}$ in digester sludge, batch incubation; $k = 0.033 \text{ d}^{-1}$ with $t_{1/2} = 21 \text{ d}$ in flood soil (Peterson & Staples 2003)

Biotransformation: estimated rate constant $k \sim 5.2 \times 10^{-6} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacterial transformation in water (Wolfe et al. 1980a; quoted, Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

depuration $t_{1/2} = 24\text{--}48 \text{ h}$ from bluegill sunfish (Barrows et al. 1980).

$k_2 = 27.7 \text{ d}^{-1}$ (10°C , 0.1 kg staghorn sculpin, lipid content 5%, Gobas et al. 2003)

$k_2 = 2.37 \text{ d}^{-1}$ (10°C , 3 kg dogfish, lipid content 15%, Gobas et al. 2003)

Half-Lives in the Environment:

Air: atmospheric $t_{1/2} = 23.8 \text{ h}$ for reaction with hydroxyl radicals (Howard 1989);

$t_{1/2} = 112\text{--}1118 \text{ h}$, based on estimated rate data for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be 1 to 5 d (Kelly et al. 1994).

$t_{1/2} = 14.41 \text{ d}$ based on photooxidation reaction rate with OH radical, indirect photolysis $t_{1/2} = 14.4 \text{ d}$ (Peterson & Staples 2003)

Surface water: estimated $t_{1/2} < 0.3 \text{ d}$ in river waters (Zoeteman et al. 1980);

mineralization $t_{1/2} \sim 7 \text{ d}$ in municipal digested sludge (Horowitz et al. 1982);

biodegradation $t_{1/2} = 1.90 \text{ d}$ in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984);

$t_{1/2} < 192\text{--}264 \text{ h}$ by biodegradation in fresh river water, $t_{1/2} = 12 \text{ h}$ in Rhine River, an estimated $t_{1/2} \sim 13\text{--}27 \text{ h}$ in a modelling study of simulated ecosystem; abiotic degradation $t_{1/2} = 12.7 \text{ h}$ in pure water and $t_{1/2} = 2.8 \text{ h}$ in the presence of nitrogen dioxide when irradiated with a UV lamp (Howard 1989);

overall degradation $t_{1/2} = 24\text{--}168 \text{ h}$, based on unacclimated river die-away test data (Howard et al. 1991)

Biodegradation $t_{1/2}(\text{aerobic}) = 1 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 4 \text{ d}$ in natural waters (Capel & Larson 1995)

$k(\text{exptl}) = (0.20 \pm 0.10) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and $21\text{--}1^\circ\text{C}$, with $t_{1/2} = 1.9 \text{ d}$ at pH 7 (Yao & Haag 1991)

Biodegradation $t_{1/2}(\text{aerobic}) = 1 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 4 \text{ d}$ and $t_{1/2} = 1200$ at pH 7, $t_{1/2} = 0.026 \text{ d}$ at pH 12 in natural waters (Capel & Larson 1995)

$t_{1/2} = 0.5\text{--}1.39 \text{ d}$ for biodegradation in aerobic aquatic environments (Peterson & Staples 2003)

Ground water: $t_{1/2} = 48\text{--}336 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: biodegradation $t_{1/2} < 5 \text{ d}$ (aerobic) and $t_{1/2} \sim 20 \text{ d}$ (anaerobic) in a garden soil (Shanker et al. 1985);

$t_{1/2} = 10\text{--}50 \text{ d}$, via volatilization subject to plant uptake from soil (Ryan et al. 1988);

$t_{1/2} = 24\text{--}168 \text{ h}$, based on unacclimated aerobic river die-away test data and acclimated aerobic soil grab sample data (Howard et al. 1991)

Biodegradation in aerobic soil: $t_{1/2} = 1.93 \text{ d}$ in agitated aqueous suspension and $t_{1/2} = 1.70 \text{ d}$ in garden soil (Peterson & Staples 2003)

Biota: $24 < t_{1/2} < 48 \text{ h}$ depuration half-life in tissues of bluegill sunfish in 21 d-exposure experiment (Barrows et al. 1980; quoted, Howard 1989);

$t_{1/2} = 23.9 \text{ h}$ for microbial degradation by anaerobic sludge (Wang et al. 2000).

TABLE 15.1.3.1.1

Reported vapor pressures of dimethyl phthalate at various temperatures and the coefficients for the vapor pressure equations

$$\begin{aligned}\log P &= A - B/(T/K) & (1) & \quad \ln P = A - B/(T/K) & (1a) \\ \log P &= A - B/(C + t/^{\circ}\text{C}) & (2) & \quad \ln P = A - B/(C + t/^{\circ}\text{C}) & (2a) \\ \log P &= A - B/(C + T/K) & (3) & \\ \log P &= A - B/(T/K) - C \cdot \log (T/K) & (4) & \end{aligned}$$

FIGURE 15.1.3.1.1 Logarithm of vapor pressure versus reciprocal temperature for dimethyl phthalate.

15.1.3.2 Diethyl phthalate (DEP)

Common Name: Diethyl phthalate

Synonym: DEP, ethyl phthalate

Chemical Name: phthalic acid diethyl ester, ethyl phthalate, 1,2-benzenedicarboxylic acid ethyl ester

CAS Registry No: 84-66-2

Molecular Formula: $C_{12}H_{14}O_4$, $C_6H_4(COOC_2H_5)_2$

Molecular Weight: 222.237

Melting Point ($^{\circ}C$):

−40.5 (Patty 1963; Fishbein & Albro 1972; Lide 2003)

Boiling Point ($^{\circ}C$):

295 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.123 ($25^{\circ}C$, Fishbein & Albro 1972)

1.1175 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

198.9 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

254.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

82.42 (Small et al. 1948)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$) F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

598 (Deno & Berkheimer 1960)

1000 ($20^{\circ}C$, Fishbein & Albro 1972)

1000 ($32^{\circ}C$, from Monsanto Chemical Co. data sheets, Peakall 1975)

896 (shake flask-GC, Wolfe et al. 1980b)

1200* ($20^{\circ}C$, elution chromatography, UV, Schwarz & Miller 1980)

7028 (shake flask-LSC, Veith et al. 1980)

928 ($20^{\circ}C$, shake flask-UV, Leyder & Boulanger 1983)

1080 (shake flask-HPLC/UV, Howard et al. 1985)

680 (measured, Russell & McDuffie 1986)

938* (shake flask-surface tension measurement, measured range 10 – $35^{\circ}C$ Thomsen et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.467* (extrapolated-regression of tabulated data, temp range 108.8 – $294^{\circ}C$, Stull 1947)

0.086 (effusion method, extrapolated-Antoine eq., Small et al. 1948)

$\log(P/mmHg) = 11.26 - 4308/(T/K)$; temp range 32 – $60^{\circ}C$ or pressure range 5×10^{-2} to 10^{-4} mmHg (effusion method, data presented in graph and Antoine eq., Small et al. 1948)

0.052 ($20^{\circ}C$, torsion-effusion method, Balson 1958)

0.0195 ($20^{\circ}C$, aerosol saturation, measured range 25 – $70^{\circ}C$, Frostling 1970)

$\log(P/mmHg) = 11.13 - 4275/(T/K)$; temp range 25 – $70^{\circ}C$ (aerosol saturation, Frostling 1970)

0.467 (calculated-Antoine eq., Weast 1972–73)

$\log(P/mmHg) = [-0.2185 \times 15383.0/(T/K)] + 8.18275$; temp range 108.8 – $294^{\circ}C$ (Antoine eq., Weast 1972–73)

- 0.046* (20°C, extrapolated, gas-saturation method, measured range 34.2–60.5°C, Grayson & Fosbraey 1982)
 $\ln(P/\text{Pa}) = 32.50 - 10436/(T/\text{K})$; temp range 34.2–60.5°C (Antoine eq., gas saturation-GC, Grayson & Fosbraey 1982)
- 1.867 (gas saturation, measured range 60–120°C. Potin-Gautier et al. 1982)
 $\log(P/\text{mmHg}) = 8.806 - 1443.039/(T/\text{K})$; temp range 60–120°C (Potin-Gautier et al. 1982)
- 0.220 (gas saturation-HPLC/UV, Howard et al. 1985)
- 0.0064 (extrapolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.04308 - 1866.05/(-115.9 + T/\text{K})$; temp range 345–453 K (Antoine eq.-I, Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 10.6902 - 6768.3/(-209.45 + T/\text{K})$; temp range 421–570 K (Antoine eq.-II, Stephenson & Malanowski 1987)
- 0.280 (GC-RT correlation, Hinckley et al. 1990)
 $\log(P/\text{mmHg}) = 72.1438 - 7.0747 \times 10^3/(T/\text{K}) - 21.029 \cdot \log(T/\text{K}) - 3.2404 \times 10^{-10} \cdot (T/\text{K}) + 3.4691 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 269–757 K (vapor pressure eq., Yaws et al. 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

- 0.0020 (calculated-P/C, Wolfe et al. 1980a)
- 0.0486 (Lyman et al. 1982; quoted, Howard 1989)
- 0.1220 (calculated-P/C, Mabey et al. 1982)
- 4.7100 (quoted from WERL Treatability Data, Ryan et al. 1988)
- 0.0269 (selected, Staples et al. 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 3.22 (calculated as per Leo et al. 1971)
- 3.15 (RP-HPLC-RT correlation, Veith et al. 1979)
- 1.40 (shake flask-LSC, Veith et al. 1980)
- 2.67 (RP-HPLC-RT correlation, Veith et al. 1980)
- 2.21 (HPLC-RT correlation, McDuffie 1981)
- 2.70 (quoted from Veith et al. 1980, Veith & Kosian 1983; Davies & Dobbs 1984; Saito et al. 1992)
- 2.35 (20°C, shake flask-UV, Leyder & Boulanger 1983)
- 2.24, 2.29 (shake flask-HPLC/UV, HPLC-RT correlation, Howard et al. 1985)
- 2.47 (shake flask, unpublished data, Hansch & Leo 1985; 1987)
- 3.00 (RP-HPLC-RT correlation, De Koch & Lord 1987)
- 2.47 (recommended, Sangster 1993)
- 2.47 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 7.55 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log \text{BCF}$:

- 0.49–1.56 (calculated- K_{OW} , Veith et al. 1979, 1980)
- 2.07 (bluegill sunfish, Veith et al. 1980; Barrows et al. 1980; Veith & Kosian 1983)
- 1.86 (bacteria, calculated- K_{OW} , Wolfe et al. 1980a)
- 1.08, 1.64 (calculated-S, calculated- K_{OW} , Lyman et al. 1982)
- 2.04 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
- 1.19 (mullet, Shimada et al. 1983)
- 2.10 (Davies & Dobbs 1984)
- 2.07 (fish, highest fish BCF, Matthiessen et al. 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.65 (calculated- K_{OW} , Wolfe et al. 1980a)
- 2.72 (soil, calculated-S, Lyman et al. 1982; quoted, Howard 1989)
- 1.97 (soil, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1989)
- 2.15 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

1.34	(sediment, calculated- K_{ow} , Pavlou & Weston 1983, 1984)
1.84	(Broome County of New York soil, shake flask-GC, Russell & McDuffie 1986)
3.00, 2.85, 3.24	(sediment, Alfisol soil, Podzol soil, von Oepen et al. 1991)
2.03	(activated carbon, calculated-MCI χ , Blum et al. 1994)
1.99	(calculated- K_{ow} , Kollig 1993)
1.84	(quoted or calculated-QSAR MCI $^1\chi$, Sabljic et al. 1995)
1.84	(sediment/soil, selected, Staples et al. 1997)
4.90	(suspended solids, calculated- K_d assuming a 0.10 organic carbon fraction, Staples et al. 1997)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: direct $k_p = 2 \times 10^{-4} \text{ h}^{-1}$ (EXAMS model, Wolfe et al. 1980a)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k(aq.) = 18 \text{ M s}^{-1}$ in aquatic environment (Wolfe et al. 1980a)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 1.4 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982)

$k_{OH} = 1.08 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ corresponding to $t_{1/2} = 22.2 \text{ h}$ and the alkyl peroxy reaction $t_{1/2}(\text{calc}) = 6.5 \text{ yr}$ (Howard 1989)

photooxidation $t_{1/2} = 21\text{--}212 \text{ h}$ in air, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991)

photooxidation $t_{1/2} = 2.4\text{--}12.2 \text{ yr}$ in water, based on estimated rate data for the reaction with alkyloxyl radical in aqueous solution (Howard et al. 1991)

$k(aq.) = (0.14 \pm 0.05) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C, with $t_{1/2} = 2.8 \text{ d}$ at pH 7 (Yao & Haag 1991).

$k_{OH}(aq.) = 4 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with OH radical in aqueous solution (Haag & Yao 1992)

predicted atmospheric photooxidation $t_{1/2} = 1.8\text{--}18 \text{ d}$ from Atkinson 1988 atmospheric-oxidation program (Staples et al. 1997)

$k_{OH} = 3.466 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 2.39 \text{ d}$ based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Hydrolysis: $k(\text{acid-catalyzed}) = 0.04 \text{ M}^{-1} \text{ h}^{-1}$, $k(\text{alkaline}) = 79 \text{ M}^{-1} \text{ h}^{-1}$; phthalates are susceptible to alkaline hydrolysis, with theoretical $t_{1/2} = 4$ months to 100 yr at pH 8 and 30°C (Wolfe et al. 1980a)

$k(\text{second-order alkaline}) = 2.5 \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$ at 30°C (Wolfe et al. 1980b; quoted, Kollig 1993)

$k(\text{alkaline}) = 2.5 \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$ at 30°C and $k(\text{second-order alkaline rate}) = 1.2 \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$ at pH 10–12 at 30°C, with a calculated $t_{1/2} = 18.3 \text{ yr}$ at pH 7 (Callahan et al. 1979)

First order hydrolysis $t_{1/2} = 8.8 \text{ yr}$ based on base rate constant at 30°C and pH 7; base rate constant $k = 90 \text{ M}^{-1} \text{ s}^{-1}$ with $t_{1/2} = 32 \text{ d}$ based on measured rate constant at 30°C and pH from 10 to 12 (Howard et al. 1991)

$t_{1/2} = 3200 \text{ d}$, $t_{1/2} = 0.032 \text{ d}$ in natural waters (Capel & Larson 1995)

first-order hydrolysis $t_{1/2} = 8.8 \text{ yr}$ at pH 7 and $t_{1/2} = 32 \text{ d}$ at pH 10–12 based on base rate constant at 30°C (Howard et al. 1991; selected, Staples et al. 1997)

Biodegradation: microbial degradation $t_{1/2} = 10.5 \text{ d}$ by microorganisms isolated from soil and waste water at 30°C (Kurane et al. 1977, quoted, Russell et al. 1985);

estimated rate constant $k \sim (6.59 \pm 0.43) \times 10^2 \text{ min}^{-1}$ from retention times of reverse phase chromatography (Urushigawa & Yonezawa 1979; quoted, O'Grady et al. 1985);

microbial degradation $k = 2 \times 10^{-4} \text{ h}^{-1}$ in an aquatic environment (Wolfe et al. 1980a);

0 to 32% mineralization in > 8 wk in municipal digested sludge (Horowitz et al. 1982);

complete degradation in 7.0 d for 5 and 10 ppm DEP in domestic waste water under aerobic conditions at 25°C (Tabak et al. 1981; quoted, Howard 1989);

$k = 0.315 \text{ d}^{-1}$ corresponding to $t_{1/2} = 2.21 \text{ d}$ with a mixed microbial population and underwent > 99% degradation in 28-d in shake flask biodegradation experiment (Sugatt et al. 1984);

greater than 90% of DEP was degraded within 40 d in digested sludge (Shelton et al. 1984); 85% biodegraded after 14 d incubation in aerobic freshwater sediments at 22°C (Johnson et al. 1984);

biodegraded in excess of 90% in less than 24 h in activated sludge systems (O'Grady et al. 1985);

soil-water biodegradation studies showed the 86% loss after 120 h in Broome County soils and 67% loss in leachate sprayed soil after 48 h (Russell et al. 1985);

anaerobic digestion of sludge with first-order $k = 6.0 \times 10^{-3} \text{ h}^{-1}$ and $t_{1/2} = 115 \text{ h}$ (Ziogou et al. 1989)

aqueous aerobic $t_{1/2} = 72\text{--}1344 \text{ h}$, based on aerobic aqueous grab sample data for fresh and marine water (Howard et al. 1991); aqueous anaerobic $t_{1/2} = 672\text{--}5376 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life and anaerobic screening test data (Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 3 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 28 \text{ d}$ in natural waters (Capel & Larson 1995)

Aerobic biodegradation in aquatic environments, first order $k = 1.8 \text{ d}^{-1}$ with $t_{1/2} = 0.39 \text{ d}$ in river water, $k = 0.16 \text{ d}^{-1}$ with $t_{1/2} = 4.33 \text{ d}$ in MITI inoculum, and $k = 0.98 \text{ d}^{-1}$ with $t_{1/2} = 0.71 \text{ d}$ (Peterson & Staples 2003)

biodegradation in aerobic soil, pseudo-first-order $k = 0.38 \text{ d}^{-1}$ with $t_{1/2} = 1.83 \text{ d}$ in agitated aqueous suspension.

For anaerobic degradation, first order rate $k = 0.069$ to $> 0.3 \text{ d}^{-1}$ with $t_{1/2} = 10.0$ to $< 2.3 \text{ d}$ in digester sludge, batch incubation; $k = 0.036 \text{ d}^{-1}$ with $t_{1/2} = 19.3 \text{ d}$ in flood soil; $k = 0.27 \text{ d}^{-1}$ with $t_{1/2} = 2.6 \text{ d}$ in pond sediment, $k = 0.13 \text{ d}^{-1}$ with $t_{1/2} = 5.3 \text{ d}$ in 10% freshwater sediment and $k = 0.31 \text{ d}^{-1}$ with $t_{1/2} = 2.2 \text{ d}$ in 10% salt marsh sediment (Peterson & Staples 2003)

Biotransformation: experimentally determined microbial $k = 3.2 \times 10^{-9} \text{ mL organism}^{-1} \text{ h}^{-1}$ (Wolfe et al. 1980a,c); estimated $k \sim 1 \times 10^{-7} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacterial transformation in water (Mabey et al. 1982);

mean microbial $k = (7.2 \pm 15.4) \times 10^{-7} \text{ mL cell}^{-1} \text{ h}^{-1}$ for 54 batch aufwuchs cultures (Lewis & Holm 1981; Lewis et al. 1984).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

depuration half-life $24 \text{ h} < t_{1/2} < 48 \text{ h}$ in tissues of bluegill sunfish (Barrows et al. 1980).

$k_2 = 6.83 \text{ d}^{-1}$ (10°C , 0.1 kg staghorn sculpin, lipid content 5%, Gobas et al. 2003)

$k_2 = 0.584 \text{ d}^{-1}$ (10°C , 3 kg dogfish, lipid content 15%, Gobas et al. 2003)

Half-Lives in the Environment:

Air: an estimated $t_{1/2} = 22.2 \text{ h}$ for the vapor reaction with photochemically generated $8 \times 10^5 \text{ molecules}\cdot\text{cm}^{-3}$ OH radical in air at 25°C with an estimated $k \sim 1.08 \times 10^{-11} \text{ cm}^3\cdot\text{molecule}^{-1}\cdot\text{s}^{-1}$ (Howard 1989);

$t_{1/2} = 21\text{--}212 \text{ h}$, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991)

photodegradation $t_{1/2} = 2.39 \text{ d}$ based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Surface water: biodegradation $t_{1/2} = 2.21 \text{ d}$ in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984); $t_{1/2} \sim 2 \text{ d}$ to $> 2 \text{ wk}$ for aerobic biodegradation in water; $t_{1/2} = 3 \text{ d}$ when incubated in dirty river water (Howard 1989);

overall degradation $t_{1/2} = 72\text{--}1344 \text{ h}$, based on aerobic aqueous grab sample data for fresh and marine water (Howard et al. 1991);

$k(\text{exptl}) = (0.14 \pm 0.5) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C , with $t_{1/2} = 2.8 \text{ d}$ at pH 7 (Yao & Haag 1991).

Ground water: $t_{1/2} = 144\text{--}2688 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment: $t_{1/2} < 14 \text{ d}$ in freshwater sediment (Johnson et al. 1984).

Soil: degradation $t_{1/2} = 10.5 \text{ d}$ by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977);

$t_{1/2} = 10\text{--}50 \text{ d}$ via volatilization subject to plant uptake from soil (Ryan et al. 1988);

$t_{1/2} = 72\text{--}1344 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota: $24 \text{ h} < t_{1/2} < 48 \text{ h}$ in tissues of bluegill sunfish (Barrows et al. 1980).

TABLE 15.1.3.2.1
Reported vapor pressures and aqueous solubilities of diethyl phthalate at various pressures and solubilities

Aqueous solubility				Vapor pressure			
Schwarz & Miller 1980		Thomsen et al. 2001		Stull 1947		Grayson & Fosbraey 1982

FIGURE 15.1.3.2.2 Logarithm of vapor pressure versus reciprocal temperature for diethyl phthalate.

15.1.3.3 Diallyl phthalate (DAP)

Common Name: Diallyl phthalate

Synonym: DAP

Chemical Name: di(2-propenyl) phthalate, bis(2-propenyl)ester, 1,2-benzenedicarboxylic acid

CAS Registry No: 131-17-9

Molecular Formula: $C_{14}H_{14}O_4$, $C_6H_4-1,2-(CO_2CH_2CH=CH_2)_2$

Molecular Weight: 246.259

Melting Point ($^{\circ}C$):

-77 (Fishbein & Albro 1972)

Boiling Point ($^{\circ}C$):

290 (Fishbein & Albro 1972)

Density (g/cm^3 at $20^{\circ}C$):

1.121 (Fishbein & Albro 1972)

Molar Volume (cm^3/mol):

219.7 ($20^{\circ}C$, calculated-density)

288.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

< 100 (Fishbein & Albro 1972)

182 ($20^{\circ}C$, shake flask-GC, Leyder & Boulanger 1983)

182; 43, 100 (recommended; calculated-QSAR, Staples 1997)

94 (calculated-UNIFAC, Thomsen et al. 1999)

156 (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0213; 0.00493, 0.155 (recommended; calculated-QSAR, Staples et al. 1997)

0.0271 (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.0289 (selected, Staples et al. 1997)

0.0428 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.23 (shake flask, Leyder & Boulanger 1983)

3.23 (recommended value, Sangster 1993)

3.23 (recommended, Hansch et al. 1995)

3.23; 3.37, 3.63 (recommended; calculated-QSAR, Staples 1997)

3.61 (calculated-UNIFAC, Thomsen et al. 1999)

3.11 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.87 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} = 0.04\text{--}0.4$ d (Staples et al. 1997).

Hydrolysis:

Biodegradation: degradation $t_{1/2} = 2.0$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at 30°C (Kurane et al. 1977).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} = 0.04\text{--}0.4$ d (Staples et al. 1997).

Surface water:

Groundwater:

Sediment:

Soil: degradation $t_{1/2} = 2.0$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at 30°C (Kurane et al. 1977).

Biota:

15.1.3.4 Di-*n*-propyl phthalate (DnPP)

Common Name: Di-*n*-propyl phthalate

Synonym: DPP, DNPP, dipropyl phthalate

Chemical Name: phthalic acid dipropyl ester; 1,2-benzenedicarboxylic acid dipropyl ester

CAS Registry No: 131-16-8

Molecular Formula: C₁₄H₁₈O₄, C₆H₄[COOCH₂CH₂CH₃]₂

Molecular Weight: 250.291

Melting Point (°C):

−31.0 (Lide 2003)

Boiling Point (°C):

304.5 (Lide 2003)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

232.2 (20°C, calculated-density, Stephenson & Malanowski 1987)

302.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

88.70 (Small et al. 1948)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

108 (shake flask-UV, Leyder & Boulanger 1983)

108; 38, 47 (recommended; calculated-structure activity program, QSAR, Staples et al. 1997)

77 (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

0.0175 (effusion method, extrapolated-Antoine eq., Small et al. 1948)

log (P/mmHg) = 11.66 − 4634/(T/K); temp range 32–75°C or pressure range 5 × 10^{−2} to 10^{−4} mmHg (Antoine eq., effusion method, Small et al. 1948). Additional data at other temperatures designated * are compiled at the end of this section

log (P/kPa) = 8.625 − 3824/(T/K); temp range 403–578 K (Antoine eq., Stephenson & Malanowski 1987)

0.0119, 0.138 (calculated-QSAR, Staples et al. 1997)

0.0175 (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant (Pa·m³/mol at 25°C):

0.0309 (recommended, Staples et al. 1997)

0.0569 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, log K_{ow}:

3.27 (shake flask, Leyder & Boulanger 1983)

4.05 (HPLC-RT correlation, Hayward et al. 1990)

4.20 (HPLC-RT correlation, Jenke et al. 1990)

3.27, 4.05 (lit. values, Hansch et al. 1995)

3.27; 3.57, 3.63 (recommended; calculated-structure activity program, QSAR, Staples et al. 1997)

3.636 (Thomsen & Carlsen 1998)

3.40 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.04 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} = 0.9\text{--}9.0$ d (calculated, Staples et al. 1997).

Hydrolysis:

Biodegradation: degradation $t_{1/2} = 6.5$ d by microorganisms (*Pseudomonas acidovorans* 256-1) from soil or waste water at 30°C (Kurane et al. 1977);

rate constant $k = (10.71 \pm 0.73) \times 10^{-2} \text{ min}^{-1}$ was estimated from the retention time in reverse phase chromatography (Urushigawa & Yonezawa 1979).

Aerobic biodegradation in aquatic environments, first order $k = 1.3 \text{ d}^{-1}$ with $t_{1/2} = 0.53$ d in river water (Peterson & Staples 2003)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} = 0.9\text{--}9.0$ d (calculated, Staples et al. 1997).

Surface water: $t_{1/2} = 0.53$ d in river water (Peterson & Staples 2003)

Groundwater:

Sediment:

Soil: degradation $t_{1/2} = 6.5$ d by microorganisms (*Pseudomonas acidovorans* 256-1) from soil or waste water at 30°C (Kurane et al. 1977).

Biota:

FIGURE 15.1.3.4.1 Logarithm of vapor pressure versus reciprocal temperature for di-*n*-propyl phthalate.

15.1.3.5 Di-isopropyl phthalate (DIPP)

Common Name: Di-isopropyl phthalate

Synonym: DIPP

Chemical Name: phthalic acid dipropyl ester, bis(1-methylethyl)ester, 1,2-benzenedicarboxylic acid diisopropyl ester

CAS Registry No: 605-45-8

Molecular Formula: $C_{14}H_{18}O_4$, 1,2- $C_6H_4(CO_2C_3H_7)_2$

Molecular Weight: 250.291

Melting Point ($^{\circ}C$): liquid

Boiling Point ($^{\circ}C$):

304–305 (Weast 1982–83)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

302.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

322 (shake flask-UV, Leyder & Boulanger 1983)

136 (calculated-UNIFAC, Thomsen et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.83 (shake flask-UV, Leyder & Boulanger 1983)

2.83 (recommended, Sangster 1993)

2.83 (recommended, Hansch et al. 1995)

3.59 (calculated-UNIFAC, Thomsen et al. 1999)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Biodegradation: degradation $t_{1/2} = 1.5$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at $30^{\circ}C$ (Kurane et al. 1977).

Half-Lives in the Environment:

Soil: degradation $t_{1/2} = 1.5$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at $30^{\circ}C$ (Kurane et al. 1977).

15.1.3.6 Di-*n*-butyl phthalate (DBP)

Common Name: Dibutyl phthalate

Synonym: *n*-butyl phthalate, di-*n*-butyl phthalate, DBP, dibutyl *o*-phthalate, *o*-benzenedicarboxylic acid dibutyl ester, benzene-*o*-dicarboxylic acid dibutyl ester

Chemical Name: phthalic acid dibutyl ester, di-*n*-butyl phthalate

CAS Registry No: 84-74-2

Molecular Formula: $C_{16}H_{22}O_4$, $o-C_6H_4(COOC_4H_9)_2$

Molecular Weight: 278.344

Melting Point ($^{\circ}C$):

-35.0 (Fishbein & Albro 1972; Verschueren 1977, 1983; Dean 1985; Howard 1989; Lide 2003)

Boiling Point ($^{\circ}C$):

340.0 (Stull 1947; Fishbein & Albro 1972; Weast 1982-83; Verschueren 1983; Dean 1985; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0465 (21 $^{\circ}C$, Fishbein & Albro 1972)

1.047 (Weast 1982-83)

Molar Volume (cm^3/mol):

267.1 (calculated-density, Stephenson & Malanowski 1987)

347.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

93.3 (Small et al. 1948)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K) F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

11.08 (Deno & Berkheimer 1960)

4500 (Patty 1967)

4500 (Fishbein & Albro 1972)

10.0 (30 $^{\circ}C$, from Monsanto Chemical Co. data sheets, Peakall 1975)

13.0 (Wolfe et al. 1979; Wolfe et al. 1980a)

10.8, 11.1, 10.5 (20 $^{\circ}C$: quoted average, elution chromatography, UV, Schwarz & Miller 1980)

11.4, 11.5, 11.2 (30 $^{\circ}C$: quoted average, elution chromatography, UV, Schwarz & Miller 1980)

13 ± 1.6 , 4.45 (shake flask-GC, quoted, Wolfe et al. 1980b; quoted, Staples et al. 1997)

3.25 (solubility in 35 liter instant ocean, Giam et al. 1980)

10.1 (20 $^{\circ}C$, shake flask-UV, Leyder & Boulanger 1983)

 4.72 (recommended, Sangster 1993)
 4.72 (recommended, Hansch et al. 1993)
 4.01 (shake flask-dialysis tubing-HPLC/UV, both phases, Andersson & Schröder 1999)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

- 8.54 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log \text{BCF}$:

- 3.15 (fish, Mayer & Sanders 1973)
 3.82, 3.70, 3.83, 3.28, 3.70, 3.43 (midge larvae, waterflea, scud, mayfly, grass shrimp, damselfly, Sanders et al. 1973)
 3.83 (fish, Sanders et al. 1973)
 1.32 (calculated, Kenaga 1980)
 3.90 (bacteria, calculated- K_{OW} , Wolfe et al. 1980a)
 1.32–1.62, 0.46–1.49, 1.07 (oyster, shrimp, fish, Wofford et al. 1981)
 1.50, 1.22, 1.07 (American oyster, brown shrimp, sheephead minnow, Wofford et al. 1981)
 4.67 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
 4.36 (*Selenastrum capricornutum*, Casserly et al. 1983)
 1.32 (oyster, quoted from Wofford et al. 1981, Zaroogian et al. 1985)
 3.68, 3.68 (oyster, estimated values, Zaroogian et al. 1985)
 1.08 (fish, highest BCF, Matthiessen et al. 1992)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 2.20 (soil, estimated-S, Kenaga 1980)
 3.81 (soil, estimated-S, Wolfe et al. 1980a)
 2.17 (marine sediment/seawater with 1% organic carbon, Bouwer et al. 1981)
 1.60, 1.30, 0.602 (between montmorillonite, kaolinite, calcium montmorillonite and seawater at concn. of 3–4 ppm, Sullivan et al. 1981)

- 0.301, 0.602, 1.556 (between montmorillonite, kaolinite, calcium montmorillonite and seawater at concn. of 20 ppb, Sullivan et al. 1981)
- 5.23 (sediment-water, calculated- K_{OW} , Mabey et al. 1982).
- 4.17 (sediment/soil, Sullivan et al. 1982; selected, Staples et al. 1997)
- 4.54 (sediment, calculated- K_{OW} , Pavlou & Weston 1983,84)
- 3.14 (Broome County soil in New York, shake flask-GC, Russell & McDuffie 1986)
- 4.37 (calculated- K_{OW} , Kollig 1993)
- 3.14 (quoted or calculated-QSAR MCI $^1\chi$, Sabljic et al. 1995)
- 3.09, 5.20 (suspended solids, calculated- K_d assuming a 0.10 organic carbon fraction, Staples et al. 1997)
- 3.14; 3.76, 2.46, 2.86, 3.09, 3.12, 3.11 (quoted lit.; values obtained from HPLC- k' correlation on different stationary phases, Szabo et al. 1999)

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

- Volatilization: $t_{1/2} = 28$ d from a stirred seawater solution 1.0 m deep (Atlas et al. 1982; quoted, Howard 1989)
 evaporation rate $k = 3.42 \times 10^{-10}$ mol cm^{-2} h^{-1} at 20°C (Gückel et al. 1982);
 $t_{1/2} \sim 47$ d in a river of 1.0 m deep with 1 m/s current and a 3 m/s wind using Henry's law constant while the rate of volatilization being controlled by the diffusion through air (Lyman et al. 1982; quoted, Howard 1989).
- Photolysis: direct photolysis (near surface) rate constant $k \sim 2 \times 10^{-4}$ h^{-1} in natural water (Wolfe et al. 1980a)
 aqueous photolysis rate $k = 0.23$ h^{-1} and $t_{1/2} = 3$ h (Jin et al. 1999, quoted, Peterson & Staples 2003)
 Indirect photolysis $k = 0.29$ d^{-1} with $t_{1/2} = 2.4$ d in air (Peterson & Staples 2003).
- Oxidation:
 $k = 18$ M s^{-1} , the free radical oxidation rate constant (EXAMS model, Wolfe et al. 1980a)
 photooxidation $t_{1/2} = 2.4\text{--}12.2$ yr in water, based on estimated rate data for the reaction with alkyloxyl radical in aqueous solution (Wolfe et al. 1980a; quoted, Howard et al. 1991)
 $k \ll 360$ M $^{-1}$ h^{-1} for singlet oxygen and $k = 1.4$ M $^{-1}$ h^{-1} for peroxy radical (Mabey et al. 1982)
 photooxidation $t_{1/2} = 18.4$ h with reaction with OH radical (Howard 1989)
 photooxidation $t_{1/2} = 7.4\text{--}74$ h in air, based on estimated rate data for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991)
 Atmospheric photooxidation $t_{1/2} = 0.6\text{--}6.0$ d from Atkinson 1988 atmospheric-oxidation program (estimated, Staples et al. 1997).
 $k_{OH} = 9.277 \times 10^{-12}$ cm^3 molecule $^{-1}$ s^{-1} and $t_{1/2} = 0.89$ d based on a global, seasonal and diurnal average OH radical concn of 1×10^6 molecule cm^{-3} in air (Peterson & Staples 2003)

Hydrolysis:

- $k(\text{second-order alkaline}) = 2.2 \times 10^{-2}$ M $^{-1}$ s^{-1} for pH 10–12 at 30°C, with calculated half-life of 10 yr at pH 7 (calculated as per Radding et al. 1977, Callahan et al. 1979)
- $k(\text{acid catalyzed}) = 0.04$ M $^{-1}$ h^{-1} , $k(\text{second order alkaline}) = 38$ M $^{-1}$ h^{-1} in an aquatic environment (Wolfe et al. 1980a)
- $k(\text{second-order alkaline}) = (1.0 \pm 0.05) \times 10^{-2}$ M $^{-1}$ s^{-1} at pH 7 and 30°C, with first-order hydrolysis $t_{1/2} = 10$ yr (Wolfe et al. 1980b; quoted, Kollig 1993);
- $t_{1/2} = 76$ d at pH 9 and $t_{1/2} = 10$ yr at neutral pH (estimated, Howard 1989)
- $t_{1/2} = 10$ yr, based on the overall hydrolysis rate constant (Howard et al. 1991)
- aqueous abiotic $t_{1/2} = 22$ yr (selected, Staples et al. 1997)
- $t_{1/2} = 3700$ d at pH 7, $t_{1/2} = 76$ d at pH 12 in natural waters (Capel & Larson 1995)

Biodegradation:

- $t_{1/2} = 3$ d by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977)
- DBP was rapidly degraded, 3% left after 5 d, but under anaerobic conditions required 30 d for the degradation freshwater hydrosol, under aerobic conditions (Johnson et al. 1979, quoted, Russell et al. 1985)
- a 90% loss in 3 d from river water (Brinkman et al. 1979, quoted, Russell et al. 1985)
- $k = (13.26 \pm 0.73) \times 10^2$ min $^{-1}$ (reversed phase-GC-RT correlation, Urushigawa & Yonezawa 1979; quoted, O'Grady et al. 1985)
- $k = 2.9 \times 10^{-8}$ mL organism $^{-1}$ h^{-1} (Wolfe et al. 1980a);
- $k > 0.5$ d $^{-1}$, significant degradation with rapid adaptation within 7 d in an aerobic environment (Tabak et al. 1981; quoted, Mills et al. 1982);
- $k = 7.4 \times 10^{-7}$ mL cell $^{-1}$ d $^{-1}$ (river die-away test, Scow 1982);

32–85% degraded after 2–3 wk in municipal digested sludge (Horowitz et al. 1982)

decomposed within 80 d under both aerobic and anaerobic conditions when approximately 90% added to soils (Inman et al. 1984)

$k = (0.1\text{--}7.6) \times 10^{-4} \text{ h}^{-1}$ to $(4.9\text{--}36.5) \times 10^{-4} \text{ h}^{-1}$ for water and water/sediment systems (under sterile conditions); and $k = (29.3\text{--}409) \times 10^{-4} \text{ h}^{-1}$ to $(38.2\text{--}456) \times 10^{-4} \text{ h}^{-1}$ for water and water/sediment systems (under active conditions) samples from six estuarine and freshwater sites, actual $t_{1/2} = 1.0\text{--}4.8 \text{ d}$ for active sediment treatment, $t_{1/2} = 1.7\text{--}13.0 \text{ d}$ for active water treatment and $t_{1/2} = 8\text{--}23 \text{ d}$ for sterile sediment (Walker et al. 1984)

$k = 0.050 \text{ d}^{-1}$ and $a_{t_{1/2}} = 15.4 \text{ d}$ in a shake flask biodegradation experiment (Sugatt et al. 1984)

> 90% of DBP was degraded within 40 d in digested sludge (Shelton et al. 1984)

> 90% biodegraded in less than 24 h in activated sludge systems (O'Grady et al. 1985)

81% loss in Broome County soils after 24 h and 70% loss in leachate sprayed soil after 24 h in soil-water biodegradation studies (Russell et al. 1985);

$k = 10.6 \times 10^{-3} \text{ h}^{-1}$ and $t_{1/2} = 65 \text{ h}$, anaerobic digestion of sludge (Ziogou et al. 1989);

$t_{1/2} < 5 \text{ d}$, aerobic conditions, $t_{1/2} = 20 \text{ d}$ under anaerobic conditions in a garden soil (Shanker et al. 1985)

$t_{1/2} = 24\text{--}552 \text{ h}$, aqueous aerobic based on unacclimated aerobic river die-away test and soil grab sample data (Howard et al. 1991);

$t_{1/2} = 48\text{--}552 \text{ h}$, aqueous anaerobic, based on unacclimated anaerobic grab sample data for soil and sediment (Johnson & Lulves 1975; Verschueren 1983; Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 1 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 2 \text{ d}$ in natural waters (Capel & Larson 1995)

$k = 0.0216 \text{ h}^{-1}$ with $t_{1/2} = 32.1 \text{ h}$ for microbial degradation by anaerobic sludge (Wang et al. 2000)

aerobic biodegradation in aquatic environments, first order $k = 0.8 \text{ d}^{-1}$ with $t_{1/2} = 0.87 \text{ d}$ in river water, $k = 0.51$

d^{-1} with $t_{1/2} = 1.56 \text{ d}$ in estuarine and river water, $k = 0.29 \text{ d}^{-1}$ with $t_{1/2} = 2.40 \text{ d}$ in sediment microcosm,

$k = 0.22 \text{ d}^{-1}$ with $t_{1/2} = 3.15 \text{ d}$ in MITI inoculum, $k = 0.14 \text{ d}^{-1}$ with $t_{1/2} = 4.95 \text{ d}$ in river water, low sediment,

and $k = 0.98 \text{ d}^{-1}$ with $t_{1/2} = 0.71 \text{ d}$ river water only (Peterson & Staples 2003)

biodegradation in aerobic soil, pseudo-first-order $k = 1.61 \text{ d}^{-1}$ with $t_{1/2} = 0.43 \text{ d}$ in agitated aqueous suspension,

$k = 0.39 \text{ d}^{-1}$ with $t_{1/2} = 1.8 \text{ d}$ at 30°C garden soil; $k = 0.103 \text{ d}^{-1}$ with $t_{1/2} = 6.7 \text{ d}$ in soil with 2% OC;

$k = 0.044 \text{ d}^{-1}$ with $t_{1/2} = 11.2 \text{ d}$ in soil with 3.3% OC and $k = 0.62 \text{ d}^{-1}$ with $t_{1/2} = 15.8 \text{ d}$ in soil with 1.6%

OC. For anaerobic degradation, first order rate $k = 0.26\text{--}0.581 \text{ d}^{-1}$ with $t_{1/2} = 1.19\text{--}2.7 \text{ d}$ in undiluted

digester sludge, $k = 0.025\text{--}0.073 \text{ d}^{-1}$ with $t_{1/2} = 27.7\text{--}9.5 \text{ d}$ in 10% diluted sludge, batch incubation;

$k = 0.076 \text{ d}^{-1}$ with $t_{1/2} = 9 \text{ d}$ in 10% freshwater sediment and $k = 0.051 \text{ d}^{-1}$ with $t_{1/2} = 13 \text{ d}$ in 10% salt

marsh sediment (Peterson & Staples 2003)

Biotransformation: $k = (1.9\text{--}4.4) \times 10^{-8} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacterial transformation in water (Steen et al. 1979; quoted, Mabey et al. 1982; Steen 1991);

$k = 2.9 \times 10^{-8} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacterial transformation in water (Wolfe et al. 1980a).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or half-Lives:

$t_{1/2} = 3 \text{ d}$ in *Daphnia magna* (Mayer & Sanders 1973).

$k_2 = 0.237 \text{ d}^{-1}$ (10°C , 0.1 kg staghorn sculpin, lipid content 5%, Gobas et al. 2003)

$k_2 = 0.0114 \text{ d}^{-1}$ (10°C , 3 kg dogfish, lipid content 15%, Gobas et al. 2003)

Half-Lives in the Environment:

Air: $t_{1/2} \sim 18 \text{ h}$ for the vapor phase reaction with hydroxyl radicals in air (Howard 1989);

$t_{1/2} = 7.4\text{--}74 \text{ h}$, based on estimated rate data for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991);

atmospheric transformation lifetime was estimated to be $< 1 \text{ d}$ (Kelly et al. 1994).

Photodegradation $t_{1/2} = 0.89 \text{ d}$ based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air and indirect photolysis $t_{1/2} = 2.4 \text{ d}$ (Peterson & Staples 2003)

Surface water: biodegradation $t_{1/2} = 15.4 \text{ d}$ in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984)

$t_{1/2} = 2\text{--}12 \text{ d}$ in water alone (Howard 1989);

$t_{1/2} = 24\text{--}336 \text{ h}$, based on unacclimated aerobic river die-away test and fresh water/sediment grab sample data (Howard et al. 1991)

Biodegradation $t_{1/2}(\text{aerobic}) = 1 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 2 \text{ d}$; hydrolysis $t_{1/2} = 3700 \text{ d}$ at pH 7 and $t_{1/2} = 76 \text{ d}$ at pH 12 in natural waters (Capel & Larson 1995)

biodegradation $t_{1/2} = 0.87\text{--}5.78 \text{ d}$ in aerobic aquatic environments (Peterson & Staples 2003)

Ground water: $t_{1/2} = 48\text{--}552$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment: 97% degradation in 5 d in an aerobic pond water-sediment mixture; $t_{1/2} = 7\text{--}30$ d under anaerobic conditions, $t_{1/2} = 1\text{--}5$ d in sediment-water systems of estuarine and freshwater sites (Howard 1989).

Soil: degradation $t_{1/2} = 3$ d by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977) degradation $t_{1/2} = 11$ to 53 d as affected by soil type, pH, temperature, aeration status and sterilization (Inman et al. 1984);

biodegradation $t_{1/2}(\text{aerobic}) < 5$ d and $t_{1/2}(\text{anaerobic}) \sim 20$ d in a garden soil (Shanker et al. 1985);

$t_{1/2} = 10\text{--}50$ d via volatilization subject to plant uptake from soil (Ryan et al. 1988);

overall $t_{1/2} = 48\text{--}552$ h, based on unacclimated aerobic soil grab sample data (Howard et al. 1991)

Aerobic biodegradation in soil, $t_{1/2}$ ranging from 0.43 to 19.8 d in aqueous suspension, garden soil and soils with different organic carbon contents (Peterson & Staples 2003)

Biota: elimination $t_{1/2} = 3$ d for waterfleas *Daphnia magna* (Mayer & Sanders 1973).

FIGURE 15.1.3.6.1 Logarithm of mole fraction solubility ($\ln x$) versus reciprocal temperature for di-*n*-butyl phthalate.

TABLE 15.1.3.6.1

Reported vapor pressures of di-*n*-butyl phthalate at various temperatures and the coefficients for the vapor pressure equations

$\log P = A - B/(T/K)$	(1)	$\ln P = A - B/(T/K)$	(1a)
$\log P = A - B/(C + t/^\circ\text{C})$	(2)	$\ln P = A - B/(C + t/^\circ\text{C})$	(2a)
$\log P = A - B/(C + T/K)$	(3)		
$\log P = A - B/(T/K) - C \cdot \log(T/K)$	(4)		
$\log P = A - B/(T/K) - C/(T/K)^2$	(5)	$\ln P = A - B/(T/K) - C/(T/K)^2$	(5a)

15.1.3.7 Di-isobutyl phthalate (DIBP)

Common Name: Di-isobutyl phthalate

Synonym: DIBP

Chemical Name: phthalic acid diisobutyl ester, bis(2-methylpropyl)ester, 1,2-benzenedicarboxylic acid

CAS Registry No: 84-69-5

Molecular Formula: $C_{16}H_{22}O_4$

Molecular Weight: 278.344

Melting Point ($^{\circ}C$):

-58 (Staples et al. 1997)

Boiling Point ($^{\circ}C$):

296.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.040 (Fishbein & Albro 1972)

1.049 ($15^{\circ}C$, Weast 1982-83)

Molar Volume (cm^3/mol):

347.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

100 (Fishbein & Albro 1972)

6.20 (shake flask-nephelometry, Hollifield 1979)

20.3 (Leyder & Boulanger 1983)

20.0; 5.1, 9.6 (recommended; calculated-QSAR, Staples et al. 1997)

21.6 (calculated-UNIFAC, Thomsen et al. 1999)

9.90 (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at $25^{\circ}C$):

2.4×10^{-4} , 0.0773 (calculated-QSAR, Staples et al. 1997)

0.00473 (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

0.0185 (recommended, Staples et al. 1997)

0.133 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.11 (shake flask, Leyder & Boulanger 1983)

4.43 (calculated-QSAR, Matthiessen et al. 1992)

4.11 (quoted and recommended, Sangster 1993)

4.11 (recommended, Hansch et al. 1995)

4.11; 4.31, 4.46 (recommended; calculated-QSAR, Staples et al. 1997)

4.46 (calculated-UNIFAC, Thomsen et al. 1999)

4.27 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

3.10 (calculated-QSAR, fish, Matthiessen et al. 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

- 3.14 (calculated-QSAR MCI $^1\chi$, Sabljic et al. 1995)
3.01 (suspended solids, Staples et al. 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} = 0.6\text{--}6.0$ d (calculated, Staples et al. 1997)

$k_{OH} = 9.280 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 0.89$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003).

Hydrolysis:

$k(\text{second-order alkaline}) = (1.4 - 0.2) \times 10^{-3} \text{ M}^{-1} \text{ s}^{-1}$ at 30°C in water (Wolfe et al. 1980b)

Biodegradation: degradation $t_{1/2} = 3.0$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at 30°C (Kurane et al. 1977).

Aerobic biodegradation in aquatic environments, first order $k = 0.8 \text{ d}^{-1}$ with $t_{1/2} = 0.87$ d in river water (Peterson & Staples 2003)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.134 \text{ d}^{-1}$ (10°C , 0.1 kg staghorn sculpin, lipid content 5%, Gobas et al. 2003)

$k_2 = 0.0114 \text{ d}^{-1}$ (10°C , 3 kg dogfish, lipid content 15%, Gobas et al. 2003)

Half-Lives in the Environment:

Air: atmospheric photooxidation half-life of $0.6\text{--}6.0$ d (calculated, Staples et al. 1997).

photodegradation $t_{1/2} = 0.89$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Surface water: biodegradation $t_{1/2} = 0.87$ d in river water (Peterson & Staples 2003)

Groundwater:

Sediment:

Soil: degradation $t_{1/2} = 3.0$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at 30°C (Kurane et al. 1977).

Biota:

15.1.3.8 Dipentyl phthalate (DPP)

Common Name: Dipentyl phthalate

Synonym: DPpP, di-*n*-amyl phthalate

Chemical Name: dipentyl phthalate, phthalic acid diphenyl ester, 1,2-benzenedicarboxylic acid diphenyl ester

CAS Registry No: 131-18-0

Molecular Formula: C₁₈H₂₆O₄

Molecular Weight: 306.397

Melting Point (°C):

< -54.5 (Stephenson & Malanowski 1987)

Boiling Point (°C):

342 (Stephenson & Malanowski 1987)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

299.8 (16°C, Stephenson & Malanowski 1987)

391.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

99.16 (Small et al. 1948)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

0.082 (shake flask-nephelometry, Hollifield 1979)

0.1–0.8 (shake flask-GC, Leyder & Boulanger 1983)

0.522, 1.69 (quoted, calculated-UNIFAC, Thomsen et al. 1999)

1.30 (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

5.68×10^{-4} (effusion method, extrapolated-Antoine eq., Small et al. 1948)

$\log (P/\text{mmHg}) = 12.04 - 5191/(T/K)$; temp range 55–102°C or pressure range 5×10^{-2} to 10^{-4} mmHg (Antoine eq., effusion, data presented in graph, Small et al. 1948) (See figure at the end of this section.)

0.0014 (20°C, extrapolated, tensimeter, measured range 63–111°C, Perry & Weber 1949)

$\log (P/\mu\text{mHg}) = 13.57 - 4560/(T/K)$; temp range 63–111°C (pendulum-tensimeter method, Perry & Weber 1949)

5.68×10^{-4} (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 11.165 - 5191/(T/K)$; temp range 303–500 K (Antoine eq., liquid, Stephenson & Malanowski 1987)

0.00128 (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant (Pa·m³/mol at 25°C):

0.302 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, log K_{ow}:

4.85 (shake flask, Leyder & Boulanger 1983; quoted, Sangster 1993, Hansch et al. 1995)

5.33 (calculated-UNIFAC, Thomsen et al. 1999)

5.12, 5.62 (calculated-QSPR, quoted lit., Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.03 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: degradation $t_{1/2} = 9.0$ d by microorganisms (*Pseudomonas acidovorans* 256-1) from soil or waste water at 30°C (Kurane et al. 1977);

rate constant $k = (9.12 \pm 1.51) \times 10^{-2} \text{ min}^{-1}$ was estimated from the retention time in reverse phase chromatography (Urushigawa & Yonezawa 1979).

aerobic biodegradation in aquatic environments, first order $k = 1.3 \text{ d}^{-1}$ with $t_{1/2} = 5.3$ d in river water (Peterson & Staples 2003)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: biodegradation $t_{1/2} = 5.3$ d in aerobic aquatic environments (Peterson & Staples 2003)

Groundwater:

Sediment:

Soil: degradation $t_{1/2} = 9.0$ d by microorganisms (*Pseudomonas acidovorans* 256-1) from soil or waste water at 30°C (Kurane et al. 1977).

Biota:

FIGURE 15.1.3.8.1 Logarithm of vapor pressure versus reciprocal temperature for dipentyl phthalate.

15.1.3.9 Di-*n*-hexyl phthalate (DHP)

Common Name: Di-*n*-hexyl phthalate

Synonym: DHP, DnH(6)P

Chemical Name: Di-*n*-hexyl phthalate, dihexyl ester, 1,2-benzenedicarboxylic acid

CAS Registry No: 84-75-3, 68515-50-4

Molecular Formula: $C_{20}H_{30}O_4$, $C_6H_4[COOCH_2(CH_2)_4CH_3]_2$

Molecular Weight: 334.450

Melting Point ($^{\circ}C$):

-27.4 (Staples et al. 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

0.990 (Fishbein & Abro 1972)

Molar Volume (cm^3/mol):

227.8 ($20^{\circ}C$, calculated-density)

436.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

102.9 (Small et al. 1948)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

insoluble (Fishbein & Abro 1972)

0.24 (shake flask-HPLC/UV, Howard et al. 1985)

0.05; 0.19, 0.049 (recommended; calculated-QSAR, Staples et al. 1997)

0.046 (shake flask-GC, Ellington 1999)

0.47 (calculated-UNIFAC method, Thomsen et al. 1999)

0.159 (calculated-QSPR, Cousins & Mackay 2000)

0.94, 0.52, 0.38 (10, 25, $35^{\circ}C$, shake flask-surface tension measurement, Thomsen et al. 2001) (See figure at the end of this section.)

0.070 ($20^{\circ}C$, shake flask-GC/MS, Letinski et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P/mmHg) = 11.98 - 5381/(T/K)$; temp range 72 – $112^{\circ}C$ or pressure range 5×10^{-2} to 10^{-4} mmHg (Antoine eq., effusion method, data presented in graph, Small et al. 1948) (See figure at the end of this section.)

667 (at $210^{\circ}C$, Fishbein & Abro 1972)

1.03×10^{-3} (Antoine eq., interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = -1.01167 - 1483.636/(T/K)$; temp range 288 – 303 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 11.105 - 5382/(T/K)$; temp range 343 – 387 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = -9.785 - 4805/(T/K)$; temp range 453 – 533 K (Antoine eq.-III for liquid, Stephenson & Malanowski 1987)

1.90×10^{-3} (gas saturation-GC, Howard et al. 1985)

0.267 (quoted, Giam et al. 1994)

0.67; 2.53×10^{-6} , 1.6×10^{-3} (recommended; calculated-QSAR, Staples et al. 1997)

15.1.3.10 Butyl-2-ethylhexyl phthalate (BOP)

Common Name: Butyl-2-ethylhexyl phthalate

Synonym: BEHP, BOP

Chemical Name: Butyl-2-ethylhexyl phthalate

CAS Registry No: 85-69-8

Molecular Formula: $C_{20}H_{30}O_4$, $(C_4H_9OOC)C_6H_4(COOCH_2CH(C_2H_5)(CH_2)_3CH_3)$

Molecular Weight: 333.450

Melting Point ($^{\circ}C$):

-37 (Staples et al. 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

446.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

< 1.0 (shake flask-HPLC/UV spec., Howard et al. 1985)

0.11; 0.02 (recommended; calculated-QSAR, Staples et al. 1997)

0.075 (calculated-UNIFAC, Thomsen et al. 1999)

0.385 (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at $25^{\circ}C$):

1.47×10^{-5} ; 3.2×10^{-3} , 0.016 (recommended; calculated-QSAR, Staples et al. 1997)

5.37×10^{-4} (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.0405 (recommended, Staples et al. 1997)

0.466 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.93 (av. from OECD, Howard et al. 1985)

3.70–7.88 (calculated-HPLC-RT, Howard et al. 1985)

6.28; 6.5 (recommended, calculated-QSAR, Staples et al. 1997)

6.20 (calculated-UNIFAC, Thomsen & Carlsen 1998)

5.64 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.37 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

6.30 (suspended solids, Staples et al. 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: direct photolysis rate $k_p = 2 \times 10^{-4} \text{ h}^{-1}$ (EXAMS model, Wolfe et al. 1980a)Oxidation: atmospheric photooxidation $t_{1/2} = 0.4\text{--}4.0 \text{ d}$ (calculated, Staples et al. 1997).

Hydrolysis:

 $k(\text{second-order alkaline}) = (1.1 \pm 0.1) \times 10^{-4} \text{ M}^{-1} \text{ s}^{-1}$ for pH 10–12 at 30°C, with $t_{1/2}(\text{calc}) = 2000 \text{ yr}$ at pH 7 (calculated as per Radding et al. 1977, Callahan et al. 1979) $k(\text{acid catalyzed}) = 0.04 \text{ M}^{-1} \text{ h}^{-1}$, $k(\text{second order alkaline}) = 0.4 \text{ M}^{-1} \text{ h}^{-1}$ in an aquatic environment (Wolfe et al. 1980a) $k(\text{second-order alkaline}) = (1.1 \pm 0.1) \times 10^{-4} \text{ M}^{-1} \text{ s}^{-1}$ at 30°C in water with $t_{1/2} = 100\text{--}2000 \text{ yr}$ (Wolfe et al. 1980b)Biodegradation: primary biodegradation rate constant $k = 0.153 \text{ d}^{-1}$ and $t_{1/2} = 4.55 \text{ d}$ in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} = 0.4\text{--}4.0 \text{ d}$ (calculated, Staples et al. 1997).Surface water: hydrolysis $t_{1/2} = 100\text{--}2000 \text{ yr}$ (Wolfe et al. 1980b; Callahan et al. 1979);primary biodegradation rate constant $k = 0.153 \text{ d}^{-1}$ and $t_{1/2} = 4.55 \text{ d}$ in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Groundwater:

Sediment:

Soil:

Biota:

15.1.3.11 Di-*n*-octyl phthalate (DOP)

Common Name: Di-*n*-octyl phthalate

Synonym: di-*n*-octyl phthalate, DOP, *o*-benzenedicarboxylic acid dioctyl ester, *n*-dioctyl phthalate, octyl phthalate, dioctyl-*o*-benzenedicarboxylate

Chemical Name: di-*n*-octyl phthalate

CAS Registry No: 117-84-0

Common Molecular Formula: $C_{24}H_{38}O_4$, $C_6H_4(COOC_8H_{17})_2$

Molecular Weight: 390.557

Melting Point ($^{\circ}C$):

-25.0 (Patty 1963; Fishbein & Albro 1972; Callahan et al. 1979; Mabey et al. 1982; Lide 2003)

Boiling Point ($^{\circ}C$):

220.0 (Patty 1963; Fishbein & Albro 1972; Callahan et al. 1979; Mabey et al. 1982)

Density (g/cm^3 at $20^{\circ}C$):

0.978 (Fishbein & Albro 1972; Ellington 1999)

Molar Volume (cm^3/mol):

399.3 ($20^{\circ}C$, calculated-density)

524.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

50.0	($20^{\circ}C$, Fishbein & Albro 1972)
3.0	(shake flask-GC, Wolfe et al. 1979)
3.0	(shake flask-GC, Wolfe et al. 1980a,b)
0.285	($24^{\circ}C$, tech. grade, Verschueren 1983)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 9.2 (calculated as per Leo et al. 1971, Callahan et al. 1979)
 9.2 (calculated, Wolfe et al. 1979)
 8.06 (HPLC-RT correlation; McDuffie 1981)
 8.92 (calculated-CLOGP for synthesized phthalate, DeFoe et al. 1990)
 5.22 (shake flask, $\log P$ database, Hansch & Leo 1987)
 8.06 (recommended, Staples et al. 1997)
 6.99 (calculated-UNIFAC method, Thomsen et al. 1999)
 7.73 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 10.53 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

- 2.82, 3.97, 0.064, 3.72, 2.64 (in lab. model ecosystem after 3 d: alga, daphnia, mosquito fish, mosquito larvae, snails, Sanborn et al. 1975)
 4.45, 3.41, 3.97, 3.97, 4.13 (in lab. model ecosystem after 33 d: alga, daphnia, mosquito fish, mosquito larvae, snails, Sanborn et al. 1975)
 3.46 (bacteria, calculated- K_{OW} , Wolfe et al. 1980a)
 8.59 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.28 (calculated, Wolfe et al. 1980a)
 9.56 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 7.91 (sediment, calculated- K_{OW} , Pavlou & Weston 1983, 1984)
 7.60 (calculated- K_{OW} , Kollig 1993)
 6.30 (suspended solids, calculated- K_d assuming a 0.1 org. carbon fraction, Staples et al. 1997)

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: direct photolysis rate $k_p = 2 \times 10^{-4} \text{ h}^{-1}$ (EXAMS model, Wolfe et al. 1980a)

Oxidation: $k = 18 \text{ M s}^{-1}$, free radical oxidation rate constant in an aquatic environment (Wolfe et al. 1980a)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 1.4 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982)

photooxidation $t_{1/2} = 4.5\text{--}44.8 \text{ h}$ in air, based on estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991)

photooxidation $t_{1/2} = 0.3\text{--}3.0 \text{ d}$ from Atkinson 1988 atmospheric-oxidation program (Staples et al. 1997)

$k_{OH} = 20.581 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 0.40 \text{ d}$ based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Hydrolysis:

phthalates are susceptible to alkaline hydrolysis, with theoretical $t_{1/2} = 4 \text{ months to } 100 \text{ yr}$ at pH 8 and 30°C (Wolfe et al. 1980a)

$k(\text{acid catalyzed}) = 0.04 \text{ M}^{-1} \text{ h}^{-1}$, $k(\text{second order alkaline}) = 59 \text{ M}^{-1} \text{ h}^{-1}$ in an aquatic environment (Wolfe et al. 1980a)

$k(\text{base}) = 7.4 \text{ M}^{-1} \text{ h}^{-1}$ at pH 7 and 25°C (Ellington et al. 1987)

$t_{1/2} = 107 \text{ yr}$ at pH 7, $t_{1/2} = 1 \text{ yr}$ at pH 9 and 25°C (Howard et al. 1991; selected, Staples et al. 1997).

Biodegradation: the pseudo first-order degradation rate constant $k = 0.14 \text{ d}^{-1}$ corresponding to $t_{1/2} = 5 \text{ d}$ in a model ecosystem (Sanborn et al. 1975);

degradation $t_{1/2} = 8 \text{ d}$ by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977)

rate constant $k \sim (1.57 \pm 0.17) \times 10^2 \text{ min}^{-1}$ from retention times of reverse phase chromatography (estimated, Urushigawa & Yonezawa 1979);

microbial degradation rate constant $k = 2 \times 10^{-4} \text{ h}^{-1}$ in an aquatic environment (Wolfe et al. 1980a)

significant degradation with gradual adaptation from 7 to 21 d in an aerobic environment with a rate $k < 0.5 \text{ d}^{-1}$ (Tabak et al. 1981; quoted, Mills et al. 1982);

biodegradation rate constant $k = 7.4 \times 10^{-9} \text{ mL} \cdot \text{cell}^{-1} \cdot \text{d}^{-1}$ at 30°C in water (Scow 1982);

aqueous aerobic $t_{1/2} = 168\text{--}672 \text{ h}$, based on unacclimated and acclimated aqueous screening test data; aqueous anaerobic $t_{1/2} = 4320\text{--}8760 \text{ h}$, based on acclimated anaerobic screening test data (Howard et al. 1991);

rate constant $k = 0.0014 \text{ h}^{-1}$ with $t_{1/2} = 513.4 \text{ h}$ for microbial degradation by anaerobic sludge (Wang et al. 2000)

aerobic biodegradation in aquatic environments, first order $k = 0.7 \text{ d}^{-1}$ with $t_{1/2} = 1.0 \text{ d}$ in river water (Peterson & Staples 2003)

anaerobic biodegradation, first order rate $k = 0.006\text{--}0.0336 \text{ d}^{-1}$ with $t_{1/2} = 115\text{--}20.6 \text{ d}$ in undiluted digester sludge of different DOP concn, batch incubation (Peterson & Staples 2003)

Biotransformation: $k = 3.1 \times 10^{-10} \text{ mL} \cdot \text{cell}^{-1} \cdot \text{h}^{-1}$ for bacterial transformation in water (Wolfe et al. 1980a);

microbial transformation $k = (3.7 \pm 0.6) \times 10^{-13} \text{ L} \cdot \text{organism}^{-1} \cdot \text{h}^{-1}$ in natural aquatic systems (Steen et al. 1979; quoted, Steen 1991).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_2 = 3.69 \times 10^{-5} \text{ d}^{-1}$ (10°C , 0.1 kg staghorn sculpin, lipid content 5%, Gobas et al. 2003)

$k_2 = 3.16 \times 10^{-6} \text{ d}^{-1}$ (10°C , 3 kg dogfish, lipid content 15%, Gobas et al. 2003)

Half-Lives in the Environment:

Air: $t_{1/2} = 4.5\text{--}44.8 \text{ h}$, based on estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

photodegradation $t_{1/2} = 0.40 \text{ d}$ based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Surface water: degradation $t_{1/2} = 5 \text{ d}$ in an aquatic model ecosystem (Sanborn et al. 1975);

overall degradation $t_{1/2} = 168\text{--}672 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

biodegradation $t_{1/2} = 1.0 \text{ d}$ in aerobic aquatic environments (Peterson & Staples 2003)

Ground water: $t_{1/2} = 336\text{--}8760 \text{ h}$, based on estimated aqueous aerobic and anaerobic biodegradation half-lives (Howard et al. 1991).

Sediment:

Soil: degradation $t_{1/2} = 8 \text{ d}$ by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977)

$t_{1/2} = 10\text{--}50 \text{ d}$ via volatilization subject to plant uptake from the soil (Ryan et al. 1988);

degradation $t_{1/2} = 168\text{--}672 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

15.1.3.12 Di-isooctyl phthalate (DIOP)

Common Name: Di-isooctyl phthalate

Synonym: DIOP

Chemical Name:

CAS Registry No: 27554-26-3

Molecular Formula: $C_{24}H_{38}O_4$

Molecular Weight: 390.557

Melting Point ($^{\circ}C$):

−4 (Fishbein & Albro 1972)

−46 (Staples et al. 1997)

Boiling Point ($^{\circ}C$):

270 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

524.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.09 (shake flask-GC, Howard et al. 1985)

0.001; 0.00024, 0.00081 (recommended; calculated-QSAR, Staples et al. 1997)

2.49×10^{-3} (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.55×10^{-4} (dew-point and tensimeter methods, extrapolated from Clausius-Clapeyron eq., Werner 1952)

$\log(P/\text{micron}) = -4829/(T/K) + 13.262$; temp range 70 – $210^{\circ}C$, (exptl. data fitted to the Clausius-Clapeyron eq., Werner 1952)

7.4×10^{-4} (gas saturation method, Howard et al. 1985)

$\log(P/\text{mmHg}) = 24.8803 - 5.5821 \times 10^3/(T/K) - 1.2116 \cdot \log(T/K) - 1.547 \times 10^{-2} \cdot (T/K) + 6.5101 \times 10^{-6} \cdot (T/K)^2$; temp range 260 – 851 K (vapor pressure eq., Yaw et al. 1994)

1.55×10^{-4} , 7.4×10^{-4} , 4.53×10^{-5} (quoted, Staples et al. 1997)

7.5×10^{-4} ; 1.33×10^{-4} , 2.67×10^{-8} , 1.87×10^{-4} (recommended; calculated-QSAR, Staples 1997)

2.52×10^{-5} (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

3.95 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

8.0; 8.39 (recommended; calculated-QSAR, Staples et al. 1997)

7.73 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.53 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} \sim 0.3\text{--}3.0$ d (Estimated, Staples et al. 1997).

Hydrolysis: aqueous hydrolysis $t_{1/2} \sim 157$ yr (estimated, Staples et al. 1997).

Biodegradation: primary biodegradation rate constant $k = 0.082\text{ d}^{-1}$ and $t_{1/2} = 8.82$ d in an acclimated shake flask
CO₂ evolution test (Sugatt et al. 1984).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} \sim 0.3\text{--}3.0$ d (estimated, Staples et al. 1997).

Surface water: primary biodegradation rate constant $k = 0.082\text{ d}^{-1}$ and $t_{1/2} = 8.82$ d in an acclimated shake flask
CO₂ evolution test (Sugatt et al. 1984);

aqueous hydrolysis $t_{1/2} \sim 157$ yr (estimated, Staples et al. 1997).

 4.34, 6.00 (suspended solids, calculated- K_d assuming a 0.1 org. carbon fraction, Staples et al. 1997)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

- Volatilization: calculated evaporation rate $k = 0.00052$ cm/h corresponding to $t_{1/2} = 132600$ h for a pond of 1 m deep (Branson 1978).
- Photolysis: rate constant for direct photolysis $k = 2 \times 10^{-4}$ h $^{-1}$ in natural water (Wolfe et al. 1980a);
 $t_{1/2} \sim 143$ d in water is estimated to be 143 d (Wolfe et al. 1980a; quoted, Howard 1989);
 atmospheric $t_{1/2} = 3500$ –4800 h and aqueous $t_{1/2} = 3500$ –4800 h, based on measured rate of aqueous photolysis for DMP (Howard 1991).
 Aqueous photolysis $k = 0.9$ h $^{-1}$ and $t_{1/2} = 0.75$ h (Jin et al. 1999, quoted, Peterson & Staples 2003)
- Oxidation: the free radical oxidation rate constant $k = 18$ M \cdot s $^{-1}$ (Wolfe et al. 1980b);
 photooxidation $t_{1/2} = 44$ –584 d in water, based on estimated rate constant for the reaction with hydroxyl radicals in water (Wolfe et al. 1980; quoted, Howard et al. 1991);
 rate constant $k \ll 360$ M $^{-1}$ ·h $^{-1}$ for singlet oxygen and $k = 7.2$ M $^{-1}$ ·h $^{-1}$ for peroxy radical (Mabey et al. 1982);
 photooxidation $t_{1/2} = 2.9$ –29 h in air, based on estimated rate constant for the reaction with hydroxyl radicals in air (Atkinson 1987; quoted, Howard et al. 1991);
 predicted atmospheric photooxidation $t_{1/2} = 0.2$ –2.0 d from Atkinson 1988 atmospheric-oxidation program (Staples et al. 1997).
 $k_{OH} = 21.955 \times 10^{-12}$ cm 3 molecule $^{-1}$ s $^{-1}$ and $t_{1/2} = 0.38$ d based on a global, seasonal and diurnal average OH radical concn of 1×10^6 molecule cm $^{-3}$ in air (Peterson & Staples 2003)
- Hydrolysis: second order alkaline hydrolysis rate constant $k = 1.1 \times 10^{-4}$ M $^{-1}$ ·s $^{-1}$ for pH 10–12 at 30°C in water (Wolfe et al. 1979, 1980b; quoted, Callahan et al. 1979);
 $t_{1/2} = 100$ to 2000 yr for hydrolytic degradation alone in the eutrophic lake ecosystem at steady-state increase (Wolfe et al. 1980a);
 $t_{1/2}(\text{calc}) = 2000$ yr at pH 7 in water (calculated per Radding et al. 1977; quoted, Callahan et al. 1979; Howard 1989; Howard et al. 1991);
 $k(\text{exptl.}) = 9.5 \times 10^{-7}$ d $^{-1}$ at pH 7 and 25°C while estimated rate constant $k = 1.46 \times 10^{-6}$ d $^{-1}$ at pH 7 and 30°C (Neely 1985);
 first-order hydrolysis $t_{1/2} = 2000$ yr at pH 7, based on measured base catalyzed hydrolysis rate constant (Howard et al. 1991; selected, Staples et al. 1997).
- Biodegradation: approximately calculated rate constant $k = 0.091$ d $^{-1}$ in pond water plus sediment incubated under aerobic conditions based on time for 50% degradation (Johnson & Lulves 1975; quoted, Klečka 1985);
 estimated biodegradation $t_{1/2} \sim 4$ –5 wk by naturally occurring, mixed microbial populations in river water (Saeger & Tucker 1976);
 degradation $t_{1/2} = 1.3$ d by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977);
 rate constant $k = 0.023$ d $^{-1}$ in river water incubated under aerobic conditions (Klečka 1985);
 rate constant $k(\text{mineralization rate divided by initial substrate concn.}) = 0.028 \pm 0.013$ d $^{-1}$ in lake water incubated under aerobic conditions (Subba-Rao et al. 1982; quoted, Klečka 1985);
 $t_{1/2} = 2.0$ –3.0 wk, based on river die-away test data (Hattori et al. 1975; Saeger & Tucker 1976; Wolfe et al. 1980; estimated, Howard 1989);
 $t_{1/2} = 0.8$ d in activated sludge (Saeger & Tucker 1976; estimated, Howard 1989);
 microbial degradation rate constant $k = 4.2 \times 10^{-12}$ mL·organism $^{-1}$ ·s $^{-1}$ (Wolfe et al. 1980a);
 significant degradation with gradual adaptation from 7 to 21 d in an aerobic environment with a rate $k < 0.5$ d $^{-1}$ (Tabak et al. 1981; quoted, Mills et al. 1982);
 aqueous aerobic $t_{1/2} = 120$ –550 h, based on grab sample die-away test data (Schouten et al. 1979 and Johnson & Lulves 1975; estimated, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 980$ –9336 h, based on anaerobic

die-away test data (Howard et al. 1991) and anaerobic aqueous screening studies (Horowitz et al. 1982 and Shelton et al. 1984; estimated, Howard et al. 1991);
mean rate constant $k = 0.136 \text{ d}^{-1}$ corresponding to $t_{1/2} = 5.25 \text{ d}$ in shake flask biodegradation experiment (Sugatt et al. 1984);

more than 90% of initial 3.3 mg/L will be degraded in activated sludge systems in 2–5 d (O'Grady et al. 1985);

greater than 50% loss in microbial degradation in less than 20 d under aerobic conditions, very low under anaerobic conditions in garden soil (Shanker et al. 1985);

readily metabolized in uninoculated Erie slit loam with the absence of nonaqueous-phase liquids (NAPLs) for about 20 d (Efroymson & Alexander 1994)

biphasic microbial mineralization kinetics: $k = 0.0044 \text{ d}^{-1}$ with $t_{1/2} = 158 \text{ d}$ at 5°C , $k = 0.0081 \text{ d}^{-1}$ with $t_{1/2} = 86 \text{ d}$ at 10°C , and $k = 0.0134 \text{ d}^{-1}$ with $t_{1/2} = 52 \text{ d}$ at 20°C in agriculture soil for phase I; and $t_{1/2} = 224 \text{ d}$ at 5°C , $t_{1/2} = 187 \text{ d}$ at 10°C and $t_{1/2} = 73 \text{ d}$ at 20°C in agriculture soil for phase II. Rate $k = 0.0023 \text{ d}^{-1}$ with $t_{1/2} = 301 \text{ d}$ at 5°C , $k = 0.0055 \text{ d}^{-1}$ with $t_{1/2} = 125 \text{ d}$ at 10°C , and $k = 0.0127 \text{ d}^{-1}$ with $t_{1/2} = 55 \text{ d}$ at 20°C in sludge-amended soil for phase I and $t_{1/2} \geq 365 \text{ d}$ at 5°C , $t_{1/2} = 337 \text{ d}$ at 10°C and $t_{1/2} = 150 \text{ d}$ at 20°C in sludge-amended soil for phase II kinetics in laboratory microcosms. At 20°C , aerobic mineralization rate $k = 0.0182 \text{ d}^{-1}$ with $t_{1/2} = 37 \text{ d}$ for phase I, $t_{1/2} = 51 \text{ d}$ for phase II in well-mixed sludge, $k = 0.0058 \text{ d}^{-1}$ with $t_{1/2} = 120 \text{ d}$ for phase I, $t_{1/2} \geq 365 \text{ d}$ for phase II in aggregate sludge, aerobic $k = 0.0127 \text{ d}^{-1}$ with $t_{1/2} = 55 \text{ d}$ for phase I, $t_{1/2} = 150 \text{ d}$ for phase II and anaerobic $k = 0.0023 \text{ d}^{-1}$ with $t_{1/2} = 301 \text{ d}$ for phase I, $t_{1/2} \geq 365 \text{ d}$ for phase II in sludge-amended soil (Madsen et al. 1999).

aerobic biodegradation in aquatic environments, first order $k = 0.023 \text{ d}^{-1}$ with $t_{1/2} = 30 \text{ d}$ in unstirred river water, $k = 0.2 \text{ d}^{-1}$ with $t_{1/2} = 3.5 \text{ d}$ in shaken river water, $k = 1.73 \text{ d}^{-1}$ with $t_{1/2} = 0.4 \text{ d}$ field data, estuarine sediment (Peterson & Staples 2003)

aerobic soil degradation, pseudo-first-order $k = 0.035 \text{ d}^{-1}$ with $t_{1/2} = 2.0 \text{ d}$ in loam; $k = 0.010 \text{ d}^{-1}$ with $t_{1/2} = 69.3 \text{ d}$ in sand; $k = 0.033 \text{ d}^{-1}$ with $t_{1/2} = 21 \text{ d}$ in outdoor lysimeter, loam; $k = 0.013 \text{ d}^{-1}$ with $t_{1/2} = 53.3 \text{ d}$ in outdoor lysimeter, sand; $k = 0.12 \text{ d}^{-1}$ with $t_{1/2} = 5.6 \text{ d}$ in garden soil; $k = 0.040 \text{ d}^{-1}$ with $t_{1/2} = 17.3 \text{ d}$ in soil with 2% OC-organic carbon; $k = 0.019 \text{ d}^{-1}$ with $t_{1/2} = 36.5 \text{ d}$ in soil with 3.3% OC; $k = 0.015 \text{ d}^{-1}$ with $t_{1/2} = 46.2 \text{ d}$ in soil with 1.6% OC and $k = 0.012 \text{ d}^{-1}$ with $t_{1/2} = 58 \text{ d}$ in sludge amended loam. For anaerobic degradation, first order rate $k > 0.3 \text{ d}^{-1}$ with $t_{1/2} < 2.3 \text{ d}$ in undiluted digester sludge, batch incubation; $k = 0.013 \text{ d}^{-1}$ with $t_{1/2} = 53.3 \text{ d}$ in flood soil; $k = 0.69 \text{ d}^{-1}$ with $t_{1/2} = 1.0 \text{ d}$ field data, sediment (Peterson & Staples 2003)

Biotransformation: $k = 4.2 \times 10^{-12} \text{ mL} \cdot \text{cell}^{-1} \cdot \text{h}^{-1}$ for bacterial transformation in water (Wolfe et al. 1980a; quoted, Mabey et al. 1982);

microbial transformation $k = (4.2 \pm 0.7) \times 10^{-15} \text{ L} \cdot \text{organism}^{-1} \cdot \text{h}^{-1}$ in natural aquatic systems (Steen et al. 1979; quoted, Steen 1991).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$t_{1/2} = 7 \text{ d}$ for elimination of DEHP from fathead minnows (Mayer & Sanders 1973);

fish elimination $t_{1/2} = 6.2$ to 18.3 d with a mean value of 12.2 d after 56 d exposure period (fathead minnows, Mayer 1976);

$k_1 = 76 \text{ mL g}^{-1} \cdot \text{h}^{-1}$ (fish, Branson 1978);

depuration $t_{1/2} = 72 \text{ h}$ (tissues of bluegill sunfish, Barrows et al. 1980).

$k_2 = 3.69 \times 10^{-5} \text{ d}^{-1}$ (10°C , 0.1 kg staghorn sculpin, lipid content 5%, Gobas et al. 2003)

$k_2 = 3.16 \times 10^{-6} \text{ d}^{-1}$ (10°C , 3 kg dogfish, lipid content 15%, Gobas et al. 2003)

Half-Lives in the Environment:

Air: $t_{1/2}$ = half-life of 2.9–29 h, based on estimated rate constant for the reaction with hydroxyl radicals in air (Howard et al. 1991);

atmospheric transformation lifetime was estimated to be $< 1 \text{ d}$ (Kelly et al. 1994).

Photodegradation $t_{1/2} = 0.38 \text{ d}$ based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Surface water: biodegradation $t_{1/2} \sim 4$ to 5 wk in river water by naturally occurring, mixed microbial populations (Saeger & Tucker 1976);

$t_{1/2} = 5 \text{ d}$ in a model ecosystem (Verschuere 1983);

$t_{1/2} = 5.25 \text{ d}$ in an acclimated shake flask CO_2 evolution biodegradation experiment (Sugatt et al. 1984)

$t_{1/2} = 120$ – 550 h , based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biodegradation $t_{1/2}$ = 0.3–30 d in estuarine river water with sediment and river water (Peterson & Staples 2003)

Ground water: $t_{1/2}$ = 240–9336 h, based on unacclimated aqueous aerobic and anaerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: degradation $t_{1/2}$ = 1.3 d by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977) biodegradation $t_{1/2}$ < 20 d under anaerobic conditions in a garden soil (Shanker et al. 1985);

$t_{1/2}$ = 10–50 d via volatilization subject to plant uptake from the soil (Ryan et al. 1988);

degradation $t_{1/2}$ = 39 d for initial phase, $t_{1/2}$ = 51 d for the late phase in sludge-amended quartz; $t_{1/2}$ = 58 d for initial phase and $t_{1/2}$ = 147 d for sludge-amended soil, $t_{1/2}$ = 58 d for initial phases and $t_{1/2}$ = 84 d in sludge slurry; $t_{1/2}$ = 9 d for initial phases, $t_{1/2}$ = 35 d for late phase in sludge-amended soil + strain SDE-2 (Roslev et al. 1998)

overall $t_{1/2}$ = 120–550 h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

degradation by microorganism in biometer systems, $t_{1/2}$ = 66 d in silty sand standard metabolism experiments, $t_{1/2}$ = 102 d corrected standard conditions, $t_{1/2}$ = 170 d in simulated outdoor conditions; $t_{1/2}$ = 20 d in silty loam standard conditions, $t_{1/2}$ = 30 d corrected standard conditions, $t_{1/2}$ = 31 d in simulated outdoor conditions at constant soil moisture and 20°C; degradation by microorganism in outdoor experiments in small lysimeter systems: $t_{1/2}$ = 54 d outdoor fallow and $t_{1/2}$ = 200 d outdoor barley in silty sand, and $t_{1/2}$ = 21 d outdoor fallow, $t_{1/2}$ = 14 d outdoor barley in silty loam (Rüdel et al. 1993)

microbial mineralization $t_{1/2}$ = 158, 86 and 52 d at 5, 10, and 20°C, respectively, in soil; $t_{1/2}$ = 301, 125 and 55 d at 5, 10 and 20°C in sludge-amended soil in phase I degradation kinetics; $t_{1/2}$ = 224, 187 and 73 d at 5, 10, and 20°C, respectively, in soil; $t_{1/2}$ = 365, 337 and 150 d at 5, 10 and 20°C in sludge-amended soil in phase II degradation kinetics. At 20°C, $t_{1/2}$ varies between 77–89 d and 100–127 d for phase I and II, respectively, in sludge-amended soil with different initial DEHP concns. Aerobic $t_{1/2}$ = 37 d and 51 d for phase I and II in well mixed sludge, $t_{1/2}$ = 120 d and > 365 d for phase I and II in aggregate sludge, $t_{1/2}$ = 55 d and 150 d for phase I and II in sludge-amended soil; anaerobic $t_{1/2}$ = 301 d and > 365 d for phase I and II in sludge-amended soil (laboratory microcosms, Madsen et al. 1999)

biodegradation in aerobic soil: $t_{1/2}$ = 2.0 – 69.3 d in various sand, loam, soils with different organic carbon content and sludge amended loam in laboratory and outdoor experiments (Peterson & Staples 2003)

Biota: elimination and degradation $t_{1/2}$ < 4 d after 7 d for water fleas *Daphnia magna* and $t_{1/2}$ = 7 d for fathead minnows (Mayer & Sanders 1973);

fish elimination $t_{1/2}$ = 12.2 d (fathead minnows *Pimephales promelas*, Mayer 1976);

depuration $t_{1/2}$ = 3 d (in tissues of bluegill sunfish continuously for 42-d exposure, Barrows et al. 1980)

depuration $t_{1/2}$ = 38 d from sheephead minnow (Karara & Hayton 1984).

FIGURE 15.1.3.13.1 Logarithm of vapor pressure versus reciprocal temperature for *bis*(2-ethylhexyl) phthalate.

15.1.3.14 Di(hexyl,octyl,decyl) phthalate

Common Name: Di(hexyl,octyl,decyl) phthalate

Synonym: 610P

Chemical Name:

CAS Registry No: 25724-58-7, 68515-51-5

Molecular Formula: $C_{25}H_{40}O_4$

Molecular Weight: 404.583

Melting Point ($^{\circ}C$):

−4 (Staples et al. 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

547.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.9 ± 0.5 (shake flask, Howard et al. 1985)

0.05; 0.0004 (recommended; calculated-QSAR, Staples et al. 1997)

8.76×10^{-4} (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at $25^{\circ}C$):

6.5×10^{-4} (gas saturation, Howard et al. 1985)

6.5×10^{-4} ; 4.53×10^{-5} , 6.5×10^{-2} (recommended; calculated-QSAR, Staples et al. 1997)

1.31×10^{-5} (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

6.05 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.9–8.61 (HPLC-RT correlation, Howard et al. 1985; quoted, Staples et al. 1997)

7.25; 8.54 (recommended; calculated-QSAR, Staples et al. 1997)

8.17 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.78 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} \sim 0.2$ – 4.0 d (estimated, Staples et al. 1997).

Hydrolysis:

Biodegradation: primary biodegradation with a rate constant $k = 0.131$ d^{-1} and $t_{1/2} = 5.30$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} \sim 0.2\text{--}4.0$ d (estimated, Staples et al. 1997).

Surface water: primary biodegradation with a rate constant $k = 0.131\text{ d}^{-1}$ and $t_{1/2} = 5.30$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Groundwater:

Sediment:

Soil:

Biota:

15.1.3.15 Diisononyl phthalate (DINP)

Common Name: Diisononyl phthalate

Synonym: DINP

Chemical Name:

CAS Registry No: 28553-12-0, 68515-48-0

Molecular Formula: $C_{26}H_{42}O_4$

Molecular Weight: 418.609

Melting Point ($^{\circ}C$):

-48 (Staples et al. 1997)

Boiling Point ($^{\circ}C$):

413 (Fishbein & Albro 1972)

Density (g/cm^3 at $20^{\circ}C$):

0.995 (Fishbein & Albro 1972)

Molar Volume (cm^3/mol):

569.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.20 ± 0.1 (shake flask-GC, Howard et al. 1985)

0.20, 0.0006 (quoted, Staples et al. 1997)

< 0.001 ; 7.8×10^{-5} , 2.3×10^{-5} (recommended; calculated-QSAR, Staples et al. 1997)

3.08×10^{-4} (calculated-QSPR, Cousins & Mackay 2000)

6.1×10^{-4} ($20^{\circ}C$, shake flask/slow stirring-GC/MS, Letinski et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$):

7.2×10^{-5} (gas saturation method, Howard et al. 1985)

6.67×10^{-5} ; 1.33×10^{-8} , 3.07×10^{-5} (recommended; calculated-QSAR, Staples et al. 1997)

6.81×10^{-6} (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

9.26 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

> 8.0 ; 9.0, 9.4 (recommended; calculated-QSAR, Staples et al. 1997)

8.60 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

11.03 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

3.27 (*Arca zebra*, Solbakken et al. 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} \sim 0.2\text{--}2.0$ d (estimated, Staples et al. 1997).

$k_{OH} = 23.408 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 0.35$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Hydrolysis:

Biodegradation: primary biodegradation with a rate constant $k = 0.131 \text{ d}^{-1}$ and $t_{1/2} = 5.31$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 848 \text{ mL} \cdot \text{g} \cdot \text{d}^{-1}$ (*Arca zebra*, 26.5°C, Solbakken et al. 1985; quoted, Staples et al. 1997)

$k_2 = 0.46 \text{ d}^{-1}$ (*Arca zebra*, 26.5°C, Solbakken et al. 1985; quoted, Staples et al. 1997)

$k_2 = 0.02 \text{ d}^{-1}$ (*Diplora strigosa*, 26.5°C, Solbakken et al. 1985; quoted, Staples et al. 1997)

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} \sim 0.2\text{--}2.0$ d (estimated, Staples et al. 1997).

Photodegradation $t_{1/2} = 0.35$ h based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Surface water: primary biodegradation with a rate constant $k = 0.131 \text{ d}^{-1}$ and $t_{1/2} = 5.31$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Groundwater:

Sediment:

Soil:

Biota:

15.1.3.16 Di-isodecyl phthalate (DIDP)

Common Name: Di-isodecyl phthalate

Synonym: DIDP

Chemical Name: di-diisodecyl phthalate

CAS Registry No: 26761-40-0, 68515-49-1

Molecular Formula: $C_{28}H_{46}O_4$

Molecular Weight: 446.663

Melting Point ($^{\circ}C$):

- 48 (Stephenson & Malanowski 1987)
- 46 (Staples et al. 1997)
- 50 (Lide 2003)

Boiling Point ($^{\circ}C$):

- 450 (Stephenson & Malanowski 1987)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

- 464.8 (Stephenson & Malanowski 1987)
- 613.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

- < 50 (quoted from Monsanto Chemical Co. data sheets, Peakall 1975)
- 1.19 ± 0.19 (shake flask-GC, Howard et al. 1985)
- 0.28 (shake flask-nephelometry, Hollifield 1979)
- 0.19, 0.28, < 0.00013 (quoted, Staples et al. 1997)
- < 0.001; 2.2×10^{-6} , 7.4×10^{-6} (recommended, calculated-QSAR, Staples et al. 1997)
- 3.81×10^{-5} (calculated-QSPR, Cousins & Mackay 2000)
- 1.7×10^{-4} ($20^{\circ}C$, shake flask/slow stirring-GC/MS, Letinski et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

- $\log (P_L/kPa) = 14.0158 - 10984/(242.24 + T/K)$, temp range: 371–496 K, (Antoine eq., Stephenson & Malanowski 1987)
- $\log (P/mmHg) = 81.7895 - 7.4225 \times 10^3/(T/K) - 26.916 \cdot \log (T/K) + 1.1502 \times 10^{-2} \cdot (T/K) - 4.353 \times 10^{-14} \cdot (T/K)^2$; temp range 233–723 K (vapor pressure eq., Yaw et al. 1994)
- 6.67×10^{-5} , 7.47×10^{-5} (quoted, Staples et al. 1997)
- 6.67×10^{-5} ; 6.67×10^{-6} , 4.93×10^{-6} , 1.33×10^{-8} (recommended, calculated-QSAR, Staples et al. 1997)
- 1.84×10^{-6} (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

- 21.6 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 7.70 (estimated, Williams et al. 1995)
- > 8.0; 10.0, 1.0.3 (recommended; calculated-QSAR, Staples et al. 1997)
- 9.46 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

11.52 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

1.95–2.1, 2.06 (*Daphnia magna*, 20°C, range, mean, Brown & Thompson 1982a)

3.48, 3.60; 3.54 (*Mytilus edulis*, 15°C, exposure concn: 4.4, 4.17 µg/L; mean value, Brown & Thompson 1982b)

Sorption Partition Coefficient, $\log K_{OC}$:

5.04, 5.78, 5.16 (soil/sediment, exptl. data, Williams et al. 1995)

5.46, 7.60 (soil/sediment: mean value, calculated- K_{OW} , Williams et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} \sim 0.2$ – 2.0 d (estimated, Staples et al. 1997).

$k_{OH} = 26.217 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 0.32$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Hydrolysis:

Biodegradation: degradation $t_{1/2} = 4.0$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at 30°C (Kurane et al. 1977);

primary biodegradation with a rate constant $k = 0.088 \text{ d}^{-1}$ and $t_{1/2} = 9.6$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 795, 539 \text{ mL} \cdot \text{g} \cdot \text{d}^{-1}$ (*Mytilus edulis*, for exposure concn: 4.4, 41.7 µg/L, 15°C, Brown & Thompson 1982b; quoted, Staples et al. 1997).

$k_2 = 0.20, 0.18 \text{ d}^{-1}$ (*Mytilus edulis*, for exposure concn: 4.4, 41.7 µg/L, 15°C, Brown & Thompson 1982b; quoted, Staples et al. 1997).

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} \sim 0.2$ – 2.0 d (estimated, Staples et al. 1997).

photodegradation $t_{1/2} = 0.32$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Surface water: primary biodegradation with a rate constant $k = 0.088 \text{ d}^{-1}$ and $t_{1/2} = 9.6$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Groundwater:

Sediment:

Soil: degradation $t_{1/2} = 4.0$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at 30°C (Kurane et al. 1977).

Biota: depuration $t_{1/2} = 3.5$ and 3.8 d DIDP concn at 5 and 50 µg/L for *Mytilus edulis* at 15°C (Brown & Thompson 1982b).

15.1.3.17 Diundecyl phthalate (DUP)

Common Name Diundecyl phthalate

Synonym: DUP

Chemical Name: diundecyl phthalate

CAS Registry No: 3648-20-2

Molecular Formula: $C_{30}H_{50}O_4$

Molecular Weight: 474.716

Melting Point ($^{\circ}C$):

-9 (Staples et al. 1997)

35.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

0.96 (Staples et al. 1997)

Molar Volume (cm^3/mol):

658.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.789 (mp at $35.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.11 ± 0.28 (shake flask, Howard et al. 1985)

< 0.001 ; 1.6×10^{-7} , 4.2×10^{-7} (recommended; calculated-QSAR, Staples et al. 1997)

2.14×10^{-8} (calculated-UNIFAC, Thomsen et al. 1999)

4.41×10^{-6} (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at $25^{\circ}C$):

6.67×10^{-5} , 7.07×10^{-5} (quoted, Staples et al. 1997)

6.67×10^{-5} ; 1.33×10^{-8} , 1.6×10^{-7} (recommended; calculated-QSAR, Staples et al. 1997)

4.97×10^{-7} (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

50.5 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

> 8.0 ; 11.2, 11.5 (recommended; calculated-QSAR, Staples et al. 1997)

10.54 (calculated-UNIFAC, Thomsen et al. 1999)

10.33 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

12.02 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} \sim 0.2\text{--}2.0$ d (estimated, Staples et al. 1997).

$k_{\text{OH}} = 31.847 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 0.26$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Hydrolysis:

Biodegradation: primary biodegradation rate constant $k = 0.115 \text{ d}^{-1}$ and $t_{1/2} = 6.17$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

aerobic biodegradation in aquatic environments, first order $k = 0.03 \text{ d}^{-1}$ with $t_{1/2} = 23$ d in unstirred river water (Peterson & Staples 2003)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} \sim 0.2\text{--}2.0$ d (estimated, Staples et al. 1997)

Photodegradation $t_{1/2} = 0.26$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Surface water: primary biodegradation rate constant $k = 0.115 \text{ d}^{-1}$ and $t_{1/2} = 6.17$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

biodegradation $t_{1/2} = 23$ d in aerobic aquatic environments (Peterson & Staples 2003)

Sediment:

Soil:

Biota:

15.1.3.18 Ditridecyl phthalate (DTDP)

Common Name: Ditridecyl phthalate

Synonym: DTDP

Chemical Name:

CAS Registry No: 119-06-2. 68515-47-9

Molecular Formula: $C_{34}H_{58}O_4$

Molecular Weight: 530.823

Melting Point ($^{\circ}C$):

-37 (Staples et al. 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

0.953 (Staples et al. 1997)

Molar Volume (cm^3/mol):

746.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.34 (shake flask-nephelometry, Hollifield 1979)

< 0.30 (shake flask, Howard et al. 1985; quoted, Adams et al. 1995)

0.34, < 0.30 (quoted, Staples et al. 1997)

< 0.001; 1.5×10^{-9} , 4.2×10^{-9} (recommended, calculated-QSAR, Staples et al. 1997)

4.07×10^{-10} (calculated-UNIFAC, Thomsen et al. 1999)

7.0×10^{-8} (calculated-QSPR, Cousins & Mackay 2000)

Vapor Pressure (Pa at $25^{\circ}C$):

< 6.67×10^{-5} (quoted, Staples et al. 1997)

< 6.67×10^{-5} ; 1.33×10^{-9} , 3.33×10^{-9} (recommended; calculated-QSAR, Staples et al. 1997)

3.63×10^{-8} (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

275 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

8.40 (estimated, Williams et al. 1995)

> 8.0; 13.1, 13.4 (recommended; calculated-QSAR, Staples et al. 1997)

12.28 (calculated-UNIFAC, Thomsen et al. 1999)

12.06 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

13.01 (calculated-QSPR, Cousins & Mackay 2000)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

6.08 (soil/sediment, Williams et al. 1995; quoted, Staples et al. 1997)

5.87, 6.45, 6.28; 6.08 (soil/sediment: exptl. data; mean value, Williams et al. 1995)

6.26, 8.30 (soil/sediment: exptl. mean, calculated- K_{OW} , Williams et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: atmospheric photooxidation $t_{1/2} \sim 0.2\text{--}2.0$ d (estimated, Staples et al. 1997).

Hydrolysis:

Biodegradation: degradation $t_{1/2} = 10.5$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at 30°C (Kurane et al. 1977);

primary biodegradation rate constant $k = 0.029\text{ d}^{-1}$ and $t_{1/2} = 27.6$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric photooxidation $t_{1/2} \sim 0.2\text{--}2.0$ d (estimated, Staples et al. 1997).

Surface water: primary biodegradation rate constant $k = 0.029\text{ d}^{-1}$ and $t_{1/2} = 27.6$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984).

Groundwater:

Sediment:

Soil: degradation $t_{1/2} = 10.5$ d by microorganisms (*Pseudomonas acidovorans* 256–1) from soil or waste water at 30°C (Kurane et al. 1977).

Biota:

15.1.3.19 Butyl benzyl phthalate (BBP)

Common Name: Butyl benzyl phthalate

Synonym: BBP, benzyl butyl phthalate

Chemical Name: butyl benzyl phthalate, benzyl butyl phthalate

CAS Registry No: 85-68-7

Molecular Formula: $C_{19}H_{20}O_4$, $C_6H_5COOCH_2C_6H_4COOC_4H_9$

Molecular Weight: 312.360

Melting Point ($^{\circ}C$):

–35.0 (Callahan et al. 1979; Mabey et al. 1982; Howard 1989)

Boiling Point ($^{\circ}C$):

370.0 (Verschuereen 1983; Howard 1989; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.111 (Staples et al. 1997)

Molar Volume (cm^3/mol):

369.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.90 (Hirzy et al. 1978)

0.71 (shake flask-nephelometry, practical grade, Hollifield 1979)

2.9 ± 1.2 (shake flask-GC, Gledhill et al. 1980)

40.2 (shake flask-LSC, Veith et al. 1980)

2.82 ($20^{\circ}C$, shake flask-UV, Leyder & Boulanger 1983)

2.90 ± 1.2 (Verschuereen 1983)

2.69 ± 0.15 (shake flask-HPLC/UV, Howard et al. 1985)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.00115 ($20^{\circ}C$, Gledhill et al. 1980)

0.00799 (calculated using Trouton's rule, Mabey et al. 1982)

0.00115 (Petrasek et al. 1983)

0.00115 ($20^{\circ}C$, Verschuereen 1983)

$\log(P_L/kPa) = 9.1472 - 4647.5/(T/K)$, temp range: 416–516 K, (Antoine eq., Stephenson & Malanowski 1987)

0.0011, 0.00133 (quoted, calculated-solvatochromic parameters and UNIFAC, Banerjee et al. 1990)

0.00067 (recommended, Staples et al. 1997)

0.0249 (calculated-QSPR, Cousins & Mackay 2000)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.132 (calculated-P/C, Wolfe et al. 1980a)

0.132 (calculated, Lyman et al. 1982)

0.841 (calculated-P/C, Mabey et al. 1982)

0.104 (quoted from WERL Treatability Data, Ryan et al. 1988)

0.077 (selected, Staples et al. 1997)

0.205 (calculated-QSPR, Cousins & Mackay 2000)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.80	(Hirzy et al. 1978)
5.80	(calculated as per Leo et al. 1971)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: direct photolysis (near surface) rate constant $k = 2 \times 10^{-4} \text{ h}^{-1}$ in natural water (Wolfe et al 1980a); photodegradation $t_{1/2} > 100 \text{ d}$ (Gledhill et al. 1980; quoted, Verschuere 1983; Howard 1989).

Oxidation: the free radical oxidation rate constant $k = 18 \text{ M}^{-1}\text{s}^{-1}$ for reaction with peroxy radical (Wolfe et al. 1980a);

rate constant $k \ll 360 \text{ M}^{-1}\text{h}^{-1}$ for singlet oxygen and $k = 280 \text{ M}^{-1}\text{h}^{-1}$ for peroxy radical (Mabey et al. 1982); photooxidation $t_{1/2} = 6\text{--}60 \text{ h}$, based on estimated rate data for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

predicted atmospheric photooxidation $t_{1/2} = 0.5\text{--}5.0$ d from Atkinson 1988 atmospheric-oxidation program (Staples et al. 1997).

$k_{\text{OH}} = 11.049 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 0.75$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Hydrolysis: the alkaline hydrolysis rate constant $k \sim 38 \text{ M}^{-1}\cdot\text{h}^{-1}$; hydrolytic $t_{1/2} = 80$ to 4000 d at pH 8 and 30°C (Wolfe et al. 1980a; quoted, Gledhill et al. 1980);

chemical degradation (hydrolysis) $t_{1/2} > 100$ d (Gledhill et al. 1980; quoted, Verschuere 1983; Howard 1989; selected, Staples et al. 1997).

Biodegradation: degradation $t_{1/2} \sim 2$ d in river water and $t_{1/2} = 2$ h in activated sludge (Saeger & Tucker 1976)

degradation $t_{1/2} = 3$ d by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977)

microbial degradation rate constant $k = 2.9 \times 10^{-8} \text{ mL}\cdot\text{organism}^{-1}\cdot\text{s}^{-1}$ (Wolfe et al. 1981a);

0–24% mineralization in > 8 wk in municipal digested sludge (Horowitz et al. 1982);

primary degradation accounted for > 95% loss in 7 d with an initial concentration of 1.0 mg/L in a lake water microcosm with $t_{1/2} < 4$ d and 100% primary degradation was observed after 9 d while $t_{1/2} = 2.0$ d (Gledhill et al. 1980; quoted, Verschuere 1983; Howard 1989);

significant degradation with rapid adaptation within 7 d in an aerobic environment with $k > 0.5 \text{ d}^{-1}$ (Tabak et al. 1981; quoted, Mills et al. 1982);

degradation rate constant $k = 0.043 \text{ d}^{-1}$ corresponding to $t_{1/2} = 19.4$ d in a shake flask biodegradation experiment (Sugatt et al. 1984);

greater than 90% degraded within 40 d in digested sludge (Shelton et al. 1984);

99% degraded in activated sludge systems in 48 h (O'Grady et al. 1985);

anaerobic digestion of sludge with first-order rate constant $k = 6.5 \times 10^{-3} \text{ h}^{-1}$ and $t_{1/2} = 107$ h (Ziogou et al. 1989);

aqueous aerobic $t_{1/2} = 24\text{--}168$ h, based on unacclimated river die-away test and aqueous anaerobic $t_{1/2} = 672\text{--}4320$ h, based on unacclimated anaerobic screening test data (Howard et al. 1991)

Aerobic biodegradation in aquatic environments, first order $k = 0.46 \text{ d}^{-1}$ with $t_{1/2} = 1.5$ d in unstirred river water, $k = 0.50 \text{ d}^{-1}$ with $t_{1/2} = 1.4$ d in microcosm, lake, $k = 0.35 \text{ d}^{-1}$ with $t_{1/2} = 2.0$ d in river water, $k = 0.14 \text{ d}^{-1}$ with $t_{1/2} = 5.0$ d in microcosm, un-impacted, $k > 0.023 \text{ d}^{-1}$ with $t_{1/2} < 3.0$ d in microcosm, Illinois river, and $k = 2.2 \text{ d}^{-1}$ with $t_{1/2} = 0.32$ d in shake river water (Peterson & Staples 2003)

Anaerobic biodegradation $k = 0.056 \text{ d}^{-1}$ with $t_{1/2} = 12.4$ d in undiluted sludge, batch incubation, $k = 0.19 \text{ d}^{-1}$ with $t_{1/2} = 3.7$ d in undiluted sludge, $k = 0.096 \text{ d}^{-1}$ with $t_{1/2} = 7.2$ d in 10% dilute sludge; $k = 0.076 \text{ d}^{-1}$ with $t_{1/2} = 9.1$ d in 10% freshwater sediment and $k = 0.051 \text{ d}^{-1}$ with $t_{1/2} = 13.6$ d in 10% salt marsh sediment (Peterson & Staples 2003)

Biotransformation: estimated rate constant $k = 3 \times 10^{-9} \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ for bacterial transformation in water (Mabey et al. 1982);

microbial transformation $k = (3.1 \pm 0.8) \times 10^{-11} \text{ L}\cdot\text{organism}^{-1}\cdot\text{h}^{-1}$ in natural aquatic systems (Steen et al. 1979; quoted, Steen 1991).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

depuration $t_{1/2} < 24$ and > 48 h from tissues of bluegill sunfish (Barrows et al. 1980).

$k_2 = 0.0464 \text{ d}^{-1}$ (10°C, 0.1 kg staghorn sculpin, lipid content 5%, Gobas et al. 2003)

$k_2 = 0.00397 \text{ d}^{-1}$ (10°C, 3 kg dogfish, lipid content 15%, Gobas et al. 2003)

Half-Lives in the Environment:

Air: $t_{1/2} = 1.5$ d in the atmosphere (GEMS 1984; quoted, Howard 1989);

$t_{1/2} = 6\text{--}60$ h, based on estimated rate data for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

photodegradation $t_{1/2} = 0.75$ d based on a global, seasonal and diurnal average OH radical concn of $1 \times 10^6 \text{ molecule cm}^{-3}$ in air (Peterson & Staples 2003)

Surface water: biodegradation $t_{1/2} \sim 2$ h by naturally occurring, mixed microbial populations in river water (Saeger & Tucker 1976);

hydrolytic $t_{1/2} = 80$ to 4000 d at pH 8 and 30°C (Wolfe et al. 1980a; quoted, Gledhill et al. 1980);

$t_{1/2} = 2$ d for river water, $t_{1/2} < 4$ d for lake water-sediment microcosm, and $t_{1/2} < 100$ d for chemical degradation (hydrolysis) (Gledhill et al. 1980);

biodegradation $t_{1/2} = 19.4$ d in an acclimated shake flask CO_2 evolution test (Sugatt et al. 1984);

overall $t_{1/2} = 24\text{--}168$ h, based on unacclimated river die-away test (Howard et al. 1991)

biodegradation $t_{1/2} = 0.32\text{--}3$ d in aerobic aquatic environments (Peterson & Staples 2003)

Ground water: $t_{1/2} = 48\text{--}4320$ h, based on estimated unacclimated aqueous aerobic and anaerobic biodegradation half-lives (Howard et al. 1991).

Sediment: anaerobic biodegradation $t_{1/2} = 9.1$ h in 10% freshwater sediment, and $t_{1/2} = 13.6$ d in 10% salt marsh sediment (Peterson & Staples 2003)

Soil: degradation $t_{1/2} = 3$ d by microorganisms isolated from soil or waste water at 30°C (Kurane et al. 1977)

$t_{1/2} = 10\text{--}50$ d via volatilization subject to plant uptake from the soil (Ryan et al. 1988);

$t_{1/2} = 24\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota: depuration $t_{1/2} < 24$ and > 48 h (tissues of bluegill sunfish in 21-d exposure, Barrows et al. 1980)

$t_{1/2} < 2$ d from bluegill sunfish (Gledhill et al. 1980; quoted, Verschueren 1983).

15.1.4 PHOSPHATE ESTERS

15.1.4.1 Triaryl phosphates

15.1.4.1.1 *t*-Butylphenyl diphenyl phosphate (tBPDP, BPDP)

Common Name: *t*-Butylphenyl diphenyl phosphate

Synonym: TBPDP, BPDP

Chemical Name:

CAS Registry No: 56803-37-3

o-*tert*-butylphenyl diphenyl phosphate (*o*-TBPDP) 83242-23-2

m-*tert*-butylphenyl diphenyl phosphate (*m*-TBPDP) 83242-22-2

p-*tert*-butylphenyl diphenyl phosphate (*p*-TBPDP) 981-40-8

Molecular Formula: C₂₂H₂₃O₄P, (CH₃)C₆H₄(C₆H₅)₂O₄P

Molecular Weight: 382.389

Melting Point (°C):

−21 (Muir 1984)

Boiling Point (°C):

195/0.20 mmHg, 200/0.2 mmHg, 200/0.20 mmHg (*o*-, *m*-, *p*-TBPDP, Wightman & Malaiyanki 1983)

261/6 mmHg (Muir 1984)

420 (Boethling & Cooper 1985)

Density (g/cm³):

Molar Volume (cm³/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

3.2 (shake flask-GC, Saeger et al. 1979)

Vapor Pressure (Pa at 25°C):

180 (200°C, Muir 1984)

1.87 × 10^{−4} (quoted measured value, Boethling & Cooper 1985)

6.13 × 10^{−5} (estimated from boiling point, Boethling & Cooper 1985)

Henry's Law Constant (Pa·m³/mol at 25°C):

0.086 (estimated-P/C, Muir 1984, Muir et al. 1985)

0.0223, 0.0073 (calculated-P/C, Boethling & Cooper 1985)

2.18 (gas stripping, Muir et al. 1985)

Octanol/Water Partition Coefficient, log K_{OW}:

5.12 (shake flask-concn ratio, Saeger et al. 1979;)

3.23, 4.76, 6.44; 5.97 (RP-HPLC-*k'* correlation; mean value, Renberg et al. 1980)

Bioconcentration Factor, log BCF:

2.89 (calculated, Saeger et al. 1979)

3.36, 3.04, 3.13 (rainbow trout: "initial rate" method, static test, Biofac, Muir et al. 1983b)

2.89 (rainbow trout, calculated with hexane extractable radioactivity, Muir et al. 1983b)

3.52, 2.89, 2.70 (fathead minnow: "initial rate" method, static test, Biofac, Muir et al. 1983b)

2.76 (fathead minnow, calculated with hexane extract, Muir et al. 1983b)

- 3.94, 2.89 (rainbow trout, fathead minnow, static expt., quoted, Boethling & Cooper 1985)
 3.64 (calculated- K_{OW} , Boethling & Cooper 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.16 (calculated- K_{OW} , Muir 1984)
 3.36 (soil, estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 128$ d from 1 m deep water system was estimated to be 128 d (calculated, Muir 1984)
 moderate rate of volatilization from water, $t_{1/2} = 152$ d at 0.5-m depth (Muir et al. 1985).

Photolysis:

Oxidation:

Hydrolysis: $t_{1/2} = 1.92$ h in pH 13.0 acetone/water 1:1 solution (Muir et al. 1983b).

Biodegradation: complete primary degradation in 10–21 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 28$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 22.8 \text{ h}^{-1}$, 29.3 h^{-1} (rainbow trout, exposure concn 5, 50 $\mu\text{g/L}$, Muir et al. 1983b).

$k_1 = 17.7 \text{ h}^{-1}$, 18.0 h^{-1} (fathead minnow, exposure concn 5, 50 $\mu\text{g/L}$, Muir et al. 1983b).

$k_2 = 0.0137 \text{ h}^{-1}$, 0.0113 h^{-1} (rainbow trout, exposure concn 5, 50 $\mu\text{g/L}$ for 0–144 h interval, Muir et al. 1983b).

$k_2 = 0.0106 \text{ h}^{-1}$, 0.0111 h^{-1} (rainbow trout, exposure concn 5, 50 $\mu\text{g/L}$ for 0–432 h interval, Muir et al. 1983b).

$k_2 = 0.0088 \text{ h}^{-1}$, 0.0074 h^{-1} (fathead minnow, exposure concn 5, 50 $\mu\text{g/L}$ for 0–144 h interval, Muir et al. 1983b).

$k_2 = 0.0078 \text{ h}^{-1}$, 0.0070 h^{-1} (fathead minnow, exposure concn 5, 50 $\mu\text{g/L}$ for 0–432 h interval, Muir et al. 1983b).

Half-Lives in the Environment:

Air:

Surface water: complete primary degradation in 10–21 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 28$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);

hydrolysis $t_{1/2} = 1.92$ h in pH 13.0 acetone/water 1:1 solution (Muir et al. 1983b);

$t_{1/2} = 128$ d, volatilization from 1 m deep water system (Muir 1984);

pseudo-first-order $t_{1/2} = 0.44$ d in pond water; moderate rate of volatilization from water column with $t_{1/2} = 152$ d at 0.5-m depth (Muir et al. 1985).

Groundwater:

Sediment: pseudo-first-order $t_{1/2} = 39$ d in pond bottom sediment during a 49-d period (Muir et al. 1985).

Soil:

Biota: depuration $t_{1/2} = 42$ h in chironomid larvae (Muir et al. 1985).

15.1.4.1.2 Cresyl diphenyl phosphate (CDP)

Common Name: Cresyl diphenyl phosphate

Synonym: CDP

Chemical Name:

CAS Registry No: 78-31-9

o-CDP 5254-12-6

m-CDP 69500-28-3

p-CDP 78-31-9

Molecular Formula: C₁₉H₁₇O₄P

Molecular Weight: 340.309

Melting Point (°C):

−40 (*p*-CDP, Lide 2003)

Boiling Point (°C):

180/0.60 mmHg, 190/0.60 mmHg, 200/0.70 mmHg (*o*-, *m*-, *p*-CDP, Wightman & Malaiyandi 1983)

368, 390 (at 1 atm, Boethling & Cooper 1985)

235–255/4 mmHg, 255/5 mmHg (Boethling & Cooper 1985)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F:

Water Solubility (g/m³ or mg/L at 25°C):

2.60 (shake flask-GC, Saeger et al. 1979)

Vapor Pressure (Pa at 25°C):

5.47 × 10^{−3}, 1.21 × 10^{−3}, 3.87 × 10^{−4}, 2.80 × 10^{−4} (estimated from reported boiling points, Boethling & Cooper 1985)

6.27 × 10^{−4} (quoted measured value, Boethling & Cooper 1985)

Henry's Law Constant (Pa·m³/mol at 25°C):

0.470 (calculated-P/C, Muir 1984)

0.798, 0.162, 0.0820, 0.0507, 0.0355 (calculated-P/C, Boethling & Cooper 1985)

Octanol/Water Partition Coefficient, log K_{OW}:

4.505 (shake flask-concn ratio, Saeger et al. 1979)

3.23, 3.63, 4.06; 3.77 (RP-HPLC-*k'* correlation; mean value, Renberg 1980)

4.40 (Bengtsson et al. 1986)

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF:

2.56 (calculated, Saeger et al. 1979)

2.99 (calculated-K_{OW}, Boethling & Cooper 1985)

2.002.34 (bleak, 280-d exposure, Bengtsson et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

- 3.83 (calculated- K_{OW} , Muir 1984)
- 3.41 (soil, estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} \sim 22$ d for 1 m deep water system (estimated, Muir 1984).

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: complete primary degradation in less than 7 d for river die-away studies when exposed to the natural microbial population of water; $t_{1/2} < 7$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: complete primary degradation in less than 7 d for river die-away studies when exposed to the natural microbial population of water; $t_{1/2} < 7$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);

volatilization $t_{1/2} = 22$ d for 1 m deep water system (estimated, Muir 1984).

Groundwater:

Sediment:

Soil:

Biota: elimination $t_{1/2} = 4$ d or less (beak, 28-d exposure, Bengtsson 1986).

15.1.4.1.3 Isopropylphenyl diphenyl phosphate (IPDP)

Common Name: Isopropylphenyl diphenyl phosphate

Synonym: IPPDP, IPDP

Chemical Name:

CAS Registry No: 28108-99-8

o-IPPDP 64532-94-1

m-IPPDP 69515-46-4

p-IPPDP 55864-04-5

Molecular Formula: $C_{21}H_{21}O_4P$, $(CH_3)_2CHC_6H_4O_4P$

Molecular Weight: 368.362

Melting Point ($^{\circ}C$):

-26 (Muir 1984)

Boiling Point ($^{\circ}C$):

175/0.05 mmHg, 180/0.02 mmHg, 185/0.05 mmHg (Wightman & Malaiyandi 1983)

220–230/1 mmHg (Muir 1984, Boethling & Cooper 1985)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.20 (room temp, shake flask-GC, Saeger et al. 1979)

Vapor Pressure (Pa at $25^{\circ}C$):

1.47×10^{-4} (estimated from boiling point, Boethling & Cooper 1985)

3.73×10^{-5} (quoted measured value, Boethling & Cooper 1985)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.243, 0.0628 (calculated-P/C, Boethling & Cooper 1985)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.305 (shake flask-concn ratio, Saeger et al. 1979; quoted, Muir 1984)

3.23, 4.30, 5.40, 6.57; 5.99 (RP-HPLC- k' correlation; mean, Renberg et al. 1980)

5.70 (quoted measured value, Boethling & Cooper 1985)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

2.99 (calculated, Saeger et al. 1979)

3.88 (estimated from solubility, Boethling & Cooper 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

4.26 (calculated- K_{OW} , Muir 1984)

3.45 (soil, estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: complete primary degradation in 21 d for river die-away studies when exposed to the natural microbial population of water; $t_{1/2} = 28\text{--}48$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: complete primary degradation in 21 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} = 28\text{--}48$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979).

Groundwater:

Sediment:

Soil:

Biota:

15.1.4.1.4 4-Cumylphenyl diphenyl phosphate (CPDPP)

Common Name: 4-Cumylphenyl diphenyl phosphate

Synonym: CPDPP

Chemical Name:

CAS Registry No: 84602-56-2

Molecular Formula: $C_{27}H_{25}O_4P$, $C_6H_5C(CH_3)_2(C_6H_5)_2O_4P$

Molecular Weight: 444.458

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

230–235/0.15 mmHg (Wightman & Malaiyandi 1983)

494 (Boethling & Cooper 1985)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.063 ± 0.025 (Mayer et al. 1981)

0.060 (Boethling & Cooper 1985)

Vapor Pressure (Pa at $25^{\circ}C$):

1.726×10^{-9} (estimated from boiling point, Boethling & Cooper 1985)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

8.62×10^{-4} (calculated-P/C, Boethling & Cooper 1985)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.08 (Mayer et al. 1981)

6.10 (quoted, Boethling & Cooper 1985)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

3.40 (calculated- K_{ow} , Mayer et al. 1981)

3.45, 3.10–3.66 (mean value, range, rainbow trout 90-d exposure, Mayer et al. 1981)

4.40 (calculated- K_{ow} , Boethling & Cooper 1985)

Sorption Partition Coefficient, $\log K_{oc}$:

4.53 (soil, calculated-S and K_{ow} , Mayer et al. 1981)

4.30 (soil, estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis: hydrolyzed in alkaline solutions, $t_{1/2} = 5$ d at pH 9 and 25°C, but $t_{1/2} > 28$ d at pH 5 and 7 (Mayer et al. 1981).

Biodegradation: $t_{1/2} > 21$ d in river die-away procedure; the half-lives of the disappearance by sediment adsorption and degradation of CPDFF for microcosm core conditions: active, aerated or nitrogen-purge, light or dark $t_{1/2} < 3$ d, sterile, aerated, light $t_{1/2} = 7$ d and sterile, nitrogen-purge, light $t_{1/2} > 28$ d (Mayer et al. 1981).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: hydrolyzed in alkaline solutions, $t_{1/2} = 5$ d at pH 9 and 25°C, but $t_{1/2} > 28$ d at pH 5 and 7; biodegradation $t_{1/2} > 21$ d in river die-away procedure (Mayer et al. 1981).

Groundwater:

Sediment: rapidly disappeared from the active core-water columns, 90% in < 3 d in the microcosm-lake simulation study, the half-lives of the disappearance of CPDFF by sediment adsorption and degradation are, for microcosm core conditions: active, aerated or nitrogen-purge, light or dark $t_{1/2} < 3$ d; sterile, aerated, light $t_{1/2} = 7$ d and sterile, nitrogen-purge, light $t_{1/2} > 28$ d (Mayer et al. 1981).

Soil:

Biota:

15.1.4.1.5 Nonylphenyl diphenyl phosphate (NPDPP)

Common Name: Nonylphenyl diphenyl phosphate

Synonym: NPDPP, Pydral 50E

Chemical Name:

CAS Registry No: 38638-05-0

m-NPDPP 84602-55-1

p-NPDPP 64532-97-4

Molecular Formula: $C_{27}H_{33}O_4P$, $C_9H_{19}(C_6H_5)_3O_4P$

Molecular Weight: 452.522

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

220–225/0.07 mmHg (*m*-NPDPP, Wightman & Malaiyandi 1983)

215–220/0.07 mmHg (*p*-NPDPP, Wightman & Malaiyandi 1983)

471 (Boethling & Cooper 1985)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.77 ± 0.25 (Mayer et al. 1981)

0.80 (Boethling & Cooper 1985)

Vapor Pressure (Pa at $25^{\circ}C$):

4.61 (calculated- K_{ow} , Muir 1984)

3.69 (soil, estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k, Half-Lives, $t_{1/2}$

Volatilization:

Photolysis:

Oxidation:

Hydrolysis: $t_{1/2} = 6$ d at pH 9 and 25°C, but $t_{1/2} > 28$ d at pH 5 and 7 (Mayer et al. 1981).

Biodegradation: primary biodegradation $t_{1/2} > 21$ d in river die-away procedure; half-life for disappearance by sediment adsorption and degradation in microcosms-lake simulation study, for core conditions: active, aerated or nitrogen-purge, light or dark $t_{1/2} < 3$ d; sterile, aerated, light $t_{1/2} = 7$ d and sterile, nitrogen-purge, light $t_{1/2} > 28$ d (Mayer et al. 1981).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: hydrolyzed in alkaline solutions, $t_{1/2} = 6$ d at pH 9 and 25°C, but $t_{1/2} > 28$ d at pH 5 and 7 (Mayer et al. 1981).

Groundwater:

Sediment: rapidly disappeared from the active core-water column, 90% in < 3 d. Time to 50% disappearance by sediment adsorption and degradation in microcosms-lake simulation study, for microcosm core conditions: active, aerated or nitrogen-purge, light or dark – $t_{1/2} < 3$ d; sterile, aerated, light – $t_{1/2} = 7$ d and sterile, nitrogen-purge, light – $t_{1/2} > 28$ d (Mayer et al. 1981).

Soil:

Biota:

15.1.4.1.6 Triphenyl phosphate (TPP)

Common Name: Triphenyl phosphate

Synonym: TPP

Chemical Name: triphenyl phosphate

CAS Registry No: 115-86-6

Molecular Formula: $C_{18}H_{15}O_4P$

Molecular Weight: 326.283

Melting Point ($^{\circ}C$):

50.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

245/11 mmHg (Verschuereen 1983; Budavari 1989; Lide 2003)

377 (Stephenson & Malanowski 1987)

Density (g/cm^3):

Molar Volume (cm^3/mol):

270.7 ($50^{\circ}C$, Stephenson & Malanowski 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.27, 0.292

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.90 (shake flask-GC, Saeger et al. 1979)

1.9 ± 0.2 (Mayer et al. 1981)

0.73 (shake flask-nephelometry, Hollifield 1979)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

< 13.3 ($30^{\circ}C$, Verschuereen 1983)

2.0×10^{-4} , 1.6×10^{-4} , 1.07×10^{-4} (estimated from reported boiling points, Boethling & Cooper 1985)

$\log(P/kPa) = 8.195 - 4253/(T/K)$; temp range 275 – $410^{\circ}C$ (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 28.0972 - 5.6684 \times 10^3/(T/K) - 5.9768 \cdot \log(T/K) - 3.1567 \times 10^{-9} \cdot (T/K) + 1.0751 \times 10^{-12} \cdot (T/K)^2$;
temp range 323 – $687 K$ (vapor pressure eq., Yaws et al. 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.168 (calculated-P/C, Muir 1984)

0.0265, 0.0284, 0.018 (calculated-P/C, Boethling & Cooper 1985)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.63 (shake flask-concn ratio, Saeger et al. 1979)

4.62 (Mayer et al. 1981)

4.78 (shake flask-concn ratio, Sasaki et al. 1981)

3.15 (RP-HPTLC- k' correlation, Renberg et al. 1980)

3.63–3.61 (literature average, Muir 1984)

4.60, 4.70 (Boethling & Cooper 1985)

3.90 (Bengtsson et al. 1986)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

2.45, 2.62 (quoted-rainbow trout data, calculated- K_{ow} , Saeger et al. 1979)

2.22 (fathead minnow, mixed isomers, Veith et al. 1979)

3.41	(rainbow trout, rate constant ratio k_1/k_2 , Muir et al. 1980)

2.62	(fathead minnow, calculated with hexane extract, Muir et al. 1983b)
2.76, 2.51	(rainbow trout in static test expt., quoted from Muir et al. 1983b, Boethling & Cooper 1985)
2.75, 2.62 1985)	(fathead minnow in static test expt., quoted from Muir et al. 1983b, Boethling & Cooper 1985)
3.26	(estimated- K_{OW} , Boethling & Cooper 1985)
2.60	(bleak, 28-d exposure, Bengtsson et al. 1986)

Sorption Partition Coefficient, log K_{OC} :

3.74	(soil, calculated-S, K_{OW} , Mayer et al. 1981)
3.89	(calculated- K_{OW} , Muir 1984)
3.49	(calculated-solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constant, k, and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 60$ d (Muir 1984).

Photolysis:

Oxidation:

Hydrolysis:

$k = 0.0253$ and 0.0227 L mol⁻¹ s⁻¹ for the colorimetric and acid-base method, respectively, in dioxan-water (3:1 v/v) at 35°C; the mean second order rate constants: $10^3 k_2$ at 0°C, 10.1°C, 24.7°C, and 35°C were 0.235, 0.477, 1.06, and 2.32 L mol⁻¹ s⁻¹, respectively, in 60% dioxan-water (Barnard et al. 1961);

$t_{1/2} = 1.3$ yr under neutral conditions from kinetic data in the environment (estimated, Saeger et al. 1979)

$k = 6.0 \times 10^{-8}$ s⁻¹, with $t_{1/2} = 130$ d, the pseudo-first-order rate constant in dioxan-water (3:1 v/v) at 100°C; while the second-order rate constant $k = 0.0106$ L mol⁻¹ s⁻¹ with $t_{1/2} = 23$ d at pH 9.5 and $t_{1/2} = 474$ d at pH 8.2 under alkaline conditions at 24.7°C (quoted, Howard & Deo 1979);

$k(\text{second order alkaline}) = 0.027$ M⁻¹ s⁻¹, with an estimated $t_{1/2} \sim 1000$ yr (Wolfe 1980)

$t_{1/2} = 19$ d at pH 7 but $t_{1/2} = 3$ d at pH 9 at 25°C, the most important process for abiotic transformation of aryl phosphates in the environment, much more rapid at alkaline than at neutral pH (Mayer et al. 1981, quoted, Boethling & Cooper 1985)

$t_{1/2} = 7.5$ d at pH 8.2, $t_{1/2} = 1.3$ d at pH 9.5, $t_{1/2} = 20$ –25 d at pH 7 and 21°C (Howard & Deo 1979; quoted, Boethling & Cooper 1985)

$t_{1/2} = 0.49$ h at pH 13.0 in acetone/water 1:1 solution (Muir et al. 1983b)

Biodegradation: complete primary degradation in less than 7 d in the river die-away studies exposed to the natural microbial population of the river water; $t_{1/2} < 7$ d for primary biodegradation rate for from semicontinuous activated sludge studies (Saeger et al. 1979);

readily biodegraded, in the semicontinuous activated sludge test, degradation of TPP exceeding 95% was observed over a 24-h cycle, and river die-away tests showed $t_{1/2} = 2$ –4 d; time to 50% from the active core water-column disappearance for TPP in microcosms simulating lake conditions was 3–10 d (Mayer et al. 1981).

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 46.36$ h⁻¹ (rainbow trout, Muir et al. 1980).

$k_2 = 0.0197$ h⁻¹ (rainbow trout, 0–9 d, fast clearance, Muir et al. 1980).

$k_2 = 0.00245$ h⁻¹ (rainbow trout, 9–31 d, slow clearance, Muir et al. 1980)

- $k_1 = 0.4\text{--}0.6\text{ h}^{-1}$ (*Chironomus tentans* larvae in pond sediment-water system, 96-h exposure, calculated by using first-order kinetic and concn factors, Muir et al. 1983)
- $k_1 = 2.1\text{--}4.2\text{ h}^{-1}$ (*Chironomus tentans* larvae in river sediment-water system, 96-h exposure, calculated by using first-order kinetic and concn factors, Muir et al. 1983)
- $k_1 = 3.3\text{--}10.4\text{ h}^{-1}$ (*Chironomus tentans* larvae in sediment (sand)-water system, 96-h exposure, calculated by using first-order kinetic and concn factors, Muir et al. 1983)
- $k_1 = 3.3\text{--}16.9\text{ h}^{-1}$ (*Chironomus tentans* larvae in sediment (sand)-water system, 96-h exposure, calculated by using initial uptake data of 0–12 h, Muir et al. 1983)
- $k_2 = 0.023\text{ h}^{-1}$ (*Chironomus tentans* larvae in pond sediment-water system, calculated by concn decay curve, Muir et al. 1983)
- $k_2 = 0.039\text{ h}^{-1}$ (*Chironomus tentans* larvae in river water system, calculated by concentration decay curve, Muir et al. 1983)
- $k_2 = 0.011\text{ h}^{-1}$ (*Chironomus tentans* larvae in river sediment-water system, calculated by concentration decay curve, Muir et al. 1983)
- $k_2 = 0.016\text{ h}^{-1}$ (*Chironomus tentans* larvae in sediment (sand)-water system, calculated by concentration decay curve, Muir et al. 1983).
- $k_1 = 22.7\text{ h}^{-1}$, 20.7 h^{-1} (rainbow trout, exposure concn 5, 50 $\mu\text{g/L}$, Muir et al. 1983b).
- $k_1 = 16.5\text{ h}^{-1}$, 14.5 h^{-1} (fathead minnow, exposure concn 5, 50 $\mu\text{g/L}$, Muir et al. 1983b).
- $k_2 = 0.0116\text{ h}^{-1}$, 0.0144 h^{-1} (rainbow trout, exposure concn 5, 50 $\mu\text{g/L}$ for 0–432 h interval, Muir et al. 1983b)
- $k_2 = 0.0121\text{ h}^{-1}$, 0.0140 h^{-1} (fathead minnow, exposure concn 5, 50 $\mu\text{g/L}$ for 0–144 h interval, Muir et al. 1983b).
- $k_2 = 0.0076\text{ h}^{-1}$, 0.0107 h^{-1} (fathead minnow, exposure concn 5, 50 $\mu\text{g/L}$ for 0–432 h interval, Muir et al. 1983b)

Half-Lives in the Environment:

Air:

Surface water: complete primary degradation in less than 7 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 7\text{ d}$ for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);

$t_{1/2} = 5\text{ h}$ in the water containing killifish and over 100 h for goldfish (Sasaki et al. 1981);

hydrolysis $t_{1/2} = 19\text{ d}$ at pH 7 but $t_{1/2} = 3\text{ d}$ at pH 9; $t_{1/2} = 2\text{--}4\text{ d}$ in river die-away test at 25°C, (Mayer et al. 1981, quoted, Boethling & Cooper 1985);

$t_{1/2} = 7.5\text{ d}$ at pH 8.2 and $t_{1/2} = 1.3\text{ d}$ at pH 9.5, $t_{1/2} = 20\text{--}25\text{ d}$ at pH 7 at 21°C (Howard & Deo 1979; quoted, Boethling & Cooper 1985);

estimated hydrolysis $t_{1/2} \sim 10^3\text{ yr}$ (Wolfe 1980);

volatilization $t_{1/2}(\text{calc}) = 60\text{ d}$ for 1 m deep water (Muir 1984).

Ground water:

Sediment: water-column disappearance $t_{1/2} \sim 3\text{ d}$ of TPP by both adsorption and degradation from microcosms-lake simulation study, for the microcosm core conditions: active, aerated, light or dark – $t_{1/2} = 3\text{ d}$; active, nitrogen-purge, light – $t_{1/2} = 3\text{ d}$; sterile, aerated, light – $t_{1/2} = 7\text{ d}$ and sterile, nitrogen-purge, light – $t_{1/2} = 10\text{ d}$ (Mayer et al. 1981).

Soil:

Biota: elimination $t_{1/2} = 30.4\text{ h}$ in pond sediment-water, $t_{1/2} = 17.6\text{ h}$ in river water, $t_{1/2} = 62.7\text{ h}$ in river sediment-water, $t_{1/2} = 44.4$ in sand-water systems (*Chironomus tentans* larvae, Muir et al. 1983a);

elimination $t_{1/2} = 4\text{ d}$ or less (bleak, 28-d exposure, Bengtsson et al. 1986).

15.1.4.1.7 Tricresyl phosphate (TCP)

Common Name: Tricresyl phosphate

Synonym: TCP, tritolyl phosphate, tris(methylphenyl) phosphate

Chemical Name: phosphoric acid tris(methylphenyl) ester

o-TCP:- tris(2-methylphenyl) phosphate; phosphoric acid tri(2-tolyl) ester

m-TCP:- tris(3-methylphenyl) phosphate; phosphoric acid tri(3-tolyl) ester

p-TCP:- tris(4-methylphenyl) phosphate; phosphoric acid tri(4-tolyl) ester

CAS Registry No:

o-TCP [78-30-8]; *m*-TCP[563-04-2]; *p*-TCP [78-32-0]

mixed isomers - tris(methylphenyl) phosphate [1330-78-5]

Molecular Formula: $C_{21}H_{21}O_4P$, $(CH_3C_6H_4)_3O_4P$

Molecular Weight: 368.362

Melting Point ($^{\circ}C$):

-25/-30	(<i>o</i> -TCP, Verschueren 1983)
-33	(mixed isomers, Riddick et al. 1986)
11, 25-26, 77-8	(<i>o</i> -TCP, <i>m</i> -TCP, <i>p</i> -TCP, Muir 1984)
11, 25, 77.5	(<i>o</i> -TCP, <i>m</i> -TCP, <i>p</i> -TCP, Stephenson & Malanowski 1987)
11, 25.5, 77.5	(<i>o</i> -TCP, <i>m</i> -TCP, <i>p</i> -TCP, Lide 2003)

Boiling Point ($^{\circ}C$):

201/1 mmHg (commercial quality, Burrow 1946)	
420	(<i>o</i> -TCP, Verschueren 1983)
410	(<i>o</i> -TCP, Muir 1984; Lide 2003)
313, 206, 216/0.5 mmHg (mixed isomers, <i>o</i> -, <i>m</i> -TCP, Riddick et al. 1986)	
241-255/4 mmHg, 265/5 mmHg (Boethling & Cooper 1985)	

Density (g/cm^3 at $20^{\circ}C$):

1.159, 1.1718	($25^{\circ}C$, mixture of isomers, <i>o</i> -TCP, Riddick et al. 1986)
1.16	(<i>o</i> -TCP, Verschueren 1983; Riddick et al. 1987; Budavari 1989)

Molar Volume (cm^3/mol):

308.1	($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)
-------	---

Enthalpy of Vaporization, ΔH_v (kJ/mol):

116.3, 102.9, 113	(<i>m</i> -TCP, Small et al. 1948)
113.4	(<i>p</i> -TCP, Small et al. 1948)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.40	(shake flask-GC, Saeger et al. 1979)
0.074	(<i>p</i> -TCP practical grade, shake flask-nephelometry; Hollifield 1979)
0.36	(mixed isomers, Muir 1984)
< 0.10	(Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.00516-0.00612* (*m*-TCP, Celluloid Corporation samples at $80^{\circ}C$, static and dynamic methods, measured range $80-136^{\circ}C$, Verhoek & Marshall 1939)

$\log(P/\mu mHg) = 15.886 - 6088/(T/K)$; temp range $80-136^{\circ}C$ (*m*-TCP, Celluloid Corporation samples, static and dynamic methods, Verhoek & Marshall 1939)

- 0.0132* (*m*-TCP, Eastman Kodak Co. samples at 85.2°C, static and dynamic methods, measured range 85.2–126°C, Verhoek & Marshall 1939)
 $\log(P/\mu\text{mHg}) = 13.982 - 5373/(T/K)$; temp range 85.2–126°C (*m*-TCP, Eastman Kodak Co. samples, static and dynamic methods, Verhoek & Marshall 1939)
 0.0113* (*p*-TCP, 92°C, static and dynamic methods, measured range 92–145°C, Verhoek & Marshall 1939)
 $\log(P/\mu\text{mHg}) = 15.223 - 5926/(T/K)$; temp range 92–145°C (*p*-TCP, static and dynamic methods, Verhoek & Marshall 1939)
 4.13×10^{-4} (extrapolated from exptl. data, measured range 140–156°C, commercial quality, ebulliometry, Burrows 1946)
 $\log(P/\text{mmHg}) = 12.69 - 5925/(T/K)$; temp range: ~100–150°C (Antoine eq. from exptl., effusion, technical grade, Small et al. 1948)
 $\log(P/\text{mmHg}) = 12.89 - 6088/(T/K)$ (*m*-TCP, Antoine eq. from literature, Small et al. 1948)
 $\log(P/\text{mmHg}) = 10.98 - 5373/(T/K)$ (*m*-TCP, Antoine eq. from literature, Small et al. 1948)
 $\log(P/\text{mmHg}) = 12.22 - 5895/(T/K)$; temp range: 100–150°C (*m*-TCP, Antoine eq., effusion method, data presented in graph and Antoine eq., Small et al. 1948)
 $\log(P/\text{mmHg}) = 12.22 - 5926/(T/K)$ (*p*-TCP, effusion, Antoine eq., Small et al. 1948)
 $\log(P/\mu\text{mHg}) = 14.12 - 5480/(T/K)$; temp range 115–168°C (*p*-TCP, pendulum-tensimeter method, Perry & Weber 1949)
 $\log(P/\text{mmHg}) = [-0.2185 \times 20835.9/(T/K)] + 10.654252$; temp range 154.6–313°C (tritoyl phosphate, Antoine eq., Weast 1972–73)
 $\log(P/\text{kPa}) = 11.81 - 5925/(T/K)$ (mixed isomers, Antoine eq., Riddick et al. 1986)
 $\log(P/\text{kPa}) = 8.56 - 4535/(T/K)$ (*o*-TCP, Antoine eq., Riddick et al. 1986)
 $\log(P/\text{kPa}) = 10.67 - 5787/(T/K)$ (*m*-TCP, Antoine eq., Riddick et al. 1986)
 $\log(P/\text{kPa}) = 13.24 - 5480/(T/K)$ (*p*-TCP, Antoine eq., Riddick et al. 1986)
 2.26×10^{-4} (*o*-TCP, Antoine eq., interpolated, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 8.565 - 4535/(T/K)$; temp range 293–700 K (*o*-TCP, Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 11.8856 - 6104.5/[(T/K) - 10.81]$; temp range 398–530 K (*m*-TCP, Antoine eq. for liquid state, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 10.245 - 5480/(T/K)$; temp range 388–530 K (*p*-TCP, Antoine eq. for liquid state, Stephenson & Malanowski 1987)
 3.07×10^{-4} , 1.25×10^{-4} (estimated from reported boiling points, Boethling & Cooper 1985)
 1.87×10^{-4} (quoted measured value, Boethling & Cooper 1985)
 6.10×10^{-6} (liquid P_L , GC-RT correlation, Hinckley et al. 1990)
 $\log(P/\text{mmHg}) = 21.1624 - 5.2756 \times 10^3/(T/K) - 3.3565 \cdot \log(T/K) + 8.666 \times 10^{-6} \cdot (T/K) - 2.9202 \times 10^{-9} \cdot (T/K)^2$;
 temp range 428–566 K (*o*-TCP, vapor pressure eq., Yaws et al. 1994)

Henry's Law Constant (Pa·m³/mol at 25°C):

- 0.0218 (calculated-P/C, Muir 1984, Muir et al. 1985)
 0.283, 0.172, 0.111 (calculated-P/C, Boethling & Cooper 1985)
 8.38 (*m*-TCP, gas stripping, Muir et al. 1985)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 3.42 (HPLC-RT correlation, Veith 1979)
 5.11 (shake flask-concn ratio, Saeger et al. 1979)
 4.30, 4.65; 4.50 (RP-HPTLC- k' correlation, Renberg et al. 1980)
 5.107–5.12 (Muir 1984)
 5.10–5.30 (Bengtsson et al. 1986)

Bioconcentration Factor, $\log BCF$:

- 5.505, 4.45, 3.57, 3.57, 3.46 (*p*-TCP, ecological magnification factors for alga, snail, mosquito, fish and *Daphnia*, Metcalf 1976)
 2.88 (calculated for rainbow trout, Saeger et al. 1979)
 2.22 (fathead minnow, 32-d exposure, Veith et al. 1979)
 3.44, 3.15, 3.17 (*p*-TCP for rainbow trout: "initial rate" method, static test, Biofac, Muir et al. 1983b)

- 2.89 (*p*-TCP for rainbow trout, calculated with hexane extract, Muir et al. 1983b)
 3.34, 2.97, 2.77 (*p*-TCP for fathead minnow: "initial rate" method, static test, Biofac, Muir et al. 1983b)
 2.85 (*p*-TCP, fathead minnow, calculated with hexane extractable radioactivity, Muir et al. 1983b)
 3.07, 2.89, 3.04 (*m*-TCP for rainbow trout: "initial rate" method, static test, Biofac, Muir et al. 1983b)
 2.49 (*m*-TCP for rainbow trout, calculated with hexane extractable radioactivity, Muir et al. 1983b)
 3.22, 2.77, 2.59 (*m*-TCP for fathead minnow: "initial rate" method, static test, Biofac, Muir et al. 1983b)
 2.66 (*m*-TCP, fathead minnow, calculated with hexane extract, Muir et al. 1983b)
 3.15, 2.89; 3.64 (rainbow trout: *p*-, *m*-TCP, static expt.; estimated- K_{OW} , Boethling & Cooper 1985)
 2.60 (bleak, 28-d exposure, Bengtsson et al. 1986)

Sorption Partition Coefficient, log K_{OC} :

- 4.44 (calculated- K_{OW} , Muir 1984)
 3.86 (estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 496$ d (estimated, Muir 1984).

Photolysis:

Oxidation:

Hydrolysis: $t_{1/2} = 73$ d and 52 d at 22°C for aryl phosphates (75% TCP and 18% TXP) in demineralized and river water (Wagemann et al. 1974; quoted, Boethling & Cooper 1985);
 degradation $t_{1/2} = 3$ –4 d for *o*-, *m*-TCP and 5 d for *p*-TCP in Lake Ontario water (Howard & Dao 1979)
 second order alkaline hydrolysis rate constant $k = 0.025$ M⁻¹ s⁻¹ (estimated, *p*-TCP, Wolfe 1980)
 $t_{1/2} = 1.31$ h, 1.66 h for *m*-TCP and *p*-TCP, respectively, at pH 13.0 in acetone/water 1:1 solution (Muir et al. 1983b).

Biodegradation: complete primary degradation in less than 7 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 7$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

For *p*-TCP:

- $k_1 = 25.8$ h⁻¹, 21.8 h⁻¹ (rainbow trout, exposure concn 5, 50 µg/L, Muir et al. 1983b).
 $k_1 = 15.9$ h⁻¹, 7.80 h⁻¹ (fathead minnow, exposure concn 5, 50 µg/L, Muir et al. 1983b).
 $k_2 = 0.0104$ h⁻¹, 0.00963 h⁻¹ (rainbow trout, exposure concn 5, 50 µg/L for 0–144 h interval, Muir et al. 1983b).
 $k_2 = 0.0106$ h⁻¹, 0.0133 h⁻¹ (rainbow trout, exposure concn 5, 50 µg/L for 0–432 h interval, Muir et al. 1983b).
 $k_2 = 0.0096$ h⁻¹, 0.0077 h⁻¹ (fathead minnow, exposure concn 5, 50 µg/L for 0–144 h interval, Muir et al. 1983b).
 $k_2 = 0.0070$ h⁻¹, 0.0095 h⁻¹ (fathead minnow, exposure concn 5, 50 µg/L for 0–432 h interval, Muir et al. 1983b).

For *m*-TCP:

- $k_1 = 28.8$ h⁻¹, 24.0 h⁻¹ (rainbow trout, exposure concn 5, 50 µg/L, Muir et al. 1983b).
 $k_1 = 18.2$ h⁻¹, 12.2 h⁻¹ (fathead minnow, exposure concn 5, 50 µg/L, Muir et al. 1983b).
 $k_2 = 0.0242$ h⁻¹, 0.0229 h⁻¹ (rainbow trout, exposure concn 5, 50 µg/L for 0–144 h interval, Muir et al. 1983b).
 $k_2 = 0.0115$ h⁻¹, 0.0149 h⁻¹ (rainbow trout, exposure concn 5, 50 µg/L for 0–432 h interval, Muir et al. 1983b).
 $k_2 = 0.0147$ h⁻¹, 0.0117 h⁻¹ (fathead minnow, exposure concn 5, 50 µg/L for 0–144 h interval, Muir et al. 1983b).
 $k_2 = 0.0085$ h⁻¹, 0.0101 h⁻¹ (fathead minnow, exposure concn 5, 50 µg/L for 0–432 h interval, Muir et al. 1983b).

Half-Lives in the Environment:

Air:

Surface water: complete primary degradation in less than 7 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 7$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);
 degradation $t_{1/2} = 3$ –4 d for *o*-, *m*-TCP and $t_{1/2} = 5$ d for *p*-TCP in Lake Ontario water (Howard & Dao 1979);
 $t_{1/2} = 1.66$ h and 1.31 h in pH 13.0 acetone/water 1:1 solution (Muir et al. 1983b);
 volatilization $t_{1/2}(\text{calc}) = 296$ d in 1 m deep water system (Muir 1984);

pseudo-first-order $t_{1/2} = 0.57$ d in pond water; moderate volatilization from water column with $t_{1/2} = 84$ d at 0.5-m depth (Muir et al. 1985).

Groundwater:

Sediment: $t_{1/2} = 39$ d in bottom sediment of a small pond (Muir et al. 1985).

Soil:

Biota: depuration $t_{1/2} = 135$ h in chironomid larvae (Muir et al. 1985);

elimination $t_{1/2} = 4$ d or less (bleak, 28-d exposure, Bengtsson et al. 1986).

15.1.4.1.8 Trixylenyl phosphate (TXP)

Common Name: Trixylenyl phosphate

Synonym: TXP

Chemical Name:

CAS Registry No: 25155-23-1

Molecular Formula: $C_{24}H_{27}O_4P$, $[(CH_3)_2C_6H_3]_3O_4P$

Molecular Weight: 410.442

Melting Point ($^{\circ}C$):

-20 (mixed isomers, Muir 1984)

Boiling Point ($^{\circ}C$):

261 (at 6 mmHg, Muir 1984)

225–295/6 mmHg, 248–265/4 mmHg, 270/3 mmHg (Boethling & Cooper 1985)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.89 (shake flask-GC, Saeger et al. 1979)

0.89 (mixed isomers, Muir 1984)

Vapor Pressure (Pa at $25^{\circ}C$):

7.20×10^{-4} , 1.47×10^{-4} , 3.067×10^{-5} (estimated from reported boiling points, Boethling & Cooper 1985)

6.93×10^{-6} ($30^{\circ}C$, Boethling & Cooper 1985)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.334, 0.0689, 0.0142, 0.00314 (calculated-P/C, Boethling & Cooper 1985)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.63 (shake flask-concn ratio, Saeger et al. 1979)

5.26 (RP-HPTLC- k' correlation, Renberg et al. 1980)

5.63 (Muir 1984)

5.70 (Boethling & Cooper 1985)

6.40–6.60 (Bengtsson et al. 1986)

Bioconcentration Factor, $\log BCF$:

3.15 (calculated for rainbow trout, Saeger et al. 1979)

4.04 (estimated from K_{OW} , Boethling & Cooper 1985)

3.11, 3.24, 3.28 (bleak, 28-d exposure, Bengtsson et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

4.44 (calculated- K_{OW} , Muir 1984)

3.67 (estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: 65% primary biodegradation in 14 weeks test duration for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} = 28\text{--}48$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: 65% primary biodegradation in 14 weeks test duration for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} = 28\text{--}48$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979).

Groundwater:

Sediment:

Soil:

Biota: eliminated $t_{1/2} = 4$ d or less (bleak, 28-d exposure, Bengtsson et al. 1986).

15.1.4.2 Triaryl/alkyl phosphates

15.1.4.2.1 Dibutyl phenyl phosphate (DBPP)

Common Name: Dibutyl phenyl phosphate

Synonym: DBPP

Chemical Name:

CAS Registry No: 2528-26-1

Molecular Formula: $C_{14}H_{23}O_4P$, $(C_4H_9)_2C_6H_5O_4P$

Molecular Weight: 286.303

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

200/20 mmHg (Muir 1984)

155/2 mmHg, 155/1 mmHg (quoted, Boethling & Cooper 1985)

Density (g/cm^3):

Molar Volume (cm^3/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

96 (shake flask-GC, Saeger et al. 1979)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

66.7 (200 $^{\circ}C$, Muir 1984)

0.084, 0.0307 (estimated from boiling points, Boethling & Cooper 1985)

746* (170 $^{\circ}C$, GC-RT correlation, measured range 170–200 $^{\circ}C$, Skene & Krzymien 1995)

Henry's Law Constant (Pa $\cdot m^3/mol$ at $25^{\circ}C$):

0.253, 0.089 (estimated-P/C, Boethling & Cooper 1985)

Octanol/Water Partition Coefficient, log K_{ow} :

4.27 (shake flask-concn ratio, Saeger et al. 1979)

3.23 (RP-HPTLC- k' correlation, Renberg et al. 1980)

Bioconcentration Factor, log BCF:

2.43 (calculated, Saeger et al. 1979)

3.04 (calculated- K_{ow} , Boethling & Cooper 1985)

Sorption Partition Coefficient, log K_{oc} :

3.70 (calculated- K_{ow} , Muir 1984)

2.56 (soil, estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 0.4$ d (calculated, Muir 1984)

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: complete primary degradation in less than 7 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 7$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: complete primary degradation in less than 7 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 7$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);

volatilization $t_{1/2} \sim 0.4$ d from 1 m deep water (Muir 1984).

Sediment:

Soil:

Biota:

15.1.4.2.2 2-Ethylhexyl diphenyl phosphate (EHDP)

Common Name: 2-Ethylhexyl diphenyl phosphate

Synonym: EHDP

Chemical Name:

CAS Registry No: 1241-94-7

Molecular Formula: $C_{20}H_{27}O_4P$, $C_8H_{17}(C_6H_5)_2O_4P$

Molecular Weight: 362.399

Melting Point ($^{\circ}C$):

-80 (Muir 1984)

Boiling Point ($^{\circ}C$):

181/0.6 mmHg (Wightman & Malaiyandi 1983)

239/1 mmHg (Muir 1984)

150/0.2 mmHg, 375/760 mmHg, 230/5 mmHg (Boethling & Cooper 1985)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.9 (shake flask-GC, Saeger et al. 1979)

Vapor Pressure (Pa at $25^{\circ}C$):

4.0×10^{-3} , 3.47×10^{-3} , 1.87×10^{-3} (estimated from reported boiling points, Boethling & Cooper 1985)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

1.60 (calculated-P/C, Muir 1982, 1984)

0.77, 0.648, 0.345 (calculated-P/C, Boethling & Cooper 1985)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.73 (shake flask-concn ratio, Saeger et al. 1979)

5.00 (RP-HPLC- k' correlation, Renberg et al. 1980)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

3.20 (calculated, Saeger et al. 1979)

3.17, 3.06; 3.12 (rainbow trout: calculated from rate constant ratio k_1/k_2 for exposure concn 5 and 50 $\mu g/L$; mean, Muir & Grift 1981)

3.52 (calculated- K_{ow} , Muir & Grift 1981)

4.11 (calculated- K_{ow} , Boethling & Cooper 1985)

Sorption Partition Coefficient, $\log K_{oc}$:

4.49 (calculated- K_{ow} , Muir 1984)

3.49 (estimated from solubility, Boethling & Cooper 1985)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: half-life for 1 m deep water was estimated to be 7 d (Muir 1984).

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: complete primary degradation in 10–21 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 28$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);

rapid biodegradation $t_{1/2} = 2$ d in river water (quoted, Muir & Grift 1981).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 48.5 \text{ h}^{-1}$, 33.0 h^{-1} (rainbow trout, exposure concn 5, 50 $\mu\text{g/L}$, Muir & Grift 1981)

$k_2 = 0.0298 \text{ h}^{-1}$, 0.0294 h^{-1} (rainbow trout, exposure concn 5, 50 $\mu\text{g/L}$, Muir & Grift 1981)

Half-Lives in the Environment:

Air:

Surface water: complete primary degradation in 10–21 d for river die-away studies when exposed to the natural microbial population of the water; $t_{1/2} < 28$ d for primary biodegradation rate from semicontinuous activated sludge studies (Saeger et al. 1979);

rapid biodegradation $t_{1/2} = 2$ d in river water (quoted, Muir & Grift 1981);

volatilization $t_{1/2} \sim 7$ d for 1 m deep water (estimated, Muir 1984).

Sorption Partition Coefficient, $\log K_{OC}$:

2.18 (calculated- K_{ow} , Muir 1984)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} \sim 536$ d from 1 m deep water system (estimated, Muir 1984).

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

biological $t_{1/2} = 1.65$ h and elimination $t_{1/2} = 0.7$ h for killifish (Sasaki et al. 1982).

Half-Lives in the Environment:

Air:

Surface water: first order reduction process in river water, an estimated $t_{1/2} \sim 2.3$ d in Rhine River (Zoeteman et al. 1980);

volatilization $t_{1/2}(\text{calc}) = 536$ d from 1 m deep water system (Muir 1984).

Groundwater:

Sediment:

Soil:

Biota: biological $t_{1/2} = 1.65$ h for accumulation, $t_{1/2} = 0.7$ h for elimination in killifish (Sasaki et al. 1982).

15.1.4.4.2 *Tris(1,3-dichloropropyl) phosphate (TDCPP)*

Common Name: Tris(1,3-dichloropropyl) phosphate

Synonym: TDCPP, TCPP, Fyrol FR-2, 1,3-dichloro-2-propanol phosphate (3:1), phosphoric acid tris(1,3-dichloro-2-propyl)ester, tris[2-chloro-1-(chloromethyl)ethyl]phosphate

Chemical Name:

Use: flame retardant

CAS Registry No: 40120-74-9

Molecular Formula: $C_9H_{15}Cl_6O_4P$, $(C_3H_5Cl_2)_3O_4P$

Molecular Weight: 430.906

Melting Point ($^{\circ}C$):

26.7 (Muir 1984)

viscous liquid (Budavari 1989)

Boiling Point ($^{\circ}C$):

236–237/5 mmHg (Muir 1984)

Density (g/cm^3 at $20^{\circ}C$):

1.5022 (Budavari 1989)

Molar Volume (cm^3/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.966

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

19.2 (Metcalf 1976)

7.0 (practical grade, shake flask-nephelometry, Hollifield 1979)

100 (Eldefrawi et al. 1977; quoted, Sasaki et al. 1981, Muir 1984)

~ 100 (Budavari 1989)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.76 (shake flask-concn ratio, Sasaki et al. 1981)

3.74 (quoted, Muir 1984)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

1.89–2.05 (killifish, 100-h exposure, static system, Sasaki et al. 1981)

0.48–0.70 (goldfish, 90-h exposure, static system, Sasaki et al. 1981)

1.67–2.03 (killifish, static system, Sasaki et al. 1982)

1.49–1.69 (killifish, 32-d exposure, continuous flow water system, Sasaki et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

3.41 (calculated- K_{OW} , Muir 1984)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$t_{1/2} = 31$ h in the water containing killifish and $t_{1/2} = 42$ h for goldfish, so that absorption occurred at similar rates in both fishes (Sasaki et al. 1981).

Half-Lives in the Environment:

Air:

Surface water: $t_{1/2} = 31$ h in the water containing killifish and $t_{1/2} = 42$ h for goldfish, so that absorption occurred at similar rates in both fishes (Sasaki et al. 1981).

Groundwater:

Sediment:

Soil:

Biota: biological $t_{1/2} = 1.65$ h (killifish, Sasaki et al. 1982).

15.1.4.4.3 *Tris(2,3-dibromopropyl) phosphate (TDBPP)*

Common Name: Tris(2,3-dibromopropyl) phosphate

Synonym: TDBPP, Tris-BP, 2,3-dibromo-1-propanol phosphate(3:1), phosphoric acid tris(2,3-dibromopropyl) ester, Apex 462-3, Flammex AP, Firemaster: V-T 23P, Fyrol HB 32

Chemical Name:

Use: flame retardant

CAS Registry No: 126-72-7

Molecular Formula: $C_9H_{15}Br_6O_4P$, $(C_3H_5Br_2)_3O_4P$

Molecular Weight: 697.610

Melting Point ($^{\circ}C$):

5.5 (Muir 1984)

viscous liquid (Budavari 1989)

Boiling Point ($^{\circ}C$):

65/0.005 mmHg (Muir 1984)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

8.0 (practical grade, shake flask-nephelometry, Hollifield 1979)

1.60 (Muir 1984)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.0108 (calculated-P/C, Muir 1984)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.98 (HPLC-RT correlation, Veith et al. 1979)

4.39 (Muir 1984)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

0.44 (calculated- K_{OW} , Veith et al. 1979)

Sorption Partition Coefficient, $\log K_{OC}$:

3.76 (calculated- K_{OW} , Muir 1984)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2}$ (calc) = 1.9 d in 1 m deep water system (Muir 1984).

Half-Lives in the Environment:

Surface water: volatilization $t_{1/2}$ (calc) = 1.9 d in 1 m deep water system (Muir 1984).

15.2 SUMMARY TABLES AND QSPR PLOTS

TABLE 15.2.1

Summary of physical properties of esters and phthalate esters

Compound	CAS no.	Molecular formula	Molecular weight, MW g/mol	m.p. °C	b.p. °C	Fugacity ratio, F at 25°C*	Molar volume, V _M	
							cm ³ /mol	
							MW/ρ at 20°C	Le Bas
Aliphatic esters:								
Methyl formate	107-31-3	HCO ₂ CH ₃	60.052	−99	31.7	1	61.64	62.6
Ethyl formate	109-94-4	HCO ₂ C ₂ H ₅	74.079	−79.6	54.4	1	80.35	86.4

TABLE 15.2.3

Suggested half-life classes for esters and phthalate esters in various environmental compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Aliphatic esters:				
Methyl formate	3	3	4	5
Ethyl formate	3	3	4	5
Butyl formate	3	3	4	5
Methyl acetate	3	3	4	5
Vinyl acetate	3	3	4	5
Allyl acetate	3	3	4	5
Ethyl acetate	3	3	4	5
Propyl acetate	3	3	4	5
Butyl acetate	3	3	4	5
Pentyl acetate	3	3	4	5
Methyl methacrylate	2	3	4	5
Phthalate esters:				
Dimethyl phthalate (DMP)	4	5	6	7
Diethyl phthalate (DEP)	4	5	6	7
Di- <i>n</i> -butyl phthalate (DBP)	3	5	6	7
<i>bis</i> (2-Ethylhexyl)-phthalate (DEHP)	3	5	6	7
Butyl benzyl phthalate (BBP)	3	5	6	7

where,

Class	Mean half-life (hours)	Range (hours)
1	5	< 10
2	17 (~ 1 day)	10–30
3	55 (~ 2 days)	30–100
4	170 (~ 1 week)	100–300
5	550 (~ 3 weeks)	300–1,000
6	1700 (~ 2 months)	1,000–3,000
7	5500 (~ 8 months)	3,000–10,000
8	17000 (~ 2 years)	10,000–30,000
9	~ 5 years	> 30,000

16 Nitrogen and Sulfur Compounds

CONTENTS

16.1	List of Chemicals and Data Compilations.	3197
16.1.1	Nitriles (Organic cyanides).	3197
16.1.1.1	Acetonitrile	3197
16.1.1.2	Propionitrile.	3203
16.1.1.3	Butyronitrile	3207
16.1.1.4	Acrylonitrile (2-Propenenitrile)	3210
16.1.1.5	Benzonitrile.	3214
16.1.2	Aliphatic amines	3218
16.1.2.1	Dimethylamine	3218
16.1.2.2	Trimethylamine	3222
16.1.2.3	Ethylamine	3225
16.1.2.4	Diethylamine.	3228
16.1.2.5	<i>n</i> -Propylamine.	3231
16.1.2.6	<i>n</i> -Butylamine.	3234
16.1.2.7	Ethanolamine.	3236
16.1.2.8	Diethanolamine	3239
16.1.2.9	Triethanolamine.	3241
16.1.3	Aromatic amines	3243
16.1.3.1	Aniline.	3243
16.1.3.2	2-Chloroaniline	3249
16.1.3.3	3-Chloroaniline	3253
16.1.3.4	4-Chloroaniline	3257
16.1.3.5	3,4-Dichloroaniline	3261
16.1.3.6	<i>o</i> -Toluidine (2-Methylbenzeneamine).	3263
16.1.3.7	<i>m</i> -Toluidine (3-Methylbenzeneamine)	3267
16.1.3.8	<i>p</i> -Toluidine (4-Methylbenzeneamine).	3270
16.1.3.9	<i>N,N'</i> -Dimethylaniline	3274
16.1.3.10	2,6-Xylidine (2,6-Dimethylbenzeneamine)	3277
16.1.3.11	Diphenylamine	3279
16.1.3.12	Benzidine.	3283
16.1.3.13	3,3'-Dichlorobenzidine	3285
16.1.3.14	<i>N,N'</i> -Bianiline.	3287
16.1.3.15	α -Naphthylamine (1-Aminonaphthalene).	3289
16.1.3.16	β -Naphthylamine (2-Aminonaphthalene).	3291
16.1.3.17	2-Nitroaniline	3293
16.1.3.18	4-Nitroaniline	3295
16.1.4	Nitroaromatic compounds.	3297
16.1.4.1	Nitrobenzene	3297
16.1.4.2	2-Nitrotoluene	3304
16.1.4.3	4-Nitrotoluene	3308
16.1.4.4	2,4-Dinitrotoluene (DNT).	3313

16.1.4.5	2,6-Dinitrotoluene	3317
16.1.4.6	2,4,6-Trinitrotoluene (TNT)	3320
16.1.4.7	1-Nitronaphthalene (α -Nitronaphthalene)	3326
16.1.5	Amides and ureas	3328
16.1.5.1	Acetamide	3328
16.1.5.2	Acrylamide	3330
16.1.5.3	Benzamide	3331
16.1.5.4	Urea	3333
16.1.6	Nitrosamines	3336
16.1.6.1	<i>N</i> -Nitrosodimethylamine	3336
16.1.6.2	<i>N</i> -Nitrosodipropylamine	3338
16.1.6.3	Diphenylnitrosoamine	3340
16.1.7	Heterocyclic compounds	3342
16.1.7.1	Pyrrole	3342
16.1.7.2	Indole	3346
16.1.7.3	Pyridine	3348
16.1.7.4	2-Methylpyridine	3354
16.1.7.5	3-Methylpyridine	3358
16.1.7.6	2,3-Dimethylpyridine	3362
16.1.7.7	Quinoline	3365
16.1.7.8	Isoquinoline	3369
16.1.7.9	Benzo[<i>f</i>]quinoline	3372
16.1.7.10	Carbazole	3375
16.1.7.11	Benzo[<i>c,g</i>]carbazole	3378
16.1.7.12	Acridine	3380

16.1 LIST OF CHEMICALS AND DATA COMPILATIONS

16.1.1 NITRILES (ORGANIC CYANIDES)

16.1.1.1 Acetonitrile

Common Name: Acetonitrile

Synonym: cyanomethane, ethanenitrile, methyl cyanide

Chemical Name: acetonitrile

CAS Registry No: 75-05-8

Molecular Formula: $\text{C}_2\text{H}_3\text{N}$, CH_3CN

Molecular Weight: 41.052

Melting Point ($^{\circ}\text{C}$):

−43.82 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

81.65 (Lide 2003)

Density (g/cm^3 at 20°C):

0.7857 (Dreisbach 1961; Weast 1982–83; Dean 1985)

0.7803 (25°C , Dreisbach 1961)

Molar Volume (cm^3/mol):

52.7 (calculated-density, Rohrschneider 1973)

57.4 (exptl. at normal bp, Lee et al. 1972)

56.3 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK:

29.1 (pK_a , Riddick et al. 1986; Howard 1993)

32.2 (pK_s , Riddick et al. 1986)

−10.12 (pK_{BH^+} , Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

35.01, 31.51 (25°C , bp, Dreisbach 1961)

32.94, 29.82 (25°C , bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

8.167 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C):

$> 3.1 \times 10^6$ (Booth & Everson 1948)

miscible (Dean 1985; Riddick et al. 1986; Yaws et al. 1990; Howard 1993)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

11870* (interpolated-regression of tabulated data, temp range -47 – 81.8°C , Stull 1947)

$\log (P/\text{mmHg}) = 7.12257 - 1315.2/(230 + t/^{\circ}\text{C})$, (Antoine eq., Dreisbach & Martin 1949)

11240 (calculated by formula, Dreisbach 1961)

$\log (P/\text{mmHg}) = 7.07354 - 1279.2/(224.0 + t/^{\circ}\text{C})$, temp range 5 – 119°C , (Antoine eq. for liquid state, Dreisbach 1961)

12156* (25.56°C , measured range 7.3 – 27.38°C , Putnam et al. 1965)

$\log (P/\text{mmHg}) = 7.89511 - 1773.06/(T/\text{K})$; temp range 280 – 300.5 K (Antoine eq., Putnam et al. 1965)

11510 (Hoy 1970)

24459* (41.82°C , ebulliometry, measured range 41 – 82°C , Meyer et al. 1971)

$\log (P/\text{mmHg}) = 6.23655 - 1397.9228/(239.275 + t/^{\circ}\text{C})$; temp range 41 – 82°C (ebulliometry, Meyer et al. 1971)

$\log (P/\text{mmHg}) = [-0.2185 \times 8173.2/(T/\text{K})] + 7.938662$; temp range: -47.0 to 81.8°C , (Antoine eq., Weast 1972–73)

11919* (25.3°C , measured range 15.1 – 89.2°C , Dojcanske & Heinrich 1974)

- 8306* (saturated-vapor volume, extrapolated from fitted Antoine eq., Mousa 1981)
 $\log(P/\text{kPa}) = 6.4914 - 1420.8649/(T/K - 42.15)$; temp range 438.9–530.1 K (ebulliometry, Mousa 1981)
 9864, 15330 (20°C, 30°C, Verschueren 1983)
 11790, 11830 (interpolated values-Antoine equations, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.39532 - 1420.682/(241.852 + t/^\circ\text{C})$, temp range: 15.1–89.2°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 7.54606 - 2093.145/(298.369 + t/^\circ\text{C})$, temp range: 7.26–27.4°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 12310 (calculated-Antoine eq., Dean 1985, 1992)
 $\log(P/\text{mmHg}) = 7.11988 - 1314.4/(230 + t/^\circ\text{C})$, temp range: liquid (Antoine eq., Dean 1985, 1992)
 11840 (Riddick et al. 1986; Howard et al. 1986; quoted, Banerjee et al. 1990; Howard 1993)
 $\log(P/\text{kPa}) = 6.24747 - 1315.2/(230.0 + t/^\circ\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 11800 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.34522 - 1388.446/(-34.856 + T/K)$, temp range: 314–355 K, (Antoine eq., Stephenson & Malanowski 1987)
 11840 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.24724 - 1315.2/(230 + t/^\circ\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log(P/\text{mmHg}) = 23.1953 - 2.3389 \times 10^3/(T/K) - 5.4954 \cdot \log(T/K) + 7.9894 \times 10^{-10} \cdot (T/K) + 2.3293 \times 10^{-6} \cdot (T/K)^2$; temp range 229–546 K (vapor pressure eq., Yaws 1994)
 10604* (22.634°C, comparative ebulliometry, measured range 278–373 K, Ewing & Sanchez Ochoa 2004)
 $\ln(P/\text{kPa}) = 14.7340 - 3268.53/(T/K - 31.615)$, for temp range 290–362 K (comparative ebulliometry, Ewing & Sanchez Ochoa 2004)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated* are compiled at the end of this section):

- 3.50, 2.78 (exptl., calculated-bond contribution, Hine & Mookerjee 1975)
 2.07* (headspace-GC, measured range 0–25°C, Snider & Dawson 1985)
 2.033 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)
 1.474* (20°C, headspace-GC, measured range 6.0–30°C, Benkelberg et al. 1995)
 1.474, 1.477, 1.685 (20°C, headspace-GC, deionized water, rain water, artificial seawater, Benkelberg et al. 1995)
 $\ln(k_H/\text{atm}) = (13.8 \pm 0.3) - (4106 \pm 101)/T/K$, temp range: 6–30°C (headspace-GC measurement, Benkelberg et al. 1995)
 1.55 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 2001)
 $\log K_{AW} = 2.353 - 1627/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)
 2.05 (Ostwald concentration coefficient-concn ratio-GC/FID, Bebahani et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 0.34 (shake flask-GC, Hansch & Anderson 1967; Leo et al. 1969, 1971; Hansch & Leo 1985)
 –0.54 (shake flask-GC, Tani & Hashimoto 1984)
 –0.34 (recommended, Sangster 1989, 1993)
 –0.34 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 2.31 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 0.523 (estimated- K_{OW} as per regression eq of Bysshe 1982, Howard 1993)

Sorption Partition Coefficient, $\log K_{OC}$:

- 0.523 (soil, estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1993)
 –0.714 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

- Volatilization: $t_{1/2} \sim 21$ h from a model river of 1-m deep flowing at 1 m/s with a wind velocity of 3 m/s based on Henry's law constant (Lyman et al. 1982; quoted, Howard 1993)

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

photooxidation $t_{1/2} = 314 - 12559$ yr in water, based on measured rate data for reaction with hydroxyl radical in aqueous solution (Dorfman & Adams 1973; Howard et al. 1991)

$k_{\text{OH}}^* = (4.94 \pm 0.6) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 297.2 K, measured range 297–424 K (flash photolysis-resonance fluorescence, Harris et al. 1981; quoted, Howard 1993)

$k_{\text{OH}}^* = (1.94 \pm 0.37) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 250–363 K (flash photolysis-resonance fluorescence, Kurylo & Knable 1984)

$k_{\text{OH}}^* = (2.1 \pm 0.3) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 295–393 K (discharge flow-EPR, Poulet et al. 1984)

$k_{\text{OH}}(\text{exptl}) = 2.1 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = 2.0 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1985)

$k_{\text{OH}} = 3 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Atkinson 1985; quoted, Howard et al. 1991; Howard 1993)

$k_{\text{OH}} = 1.90 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $k(\text{soln}) = 3.70 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with hydroxyl radical in aqueous solution (Wallington et al. 1988)

$k_{\text{OH}}^* = 2.14 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Hydrolysis:

$k = 5.8 \times 10^{-3} \text{ M}^{-1} \text{ h}^{-1}$ at pH 7 and 25°C with $t_{1/2} > 150000$ yr (Ellington et al. 1987)

$k_{\text{O}_3}(\text{aq.}) \leq 6 \times 10^{-5} \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C, with $t_{1/2} \geq 18$ yr at pH 7 (Yao & Haag 1991).

Biodegradation: $t_{1/2}(\text{aq. aerobic}) = 168 - 672$ h, based on aerobic river die-away test data (Ludzack et al. 1958; quoted, Howard et al. 1991); $t_{1/2}(\text{aq. anaerobic}) = 672 - 2688$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 1299 - 12991$ h, based on measured rate constant $k = 3 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor phase reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991; Howard 1993);

atmospheric transformation lifetime was estimated to be > 5 d (Kelly et al. 1994).

Surface water: $t_{1/2} = 168 - 672$ h, based on aerobic river die-away test data (Howard et al. 1991);

photooxidation $t_{1/2} = 314 - 12559$ yr, based on measured rate data for reaction with hydroxyl radical in aqueous solution (Dorfman & Adams 1973; Howard et al. 1991);

$t_{1/2} \geq 18$ yr for direct reaction with ozone in water at pH 7 and 22°C (Yao & Haag 1991).

Groundwater: $t_{1/2} = 336 - 8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 168 - 672$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

TABLE 16.1.1.1

Reported vapor pressures of acetonitrile at various temperatures and the coefficients for the vapor pressure equations

$\log P = A - B/(T/K)$	(1)	$\ln P = A - B/(T/K)$	(1a)
$\log P = A - B/(C + t/^{\circ}\text{C})$	(2)	$\ln P = A - B/(C + t/^{\circ}\text{C})$	(2a)
$\log P = A - B/(C + T/K)$	(3)		
$\log P = A - B/(T/K) - C \cdot \log (T/K)$	(4)

16.1.1.2 Propionitrile

Common Name: Propionitrile

Synonym: propanenitrile, ethyl cyanide, cyanoethane, propyl nitrile

Chemical Name: propionitrile

CAS Registry No: 107-12-0

Molecular Formula: C_3H_5N , CH_3CH_2CN

Molecular Weight: 55.079

Melting Point ($^{\circ}C$):

−92.78 (Lide 2003)

Boiling Point ($^{\circ}C$):

97.14 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.7818 (Weast 1982–83; Dean 1985)

0.78182, 0.77682 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

70.4 (calculated-density, Taft et al. 1985; Leahy 1986; Kamlet et al. 1986, 1987)

78.5 (calculated-Le Bas method at normal boiling point)

Dissociation Constant:

33.54 (pK_s , Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_{vap} (kJ/mol):

37.41, 32.77 ($25^{\circ}C$, bp, Dreisbach 1961)

36.03, 30.96 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.045 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

104950 (Seidell 1941)

105200 (Hansch et al. 1968)

103000 (Dean 1985; Riddick et al. 1986; Howard 1990)

55000, 65000 ($20^{\circ}C$, $30^{\circ}C$, shake flask-GC, measured range 0 – $90^{\circ}C$, Stephenson 1994)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

6005* (interpolated-regression of tabulated data, temp range -35 – $97.1^{\circ}C$, Stull 1947)

10114* ($35.5^{\circ}C$, ebulliometry, measured range 35.5 – $97.35^{\circ}C$, Dreisbach & Shrader 1949)

$\log (P/mmHg) = 7.15217 - 1398.2/(230 + t/^{\circ}C)$; temp range 35.5 – $97.35^{\circ}C$, (Antoine eq., Dreisbach & Martin 1949)

5333* ($22.05^{\circ}C$, measured range -84.66 – $22.05^{\circ}C$, Milazzo 1956)

5950 (calculated by formula, Dreisbach 1961)

$\log (P/mmHg) = 7.05846 - 1327.9/(221.0 + t/^{\circ}C)$, temp range: 17 – $137^{\circ}C$, (Antoine eq. for liquid state, Dreisbach 1961)

$\log (P/mmHg) = [-0.2185 \times 8769.0/(T/K)] + 8.079473$; temp range: -35 to $97.1^{\circ}C$, (Antoine eq., Weast 1972–73)

6140 ($22.05^{\circ}C$, quoted exptl., Boublik et al. 1973, 1984)

6163, 6143 (extrapolated values-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 5.89149 - 1181.562/(206.603 + t/^{\circ}C)$, temp range: 35.5 – $97.39^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/kPa) = 4.43918 - 677.415/(160.551 + t/^{\circ}C)$, temp range: -84.7 to $22.05^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

6140 (extrapolated-Antoine eq., Dean 1985, 1992)
 $\log(P/\text{mmHg}) = 5.2782 - 665.52/(159.0 + t/^{\circ}\text{C})$, temp range: -84 to 22°C (Antoine eq., Dean 1985, 1992)
 5950 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.27702 - 1398.2/(230 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log(P/\text{kPa}) = 7.15190 - 1894.10/(T/\text{K})$; temp range: 9 – 25°C , (Antoine eq., Riddick et al. 1986)
 6306 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 7.395 - 3213/(T/\text{K})$, temp range: 357 – 413 K, (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 10.31055 - 3994.667/(T/\text{K})$, temp range: 373 – 413 K, (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P/\text{mmHg}) = 33.7908 - 2.9113 \times 10^3/(T/\text{K}) - 9.1506 \cdot \log(T/\text{K}) + 1.1173 \times 10^{-11} \cdot (T/\text{K}) + 3.2756 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 180 – 564 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

3.800 (partial pressure, Butler & Ramchandani 1935)
 3.748 (partial vapor pressure-GC, Buttery et al. 1969)
 3.752, 3.752, 4.114 (exptl., calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 5.947 (Howard 1990)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.041 (shake flask, Collander 1951)
 0.16 (shake flask-GC, Hansch & Anderson 1967; Hansch et al. 1968)
 -0.10 (shake flask-GC, Tani & Hashimoto 1984)
 0.16 (recommended, Sangster 1989, 1993)
 0.16 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

2.69 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

-0.108 (estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

0.079 (soil, estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} = 13.3$ h was estimated for a model river 1 m deep flowing 1 m/s with wind speed 3 m/s (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{\text{OH}}^* = (1.94 \pm 0.20) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298.2 K, measured range 298 – 423 K (flash photolysis-resonance fluorescence, Harris et al. 1981)

$k_{\text{OH}} = 1.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1985)

$k_{\text{OH}} = 1.94 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298.2 K, $k(\text{soln}) = 1.60 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the solution-phase reaction with hydroxyl radical in aqueous solution (Wallington et al. 1988)

photooxidation $t_{1/2} = 83$ d in air, based on experimental rate constant assuming $t_{1/2} = 12$ h of sunlight for the vapor-phase reaction with hydroxyl radical in air and $t_{1/2} > 100$ d for the reaction with ozone in the atmosphere (Howard 1990)

$k_{\text{OH}} = 0.194 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298.2 K (review, Atkinson 1989)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 83$ d, based on experimental rate constant assuming 12 h of sunlight for the vapor-phase reaction with hydroxyl radical in air and $t_{1/2} > 100$ d for the reaction with ozone in the atmosphere (Harris et al. 1981; quoted, Howard 1990).

TABLE 16.1.1.2.1**Reported aqueous solubilities and vapor pressures of propionitrile at various temperatures**

16.1.1.3 Butyronitrile

Common Name: *n*-Butyronitrile

Synonym: butanenitrile

Chemical Name: butyronitrile

CAS Registry No: 109-74-0

Molecular Formula: C_4H_7N , $CH_3CH_2CH_2CN$

Molecular Weight: 69.106

Melting Point ($^{\circ}C$):

−111.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

117.6 (Lide 2003)

Density (g/cm^3):

0.7911, 0.7865 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Dissociation Constant, pK_a :

Molar Volume (cm^3/mol):

88.4 ($30^{\circ}C$, Stephenson & Malanowski 1987)

100.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

39.33, 34.43 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.021 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Other data at other temperatures designated * are compiled at the end of this section):

33000 (selected, Riddick et al. 1986)

33500* ($20^{\circ}C$, shake flask-GC/TC, measured range 0 – $90^{\circ}C$, Stephenson 1994)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and the reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1333* ($25.7^{\circ}C$, summary of literature data, temp range -20 to $117.5^{\circ}C$, Stull 1947)

3592* ($30.64^{\circ}C$, ebulliometry, measured range 30.64 – $120.223^{\circ}C$, Meyer et al. 1971)

$\log (P/mmHg) = 6.771124 - 1444.5851/(t/^{\circ}C + 223.275)$; temp range 30.64 – $120.223^{\circ}C$ (Antoine eq., ebulliometric measurements, Meyer et al. 1971)

13831* ($59.807^{\circ}C$, ebulliometry, measured range 59.807 – $127.707^{\circ}C$, Meyer & Hotz 1976)

2546 (selected, Riddick et al. 1986)

$\log (P/kPa) = 6.25390 - 1452.076/(t/^{\circ}C + 224.1855)$; temp range not specified (Riddick et al. 1986)

$\log (P_L/kPa) = 6.25397 - 1452.076/(-46.9645 + T/K)$; temp range 332 – $401\ K$ (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/mmHg) = 4.8780 - 2.5505 \times 10^3/(T/K) + 3.6306 \cdot \log (T/K) - 1.663 \times 10^{-2} \cdot (T/K) + 1.0604 \times 10^{-5} \cdot (T/K)^2$; temp range 161 – $582\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

0.53 (shake flask-GC, Tani & Hashimoto 1984)

0.53 (recommended, Sangster 1993; Hansch et al. 1995)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

16.1.1.4 Acrylonitrile (2-Propenenitrile)

Common Name: Acrylonitrile

Synonym: cyanoethylene, propenenitrile, 2-propenenitrile, vinyl cyanide

Chemical Name: acrylonitrile, cyanoethylene

CAS Registry No: 107-13-1

Molecular Formula: C_3H_3N , $CH_2=CHCN$

Molecular Weight: 53.063

Melting Point ($^{\circ}C$):

-83.48 (Lide 2003)

Boiling Point ($^{\circ}C$):

77.30 (Riddick et al. 1986; Howard 1989; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8060, 0.8004 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

65.8 ($20^{\circ}C$, calculated-density)

71.1 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

6.230 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

79000 (Klein et al. 1957)

75000 (Günther et al. 1968)

73500 ($20^{\circ}C$, Windholz 1976)

73240 (shake flask-LSC, Veith et al. 1980)

7.35 wt%* ($20^{\circ}C$, Kirk-Othmer Encyclopedia 3rd ed., measured range 0 – $60^{\circ}C$, quoted, Basu et al. 1983)

73500 ($20^{\circ}C$, Riddick et al. 1986)

69000*, 66400 ($20^{\circ}C$, $30^{\circ}C$, shake flask-GC, measured range 0 – $70^{\circ}C$, Stephenson 1994)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

14340* (interpolated-regression of tabulated data, temp range -51 to $78.5^{\circ}C$, Stull 1947)

11732* ($20^{\circ}C$, temp range 20 – $77^{\circ}C$, Gudkov et al. 1964; quoted, Boublik et al. 1984)

14100 (Hoy 1970)

$\log(P/mmHg) = [-0.2185 \times 7941.4/(T/K)] + 7.851016$; temp range: -51 to $78.5^{\circ}C$, (Antoine eq., Weast 1972–73)

14720 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 4.77668 - 649.583/(155.006 + t/^{\circ}C)$, temp range 20 – $70^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

14370 (Daubert & Danner 1985)

15240 (calculated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 7.03855 - 1232.53/(222.47 + t/^{\circ}C)$, temp range -20 to $140^{\circ}C$ (Antoine eq., Dean 1985, 1992)

11000 ($20^{\circ}C$, Riddick et al. 1986)

$\log(P/kPa) = 6.643 - 11644.7/(T/K)$, temp range not specified (Antoine eq., Riddick et al. 1986)

14560 (interpolated-Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.12021 - 1288.9/(-38.74 + T/K)$; temp range 257 – 352 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.4811 - 1518.381/(-12.003 + T/K)$; temp range 283 – 343 K (Antoine eq.-II, Stephenson & Malanowski 1987)

15600 (calculated-solvatochromic parameters, Banerjee et al. 1990)

$\log (P/\text{mmHg}) = 35.921 - 2.7763 \times 10^3/(T/K) - 10.101 \cdot \log (T/K) - 3.1547 \times 10^{-10} \cdot (T/K) + 4.7299 \times 10^{-6} \cdot (T/K)^2$;
temp range 190–535 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

11.14 (Bocek 1976; quoted, Basu et al. 1983; Howard 1989)

8.918 (calculated-P/C, Mabey et al. 1982)

9.420 (quoted, WERL Treatability Database, Ryan et al. 1988)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.25 (shake flask-HPLC, Pratesi et al. 1979)

0.00 (shake flask, Fujisawa & Masuhara 1980, 1981)

0.09 (shake flask-GC, Tani & Hashimoto 1984)

0.25 (Hansch & Leo 1985)

0.25 (recommended, Sangster 1989)

0.25 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

1.68 (bluegill sunfish, Barrows et al. 1978)

0.00 (estimated-S, Kenaga 1980)

1.68, 0.32 (bluegill sunfish, calculated- K_{OW} , Veith et al. 1980)

0.017 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

0.954 (soil, calculated-S, Kenaga 1980)

−0.071 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

1.101, 1.006; 1.09 (Captina silt loam, McLaurin sandy loam; weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)

−0.0899 (calculated- K_{OW} , Walton et al. 1992)

−0.0890 (calculated- K_{OW} , Kolig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 6, 1.2, 4.8$ d in a typical pond, river and lake are 6, 1.2, and 4.8 d, respectively, with the reaeration for oxygen in typical bodies of water (Lyman et al. 1982; quoted, Howard 1989)

evaporation $t_{1/2} = 795$ min from water with an assumed 1-m depth (Basu et al. 1983).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k < 1 \times 10^8 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen, and $36 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

$t_{1/2} = 4.0$ h for photooxidation in the troposphere (Callahan et al. 1979)

$k_{OH} = (40.6 \pm 4.1) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 299 K (flash photolysis-resonance fluorescence technique, Harris et al. 1981)

$k_{O_3} < 1 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K, and tropospheric lifetimes, $\tau > 115$ d and $\tau = 3$ d due to reactions with O_3 and OH radical, respectively (Atkinson et al. 1982)

$k_{O_3} < 1 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K (Atkinson et al. 1983; quoted, Atkinson & Carter 1984)

$t_{1/2} = 3.5$ d for the reaction with photochemically produced hydroxyl radical by the sunlight (Edney et al. 1983; quoted, Howard 1989)

$k_{OH} = 4.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298.7 K, and $k_{OH} = 3.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (review, flash photolysis-resonance fluorescence technique Atkinson 1985)

photooxidation $t_{1/2} = 3.4\text{--}189$ h, based on measured rate constant for the reaction with hydroxyl radical in air (Howard et al. 1991)

$k_{OH} = (3.4 - 4.80) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296–298.2 K (review, Atkinson 1989)

Hydrolysis: $k(\text{acid}) = 4.2 \times 10^{-2} \text{ M}^{-1} \text{ h}^{-1}$ at pH 5.0 with $t_{1/2} = 188 \text{ yr}$ and $k(\text{base}) = 6.1 \times 10^{-2} \text{ M}^{-1} \text{ h}^{-1}$ at pH 9.0 with $t_{1/2} = 13 \text{ yr}$ (Ellington et al. 1987; quoted, Howard et al. 1991, Kollig 1993);
 $t_{1/2} = 1210 \text{ yr}$ at pH 7.0, based on measured acid and base catalyzed hydrolysis constants (Ellington et al. 1987; quoted, Howard et al. 1991)
 $t_{1/2} = 69 \text{ d}$ at pH 2, $t_{1/2} = 440000 \text{ d}$ at pH 7 and $t_{1/2} = 4.7 \text{ d}$ at pH 12 in natural waters (Capel & Larson 1995).
 Biodegradation: $t_{1/2}(\text{aq. aerobic}) = 30\text{--}552 \text{ h}$, based on river die-away test data (Going et al. 1979; Ludzack et al. 1958; quoted, Howard et al. 1991); $t_{1/2}(\text{aq. anaerobic}) = 120\text{--}2208 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)
 ^{14}C labeled acrylonitrile at concentrations up to 100 ppm was completely degraded within 2.0 d in a London soil under aerobic conditions (Donberg et al. 1992)
 $t_{1/2}(\text{aerobic}) = 1.3 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 5 \text{ d}$ in natural waters (Capel & Larson 1995)
 Biotransformation: $k = \text{of } 3 \times 10^{-9} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacterial transformation in water (Mabey et al. 1982).
 Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 4.0 \text{ h}$ for photooxidation in the troposphere (Callahan et al. 1979);
 $t_{1/2} = 3.5 \text{ d}$ for the reaction with photochemically produced hydroxyl radical by the sunlight (Edney et al. 1983; quoted, Howard 1989);
 photooxidation $t_{1/2} = 13.4\text{--}189 \text{ h}$, based on measured rate constant for the reaction with hydroxyl radicals in air (Atkinson 1985; quoted, Howard et al. 1991);
 atmospheric transformation lifetime was estimated to be 1 – 5 to > 5 d (Kelly et al. 1994).
 Surface water: $t_{1/2} = 30\text{--}552 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)
 Biodegradation $t_{1/2}(\text{aerobic}) = 100 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 400 \text{ d}$; hydrolysis $t_{1/2} = 69 \text{ d}$ at pH 2, $t_{1/2} = 440000 \text{ d}$ at pH 7 and $t_{1/2} = 4.7 \text{ d}$ at pH 12 in natural waters (Capel & Larson 1995).
 Groundwater: $t_{1/2} = 60\text{--}1104 \text{ h}$ based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).
 Sediment:
 Soil: $t_{1/2} < 10 \text{ d}$ in soil (USEPA 1979; quoted, Ryan et al. 1988);
 $t_{1/2} = 30\text{--}552 \text{ h}$ based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

16.1.1.5 Benzonitrile

Common Name: Benzonitrile

Synonym: benzenecarbonitrile, cyanobenzene, phenyl cyanide

Chemical Name: benzonitrile, benzoic acid nitrile

CAS Registry No: 100-47-0

Molecular Formula: C_6H_5CN

Molecular Weight: 103.122

Melting Point ($^{\circ}C$):

-13.99 (Lide 2003)

Boiling Point ($^{\circ}C$):

191.1 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0006 ($25^{\circ}C$, Dean 1985; Riddick et al. 1986)

Molar Volume (cm^3/mol):

103.1 ($25^{\circ}C$, calculated-density)

107.9 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

55.48, 45.94 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.88 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

4330 (shake flask-UV, McGowan et al. 1966)

2000 (Dean 1985; Riddick et al. 1986)

10000 (selected, Yaws et al. 1990)

4000* (shake flask-GC/TC, measured range $0-90^{\circ}C$, Stephenson 1994)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($38.4^{\circ}C$, static method, measured range $38.4-190.6^{\circ}C$, Kahlbaum 1898)

133.3* ($28.2^{\circ}C$, summary of literature data, temp range $28.2-190.6^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 11341.0/(T/K)] + 8.239760$; temp range: $28.2-190.6^{\circ}C$ (Antoine eq., Weast 1972-73)

78.86 (calculated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 6.74631 - 1436.72/(181 + t/^{\circ}C)$, temp range: liquid (Antoine eq., Dean 1985, 1992)

100.0 (Riddick et al. 1986)

$\log(P/kPa) = 5.87121 - 1436.72/(181.0 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

106.0 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.79506 - 2066.71/(-32.19 + T/K)$, temp range $301-464 K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

55.32 (computed-vapor-liquid equilibrium VLE data, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.56 (shake flask-UV spectrophotometry, Fujita et al. 1964; quoted, Leo et al. 1969; Hansch & Leo 1979)

1.56 (shake flask-UV, Holmes & Lough 1976)

1.67	(calculated-fragment const., Rekker 1977)
1.56	(shake flask at pH 7, Unger et al. 1978)
1.66	(RP-HPLC- k' correlation, Miyake & Terada 1982)
1.65 \pm 0.01	(HPLC-RV correlation-ALPM, Garst & Wilson 1984)
1.50	(HPLC- k' correlation, Haky & Young 1984)
1.56	(shake flask-GC, Tanii & Hashimoto 1984)
1.56	(RP-HPLC-capacity ratio, Minick et al. 1988)
1.45	(RP-HPLC-RT correlation, ODS column with masking agent, Bechalany et al. 1989)
1.56	(recommended, Sangster 1989, 1993)
1.56	(shake flask-GC, Alcorn et al. 1993)
1.56	(recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

4.46	(head-space GC, Abraham et al. 2001)
------	--------------------------------------

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k ; for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 3.3 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Zetzsch 1982; Atkinson 1989)

$k_{OH}(\text{calc}) = 4.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

$k_{OH}(\text{calc}) = 3.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1985)

$k_{OH}(\text{calc}) = 3.6 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs}) = 3.3 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}(\text{calc}) = 4.1 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Surface water: an estimated $t_{1/2} = 1.3 \text{ d}$ in Rhine River in case of first order reduction process (Zoeteman et al. 1980)

16.1.2 ALIPHATIC AMINES

16.1.2.1 Dimethylamine

Common Name: Dimethylamine

Synonym: aminomethylmethane, N-methylmethanamine

Chemical Name: aminomethylmethane, dimethylamine

CAS Registry No: 124-40-3

Molecular Formula: C_2H_7N , CH_3NHCH_3

Molecular Weight: 45.084

Melting Point ($^{\circ}C$):

-92.18 (Lide 2003)

Boiling Point ($^{\circ}C$):

6.88 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.6804 ($0^{\circ}C$, Weast 1982-83)

0.6556, 0.6496 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

68.8 ($20^{\circ}C$, calculated-density)

67.5 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

10.732 (Perrin 1965; Weast 1982-83; Howard 1990)

10.77 (protonated cation + 1, Dean 1985)

10.77 (Sangster 1989)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

23.84, 24.61 ($25^{\circ}C$, bp, Dreisbach 1961)

23.65, 24.61 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.941 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

very soluble (Dean 1985)

620000 (selected, Yaws et al. 1990)

miscible (Stephenson 1993b)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

101141* ($280.018 K$, static method, measured range $201.387-280.018 K$, Ashton et al. 1939)

236420* (extrapolated-regression of tabulated data, temp range -87.2 to $+7.4^{\circ}C$, Stull 1947)

196800 (calculated by formula, Dreisbach 1961)

$\log (P/mmHg) = 7.06396 - 1024.4/(238.0 + t/^{\circ}C)$, temp range -55 to $37^{\circ}C$, (Antoine eq. for liquid state, Dreisbach 1961)

$\log (P/mmHg) = [-0.2185 \times 6660.0/(T/K)] + 7.995166$; temp range -87.7 to $162.6^{\circ}C$, (Antoine eq., Weast 1972-73)

172220 ($20^{\circ}C$, Verschueren 1983)

206180 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.21132 - 962.001/(221.852 + t/^{\circ}C)$, temp range -71.77 to $6.858^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

202620 (Daubert & Danner 1985)

206000 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log (P/mmHg) = 7.08212 - 960.242/(221.67 + t/^{\circ}C)$, temp range -72 to $6^{\circ}C$ (Antoine eq., Dean 1985, 1992)

196800 (quoted lit., Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.18886 - 1.024.40/(238.0 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)

205300 (interpolated-Antoine eq.-II., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.29031 - 993.586/(-48.12 + T/\text{K})$, temp range 201–280 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.20646 - 965.728/(-50.151 + T/\text{K})$, temp range 277–360 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 7.81489 - 2369.425/(141.433 + T/\text{K})$, temp range 358–438 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 36.9182 - 2.4965 \times 10^3/(T/\text{K}) - 10.417 \cdot \log (T/\text{K}) - 1.6287 \times 10^{-9} \cdot (T/\text{K}) + 4.6496 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 181–438 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

1.796 (exptl., Hine & Mookerjee 1975; quoted, Howard 1990)

1.796, 1.03 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

2.718 (calculated-molecular structure, Russell et al. 1992)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

−0.38 (shake flask-RC at pH 13, Wolfenden 1978)

−0.38 (Hansch & Leo 1985)

−0.38 (recommended, Sangster 1989; 1993)

−0.38 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

2.00 (calculated- S_{oct} and vapor pressure P , Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

−0.523 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

2.638 (adsorption isotherm average for five soils, Rao & Davidson 1982; quoted, Howard 1990)

0.602; 2.212; 2.706 (Podzol soil; Alfisol soil; sediment, von Oepen et al. 1991)

2.63 (soil, calculated-MCI, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} = 35.1$ h was estimated for a model river of 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1982; selected, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated:

$k_{OH} = 6.54 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 299 K (Atkinson et al. 1977; quoted, Carlier et al. 1986; Atkinson 1989)

photooxidation $t_{1/2} = 5.9$ h in air was estimated for the vapor phase reaction with hydroxyl radical of 5×10^5 radicals/ cm^3 in air (Atkinson et al. 1978; Atkinson 1985; quoted, Howard 1990);

$k_{O_3} = (2.61 \pm 0.30) \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K (Atkinson & Carter 1984; quoted, Atkinson 1985)

$k_{OH} = 6.5 \times 10^{-11} \text{ cm}^3 \pm \text{molecule}^{-1} \text{ s}^{-1}$ for the gas-phase reaction with 5×10^5 OH radicals/ cm^3 at room temp. having a loss rate of 2.8 d^{-1} (Atkinson 1985)

$k_{OH}(\text{calc}) = 63 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1987).

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 2\text{--}79$ h, based on river die-away test data (Digeronimo et al. 1979; Dojlido 1979; selected, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 8\text{--}316$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 5.9$ h was estimated for the vapor phase reaction with hydroxyl radical of 5×10^5 radicals/cm³ in air (Atkinson et al. 1978; Atkinson 1985; quoted, Howard 1990);

photooxidation $t_{1/2} = 0.892\text{--}9.20$ h, based on measured rate constant for the gas-phase reaction with OH radical (Atkinson 1985; quoted, Howard et al. 1991) and ozone (Tuazon et al. 1978; selected, Howard et al. 1991).

Surface water: $t_{1/2} = 2\text{--}79$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 4\text{--}158$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 86\text{--}336$ h, based on soil die-away test data (Tate & Alexander 1976; Greene et al. 1981; selected, Howard et al. 1991).

Biota:

TABLE 16.1.2.1.1

16.1.2.2 Trimethylamine

Common Name: Trimethylamine

Synonym: dimethylamino methane, TMA

Chemical Name: trimethylamine

CAS Registry No: 75-50-3

Molecular Formula: C_3H_9N , $CH_3N(CH_3)_2$

Molecular Weight: 59.110

Melting Point ($^{\circ}C$):

-117.1 (Lide 2003)

Boiling Point ($^{\circ}C$):

2.87 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.6356 (Weast 1982–83)

Molar Volume (cm^3/mol):

93 ($20^{\circ}C$, calculated-density)

93.3 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

9.801, 9.987 (Perrin 1972; quoted, Howard 1990)

9.80 (pK_a , protonated cation + 1, Dean 1985)

9.79 (pK_a , Sangster 1989)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

22.85, 24.13 ($25^{\circ}C$, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$) or as indicated:

410000 (Dean 1985)

890000 ($30^{\circ}C$, Howard 1990)

291000 (selected, Yaws et al. 1990)

miscible (Stephenson 1993b)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this chapter):

221715* (isoteniscope, measured range 0 – $40^{\circ}C$, Swift & Hochanadel 1945)

$\log (P/mmHg) = 24.91300 - 2018.37/(T/K) - 6.0303 \cdot \log (T/K)$; temp range 0 – $40^{\circ}C$ (isoteniscope method, Swift & Hochanadel 1945)

265200* (extrapolated-regression of tabulated data, temp range -97.1 to $+2.9^{\circ}C$, Stull 1947)

226540 (calculated by formula, Dreisbach 1961)

$\log (P/mmHg) = 6.97038 - 968.7/(234.0 + t/^{\circ}C)$, temp range -58 to $32^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log (P/mmHg) = [-0.2185 \times 6361.7/(T/K)] + 7.952370$; temp range -97.1 to $2.9^{\circ}C$ (Antoine eq., Weast 1972–73)

192500 ($20^{\circ}C$, $30^{\circ}C$, Verschuereen 1983)

219300, 221800 (extrapolated-Antoine eq., interpolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 5.98554 - 1957.276/(237.664 + t/^{\circ}C)$, temp range -80.3 to $3.45^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/kPa) = 5.87712 - 894.366/(228.276 + t/^{\circ}C)$, temp range 0 – $40^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

214200 (Daubert & Danner 1985)

219000 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log (P/mmHg) = 6.85755 - 955.94/(237.52 + t/^{\circ}C)$, temp range -80 to $3^{\circ}C$ (Antoine eq., Dean 1985, 1992)

219900 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.01402 - 968.978/(-34.253 + T/\text{K})$, temp range 192–277 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 58.6807 - 2.686 \times 10^3/(T/\text{K}) - 20.36 \cdot \log (T/\text{K}) + 1.3131 \times 10^{-2} \cdot (T/\text{K}) - 6.563 \times 10^{-13} \cdot (T/\text{K})^2$; temp range 156–433 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

6.672 (exptl., Hine & Mookerjee 1975)

12.71, 2.16 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

15.64 (calculated-molecular structure, Russell et al. 1992)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.27 (shake flask-TN, Sandell 1962; quoted, Leo et al. 1971)

0.27; 0.20 (calculated-f const., calculated- π const., Rekker 1977)

0.16 (shake flask, Hansch & Leo 1985)

0.16 (recommended, Sangster 1989)

0.16 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

< 0.0 (estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

1.462 (soil, estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

0.602 (soil, estimated-solubility, Lyman et al. 1982; quoted, Howard 1990)

0.778; 2.365; 2.831 (Podzol soil; Alfisol soil; sediments von Oepen et al. 1991)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} = 11$ h was estimated for a model river 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 6.09 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 299 K (Atkinson et al. 1977; Atkinson 1989)

photooxidation $t_{1/2} = 62$ d in water, based on rate constant $k = 1.3 \times 10^{10} \text{ L mol}^{-1} \text{ s}^{-1}$ for the reaction with photochemically produced hydroxyl radicals of $1 \times 10^{-17} \text{ mol} \cdot \text{L}^{-1}$ in water (Mill et al. 1980; Güesten et al. 1981; quoted, Howard 1990)

$k_{OH} = 6.10 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the gas-phase reaction with $1 \times 10^6 \text{ OH radicals/cm}^3$ with a loss rate of 5.0 d^{-1} and rate constant $k_{O_3} = 9.70 \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the gas-phase reaction with $7 \times 10^{11} \text{ O}_3 \text{ molecules/cm}^3$ with a loss rate of 0.6 d^{-1} both at room temp. (Atkinson & Carter 1984)

calculated $k_{OH} = 64 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 4.0$ h, based on rate constant $k = 6.09 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with photochemically produced hydroxyl radical of $8 \times 10^5 \text{ radicals/cm}^3$ in air at 25.5°C and $t_{1/2} = 1.4$ d, based on rate constant $k = 9.73 \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with ozone of $6 \times 10^{11} \text{ molecules/cm}^3$ in air at 24.4°C (Atkinson 1985; GEMS 1986; quoted, Howard 1990).

Surface water: $t_{1/2} = 62$ d, based on rate constant $k = 1.3 \times 10^{10} \text{ L mol}^{-1} \text{ s}^{-1}$ for the reaction with photochemically produced hydroxyl radicals of $1 \times 10^{-17} \text{ mol L}^{-1}$ in water (Mill et al. 1980; Güesten et al. 1981; quoted, Howard 1990).

16.1.2.3 Ethylamine

Common Name: Ethylamine

Synonym: aminoethane, ethanamine, monoethylamine

Chemical Name: aminoethane, ethylamine

CAS Registry No: 75-04-7

Molecular Formula: C_2H_7N , $CH_3CH_2NH_2$

Molecular Weight: 45.084

Melting Point ($^{\circ}C$):

−80.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

16.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.6829 (Dreisbach 1961; Weast 1982–83)

0.6769 ($25^{\circ}C$, Dreisbach 1961)

Molar Volume (cm^3/mol):

65.4 ($5^{\circ}C$, Stephenson & Malanowski 1987)

66.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

10.79 (Perrin 1972)

10.81 ($20^{\circ}C$, Weast 1982–83)

10.63 (protonated cation + 1, Dean 1985)

10.70 (Sangster 1989)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

27.08, 27.57 ($25^{\circ}C$, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Dean 1985; Howard 1990; Stephenson 1993b)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated* are compiled at the end of this section):

156200* (extrapolated-regression of tabulated data, temp range -82.3 to $16.6^{\circ}C$, Stull 1947)

141620 (calculated by formula, Dreisbach 1961)

$\log (P/mmHg) = 7.3862 - 1137.30/(235.85 + t/^{\circ}C)$; temp range -43 to $47^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

93325* ($20^{\circ}C$, temp range 1.95 to $20^{\circ}C$, Bittrich et al. 1962)

$\log (P/mmHg) = [-0.2185 \times 6845.1/(T/K)] + 7.973674$; temp range -82.3 to $176^{\circ}C$, (Antoine eq., Weast 1972–73)

121570, 172220 ($20^{\circ}C$, $30^{\circ}C$, Verschuereen 1983)

139100 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 5.12561 - 559.427/(162.579 + t/^{\circ}C)$; temp range 1.95 – $14.65^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

139700 (Daubert & Danner 1985)

141000 (calculated-Antoine eq., Dean 1985, 1992)

$\log (P/mmHg) = 7.05413 - 987.31/(220.0 + t/^{\circ}C)$; temp range -20 to $90^{\circ}C$ (Antoine eq., Dean 1985, 1992)

137500, 141200 (calculated-Antoine eq.-II, III, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.57462 - 1167.57/(-34.18 + T/K)$; temp range 213 – $297 K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.43082 - 1140.62/(-32.433 + T/K)$; temp range 290 – $449 K$ (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.21526 - 1009.66/(-49.804 + T/\text{K})$; temp range 291–367 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.48782 - 1176.995/(-26.674 + T/\text{K})$; temp range 377–456 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

140900 (calculated-Cox eq., Chao et al. 1990)

$\log (P/\text{mmHg}) = 33.2962 - 2.4307 \times 10^3/(T/\text{K}) - 9.0779 \cdot \log (T/\text{K}) - 1.3848 \times 10^{-9} \cdot (T/\text{K}) + 3.8183 \times 10^{-6} \cdot (T/\text{K})^2$;
temp range 192–456 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

1.012 (partial pressure, Butler & Ramchandani 1935)

0.683 (exptl., Hine & Mookerjee 1975)

0.859, 0.730 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

0.421 (calculated-molecular structure, Russell et al. 1992)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

−0.30 (shake flask-titration with ion correction, Korenman et al. 1973)

−0.16, −0.14; −0.19 (calculated-fragment const.; calculated- π const., Rekker 1977)

−0.13 (Hansch & Leo 1985)

−0.13 (recommended, Sangster 1989)

−0.14 (calculated-CLOGP, Jäkel & Klein 1991)

−0.13 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

< 0.0 (estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} = 2.0$ d was estimated for a model river of 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s (Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} > 9.9$ d for the gas-phase reaction with OH radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976)

$k_{OH} = 2.77 \times 10^{-11} \text{ cm}^3 \cdot \text{molecules}^{-1} \cdot \text{s}^{-1}$ at 299 K (Atkinson et al. 1977; quoted, Carlier et al. 1986)

photooxidation $t_{1/2} = 321$ d in water, based on a rate constant $k = 2.5 \times 10^9 \text{ L} \cdot \text{mol}^{-1} \cdot \text{s}^{-1}$ for the aqueous-phase reaction with photochemically produced OH radical of $1 \times 10^{-17} \text{ mol} \cdot \text{L}^{-1}$ (Mill et al. 1980; Güesten et al. 1981; quoted, Howard 1990)

$k_{O_3} = (2.76 \pm 0.34) \times 10^{-20} \text{ cm}^3 \cdot \text{molecules}^{-1} \cdot \text{s}^{-1}$ at 296 ± 2 K under atmospheric conditions (Atkinson & Carter 1984)

$k_{OH} = 27.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 299.6 K (Atkinson 1989)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} > 9.9$ d for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

photooxidation $t_{1/2} = 8.6$ h, based on rate constant $k = 6.54 \times 10^{-11} \text{ cm}^3 \cdot \text{molecules}^{-1} \cdot \text{s}^{-1}$ for the vapor-phase reaction with an average hydroxyl radical of $5 \times 10^5 \text{ radicals/cm}^3$ at 25.5°C (Atkinson 1985; quoted, Howard 1990).

Surface water: $t_{1/2} = 321$ d, based on a rate constant $k = 2.5 \times 10^9 \text{ L}\cdot\text{mol}^{-1}\cdot\text{s}^{-1}$ for the aqueous-phase reaction with photochemically produced hydroxyl radical of $1 \times 10^{-17} \text{ mol}\cdot\text{L}^{-1}$ (Mill et al. 1980; Güesten et al. 1981; quoted, Howard 1990).

Chemical Name: aminoethylethane, diethylamine

CAS Registry No: 109-89-7

Molecular Formula: $C_4H_{11}N$, $CH_3CH_2NHCH_2CH_3$

Molecular Weight: 73.137

Melting Point ($^{\circ}C$):

−49.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

55.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.6993, 0.6926 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach. 1961)

0.7056 (Weast 1982–83)

0.7070, 0.7016 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

103.4 ($20^{\circ}C$, calculated-density)

109.0 (exptl. at normal bp, Lee et al. 1972)

111.9 (calculated-Le Bas method at normal boiling point.)

Dissociation Constant, pK_a :

10.98 (Perrin 1965; quoted, Howard 1990)

10.80 ($35^{\circ}C$, Perrin 1972)

10.80 (protonated cation + 1, Dean 1985)

11.07 (Sangster 1989)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

31.38, 29.50 ($25^{\circ}C$, bp, Dreisbach 1961)

31.32, 29.07 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

815000 ($14^{\circ}C$, quoted, Verschueren 1983)

miscible (Dean 1985; Riddick et al. 1986; Yaws et al. 1990)

miscible (Stephenson 1993b)

Vapor Pressure (Pa at $25^{\circ}C$ and or as indicated reported temperature dependence equations. Additional data at other temperatures designated* are compiled at the end of this section):

26664* ($21^{\circ}C$, summary of literature data, temp range -33.0 to $55.5^{\circ}C$, Stull 1947)

31130 (calculated by formula, Dreisbach 1961)

$\log(P/mmHg) = 7.14099 - 1209.9/(229.0 + t/^{\circ}C)$; temp range -15 to $90^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

39997* ($31.45^{\circ}C$, temp range 31.45 – $60.58^{\circ}C$, Bittrich & Kauer 1962)

31471* ($25.17^{\circ}C$, temp range 19.73 – $40.22^{\circ}C$, Kilian & Bittrich 1965)

$\log(P/mmHg) = [-0.2185 \times 7307.5/(T/K)] + 7.701718$; temp range -33.0 to $210^{\circ}C$ (Antoine eq., Weast 1972–73)

26660, 38660 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1983)

30110, 31310 (extrapolated-Antoine eq., interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 4.97981 - 580.448/(143.68 + t/^{\circ}C)$; temp range 31.45 – $60.58^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 5.84728 - 994.478/(203.53 + t/^{\circ}C)$; temp range 19.758 – $40.22^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

31130 (selected, Riddick et al. 1986)

$\log (P/\text{kPa}) = 4.92649 - 583.297/(144.145 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

31490 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.96802 - 1058.538/(-61.331 + T/\text{K})$; temp range 302–328 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.92678 - 1028.405/(-66.2061 + T/\text{K})$; temp range 325–437 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 5.8016 - 583.3/(144.1 + t/^{\circ}\text{C})$; temp range 31–61 $^{\circ}\text{C}$ (Antoine eq., Dean 1992)

$\log (P/\text{mmHg}) = 32.626 - 2.4918 \times 10^3/(T/\text{K}) - 9.3285 \cdot \log (T/\text{K}) + 3.990 \times 10^{-3} \cdot (T/\text{K}) + 1.1732 \times 10^{-12} \cdot (T/\text{K})^2$; temp range 223–497 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25 $^{\circ}\text{C}$):

2.596 (exptl., Hine & Mookerjee 1975)

2.537, 2.37 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

6.67 (calculated-vapor liquid equilibrium VLE data, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.43 (shake flask, Collander 1951)

0.57 (shake flask-titration, Sandell 1962)

0.60, 0.61; 0.70 (calculated-fragment const.; calculated- π const., Rekker 1977)

0.58 (Hansch & Leo 1985)

0.58 (20 $^{\circ}\text{C}$, shake flask-GC, Takayama et al. 1985)

0.81 (HPLC- k' correlation, Eadsforth 1986)

0.58 (recommended, Sangster 1989)

0.58 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

0.210 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

1.699 (soil, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} \sim 31.6$ h for a model river 1 m deep flowing at 1 m/s with a wind velocity of 3 m/s (estimated, Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: photooxidation $t_{1/2} > 9.9$ d for the gas-phase reaction with hydroxyl radical in air, based on the rate of disappearance of hydrocarbon due to reaction with OH radical (Darnall et al. 1976);

photooxidation $t_{1/2} = 0.21$ d in air, based on an estimated second-order rate constant $k = 77.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with photochemically produced hydroxyl radicals of 5×10^5 radicals/ cm^3 in air (Atkinson 1987; quoted, Howard 1990).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} > 9.9$ d for the gas-phase reaction with hydroxyl radicals in air, based on the rate of disappearance of hydrocarbon due to reaction with hydroxyl radical (Darnall et al. 1976);

$t_{1/2} = 0.21$ d, based on an estimated rate constant $k \sim 77.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor-phase reaction with photochemically produced hydroxyl radicals of 5×10^5 radicals/ cm^3 in air (Atkinson 1987; quoted, Howard 1990).

TABLE 16.1.2.4.1

Reported vapor pressures of diethylamine at various temperatures

16.1.2.5 *n*-Propylamine

Common Name: Propylamine

Synonym: 1-aminopropane, 1-propanamine, *n*-propylamine

Chemical Name: aminopropane, *n*-propylamine

CAS Registry No: 107-10-8

Molecular Formula: C₃H₉N, CH₃CH₂CH₂NH₂

Molecular Weight: 59.110

Melting Point (°C):

−84.75 (Lide 2003)

Boiling Point (°C):

47.22 (Lide 2003)

Density (g/cm³ at 20°C):

0.7173 (Dreisbach 1961; Weast 1982–83; Dean 1985; Riddick et al. 1986)

0.7123 (25°C, Dreisbach 1961)

Molar Volume (cm³/mol):

82.4 (liquid molar volume, Kamlet et al. 1986, 1987)

88.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK:

10.74, 10.789 (20°C, Perrin 1972)

10.71 (pK_a, 20°C, Weast 1982–83)

10.57 (pK_{BH}⁺, Dean 1985; Riddick et al. 1986)

10.68 (pK_a, Sangster 1989)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

31.13, 29.73 (25°C, bp, Dreisbach 1961)

31.26, 29.54 (25°C, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.974 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

miscible (Dean 1985; Stephenson 1993b)

miscible (Riddick et al. 1986; Howard 1990; Yaws et al. 1990)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

41800* (interpolated-regression of tabulated data, temp range −64.4 to 48.5°C, Stull 1947)

41050 (calculated by formula, Dreisbach 1961)

log (P/mmHg) = 7.2672 − 1218.1/(229.9 + t/°C); temp range −20 to 81°C (Antoine eq. for liquid state, Dreisbach 1961)

42100* (ebulliometry, calculated-Antoine eq., Osborn & Douslin 1968)

log (P/mmHg) = 6.92646 − 1044.028/(t/°C + 210.833); temp range 23–77.6°C (ebulliometric method, Antoine eq., Osborn & Douslin 1968)

log [(P/atm) = [1 − 320.379 ± (T/K)] × 10⁴{0.922208 − 10.51259 × 10^{−4}·(T/K) + 11.25530 × 10^{−7}·(T/K)²}, temp range: 34–77.6°C (ebulliometric method, Cox eq., Osborn & Douslin 1968)

log (P/mmHg) = [−0.2185 × 7408.0/(T/K)] + 7.867998; temp range −64.4 to 214.5°C (Antoine eq., Weast 1972–73)

32660 (20°C, 31°C, Verschueren 1983)

38550; 42110 (22.97°C, quoted exptl., calculated-Antoine eq., Boublik et al. 1984)

log (P/kPa) = 6.05146 − 1044.082/(210.84 + t/°C); temp range 22.97–77.6°C (Antoine eq. from reported exptl. data of Osborn & Douslin 1968, Boublik et al. 1984)

42120 (calculated-Antoine eq., Dean 1985, 1992)

$\log (P/\text{mmHg}) = 6.92651 - 1044.05/(210.84 + t/^{\circ}\text{C})$; temp range: 23–77°C (Antoine eq., Dean 1985, 1992)
 41050 (Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.05136 - 1044.028/(210.833 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 42120 (interpolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.04693 - 1041.725/(-62.596 + T/\text{K})$; temp range 295–351 K (Antoine eq., Stephenson & Malanowski 1987)
 42125 (calculated-Cox eq., Chao et al. 1990)
 $\log (P/\text{mmHg}) = 24.6420 - 2.3152 \times 10^3/(T/\text{K}) - 5.8711 \cdot \log (T/\text{K}) - 4.6258 \times 10^{-11} \cdot (T/\text{K}) + 1.582 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 190–497 (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

1.274 (partial pressure, Butler & Ramchandani 1935)
 0.784; 0.732 (exptl.; calculated-group contribution, Hine & Mookerjee 1975)
 1.330 (calculated-bond contribution, Hine & Mookerjee 1975)
 0.637 (calculated-molecular structure, Russell et al. 1992)
 2.01 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.28 (shake flask-GC, Korenman et al. 1973)
 0.37, 0.39; 0.31 (calculated-f const.; calculated- π const., Rekker 1977)
 0.48 (shake flask-GC, pH 13, Yakayama et al. 1985)
 0.48 (recommended, Sangster 1989)
 0.48 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

–0.886 (estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

< 1.699 (soil, estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} \sim 2.44$ d was estimated for a model river 1 m deep flowing at 1 m/s with a wind speed of 3 m/s (estimated, Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: photooxidation $t_{1/2} = 12$ h in air, based on estimated rate constant $k = 3.21 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \cdot \text{s}^{-1}$ for the vapor-phase reaction with hydroxyl radical of $5 \times 10^5/\text{cm}^3$ at 25°C in the atmosphere (Atkinson 1987; quoted, Howard 1990).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 12$ h, based on estimated second-order rate constant of $3.21 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \cdot \text{s}^{-1}$ for the vapor-phase reaction with hydroxyl radical of $5 \times 10^5/\text{cm}^3$ at 25°C in the atmosphere (Atkinson 1987; quoted, Howard 1990).

16.1.2.6 *n*-Butylamine

Common Name: Butylamine

Synonym: 1-aminobutane, *n*-butylamine, 1-butanamine

Chemical Name: 1-aminobutane, *n*-butylamine

CAS Registry No: 109-73-9

Molecular Formula: C₄H₁₁N, CH₃CH₂CH₂CH₂NH₂

Molecular Weight: 73.137

Melting Point (°C):

−49.1 (Dreisbach 1961; Riddick et al. 1986; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point (°C):

77.0 (Lide 2003)

Density (g/cm³ at 20°C):

0.7414 (Dreisbach 1961; Weast 1982–83)

0.7392 (Riddick et al. 1986)

Molar Volume (cm³/mol):

98.8 (20°C, calculated-density)

110.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK:

10.77 (Perrin 1965; pK_a, 20°C, Weast 1982–83; Howard 1990)

10.65 (Perrin 1972)

10.64 (pK_a, protonated + 1, Dean 1985; Sangster 1989)

10.77 (pK_{BH+}, Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

35.54, 32.11 (25°C, bp, Dreisbach 1961)

35.74, 31.80 (25°C, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

miscible (Dean 1985; Howard 1990; Yaws et al. 1990)

miscible (Riddick et al. 1986)

miscible (Stephenson 1993b)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

13850 (Hoy 1970; Abraham 1984)

12230 (calculated by formula, Dreisbach 1961)

log (P/mmHg) = 7.213 − 1308.4/(224.2 + t/°C); temp range 4–114°C (Antoine eq. for liquid state, Dreisbach 1955)

9600 (20°C, Verschueren 1983)

12230 (quoted lit., Riddick et al. 1986; quoted, Howard 1990)

log (P/kPa) = 6.07009 − 1157.810/(207.80 + t/°C); temp range not specified (Antoine eq., Riddick et al. 1986)

12520 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

log (P_L/kPa) = 6.2635 − 1258.745/(−54.49 + T/K); temp range 313–350 K (Antoine eq., Stephenson & Malanowski 1987)

log (P/mmHg) = 25.0711 − 2.5701 × 10³/(T/K) − 5.8985 · log (T/K) + 7.9399 × 10^{−10} · (T/K) + 1.192 × 10^{−6} · (T/K)²; temp range 124–532 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C):

1.526 (partial pressure, Butler & Ramchandani 1935)

1.528 (exptl., Hine & Mookerjee 1975)

- 1.676, 1.68 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 0.880 (calculated-molecular structure, Russell et al. 1992)
 1.785 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, log K_{OW} :

- 0.68 (shake flask, Collander 1951)
 0.88 (shake flask-titration, Sandell 1962)
 0.81 (shake flask, unpublished result, Leo et al. 1971; Hansch & Leo 1987)
 0.74 (shake flask-titration, Korenman et al. 1973)
 0.90, 0.92; 0.81 (calculated- f const.; calculated- π const., Rekker 1977)
 0.80 (inter-lab. shake flask average, Eadsforth & Moser 1983)
 0.97 (shake flask-GC, Takayama et al. 1985)
 0.86 (recommended, Sangster 1989)
 0.97 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} :

- 3.61 (calculated- S_{oct} and vapor pressure P , Abraham et al. 2001)

Bioconcentration Factor, log BCF:

- 0.505 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, log K_{OC} :

- 1.903 (soil, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)
 1.176, 2.021, 2.029 (Podzol soil, Alfisol soil, sediment, von Oepen et al. 1991)
 1.880 (soil, quoted exptl., Meylan et al. 1992)
 1.780 (soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} = 1.95$ d was predicted for evaporation from a model river 1 m deep, flowing at 1 m/s with a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: estimated vapor phase photooxidation $t_{1/2} = 0.479$ d in air, based on a result of reaction with photochemically produced hydroxyl radical at a concentration of 5×10^5 radicals/cm³ (USEPA 1986; quoted, Howard 1990).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: estimated vapor phase $t_{1/2} = 0.479$ d, based on a result of reaction with photochemically produced hydroxyl radical at a concentration of 5×10^5 radicals/cm³ (USEPA 1986; quoted, Howard 1990).

16.1.2.7 Ethanolamine

Common Name: Ethanolamine

Synonym: β -aminoethyl alcohol, ethylolamine, 2-hydroxyethylamine, β -hydroxyethylamine, monoethanolamine, MEA

Chemical Name: ethanolamine, 2-aminoethanol

CAS Registry No: 141-43-5

Molecular Formula: $\text{C}_2\text{H}_7\text{NO}$, $\text{HOCH}_2\text{CH}_2\text{NH}_2$

Molecular Weight: 61.098

Melting Point ($^{\circ}\text{C}$):

10.5 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

171 (Lide 2003)

Density (g/cm^3 at 20°C):

1.0180 (Weast 1982–83)

1.0147 (Riddick et al. 1986)

Molar Volume (cm^3/mol):

60.4 (Stephenson & Malanowski 1987)

73.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK :

9.48, 9.4994 (Perrin 1972; quoted, Howard 1990)

9.50 (pK_{BH^+} , Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_{v} (kJ/mol):

92.09, 49.831 (25°C , bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

20.50 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} $\text{J}/\text{mol K}$:

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F : 1.0

Water Solubility (g/m^3 or mg/L at 25°C):

miscible (Dean 1985)

miscible (Riddick et al. 1986; quoted, Howard 1990)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

893* (65.4°C , Ramsay-Young method, measured range 65.4 – 170.9°C , Matthews et al. 1950)

$\log (P/\text{mmHg}) = 44.008 - 4089/(T/\text{K}) - 11.446 \pm \log (T/\text{K})$; temp range 65.4 – 170.9°C (Kirchhoff eq., ebulliometry, Matthews et al. 1950)

8707* (106.1°C , ebulliometry, measured range 106.1 – 170.37°C , McDonald et al. 1959)

$\log (P/\text{mmHg}) = 7.7380 - 1772.11/(186.25 + t/^{\circ}\text{C})$; temp range 106 – 170°C , or pressure range 65.31 – 760 mmHg (ebulliometry, McDonald et al. 1959)

53.32 (20°C , Verschueren 1983)

41.64, 46.67 (extrapolated values-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.54175 - 1554.149/(171.175 + t/^{\circ}\text{C})$; temp range 65.5 – 170.9°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.86239 - 1725.168/(185.556 + t/^{\circ}\text{C})$; temp range 106.1 – 170.37°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

42.51 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log (P/\text{mmHg}) = 7.4568 - 1577.67/(172.37 + t/^{\circ}\text{C})$; temp range 65 – 171°C (Antoine eq., Dean 1985, 1992)

48.0 (Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.86290 - 1732.11/(186.215 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

47.34 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_{\text{L}}/\text{kPa}) = 6.8629 - 1732.11/(-86.6 + T/\text{K})$; temp range 310 – 444 K (liquid, Antoine eq., Stephenson & Malanowski 1987)

34.66 (from Dow Chemical's Handbook, Howard 1990)

$\log(P/\text{mmHg}) = 72.9125 - 5.8595 \times 10^3/(T/K) - 21.914 \cdot \log(T/K) - 7.1511 \times 10^{-10} \cdot (T/K) + 5.9841 \times 10^{-6} \cdot (T/K)^2$;
temp range 284–638 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

0.0041 (calculated-bond method, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

−1.31 (shake flask, Collander 1951)

−1.29; −1.35 (calculated- f const., calculated- π const., Rekker 1977)

−1.31 (recommended, Sangster 1993)

−1.31 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

< 0.0 (estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

0.699 (soil, estimated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: photooxidation $t_{1/2} = 11$ h in air, based on an estimated rate constant $k \sim 3.5 \times 10^{-11} \text{ cm}^3 \pm \text{molecule}^{-1} \text{ s}^{-1}$ for the vapor phase reaction with photochemically produced hydroxyl radical of $5 \times 10^5 \text{ radicals/cm}^3$ in air (Atkinson 1987; quoted, Howard 1990).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: half-life of 11 h, based on an estimated rate constant of $3.5 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor phase reaction with photochemically produced hydroxyl radical of $5 \times 10^5 \text{ radicals/cm}^3$ in air (Atkinson 1987; quoted, Howard 1990).

TABLE 16.1.2.7.1

Reported vapor pressures of ethanolamine at various temperatures and the coefficients for the vapor pressure equations

$$\begin{array}{llll} \log P = A - B/(T/K) & (1) & \ln P = A - B/(T/K) & (1a) \\ \log P = A - B/(C + t/^{\circ}\text{C}) & (2) & \ln P = A - B/(C + t/^{\circ}\text{C}) & (2a) \\ \log P = A - B/(C + T/K) & (3) & & \\ \log P = A - B/(T/K) - C \cdot \log (T/K) & (4) & & \end{array}$$

FIGURE 16.1.2.7.1 Logarithm of vapor pressure versus reciprocal temperature for ethanolamine.

16.1.2.8 Diethanolamine

Common Name: Diethanolamine

Synonym: 2,2'-amino-diethanol, 3-aza-1,5-pentanediol, diethylolamine, bis(hydroxyethyl)amine, 2,2'-dihydroxydiethylamine, β,β' -dihydroxydiethylamine, 2,2'-iminobisethanol, 2,2'-iminodiethanol

Chemical Name: diethanolamine

CAS Registry No: 111-42-2

Molecular Formula: $C_4H_{11}NO_2$, $HOCH_2CH_2NHCH_2CH_2OH$

Molecular Weight: 105.136

Melting Point ($^{\circ}C$):

28.0 (Weast 1982–83; Dean 1985; Riddick et al. 1986; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

268.8 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0966 (Weast 1982–83)

1.0936 ($25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

96.5 ($30^{\circ}C$, Stephenson & Malanowski 1987)

126.7 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK :

8.88, 8.97 (Perrin 1972)

8.88 (pK_{BH^+} , Dean 1985; Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

70.3, 65.229 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

25.104 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.934 (mp at $28^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

954000 (Verschuere 1983)

964000 (Dean 1985)

954000 ($20^{\circ}C$, Riddick et al. 1986)

miscible (from Dow Chemical's Handbook, Howard 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

< 1.333 ($20^{\circ}C$, Verschuere 1983)

0.040 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 8.1388 - 2327.9/(174.4 + t/^{\circ}C)$; temp range 194 – $241^{\circ}C$ (Antoine eq., Dean 1985, 1992)

0.030 (quoted lit., Riddick et al. 1986)

$\log(P/kPa) = 7.26458 - 2328.56/(174.399 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

$\log(P_L/kPa) = 7.26044 - 2326.23/(-98.907 + T/K)$; temp range: 423 – $542 K$ (liquid, Antoine eq., Stephenson & Malanowski 1987)

0.0373 (quoted from Dow Chemical's Handbook, Howard 1990)

$\log(P/mmHg) = 122.0877 - 8.8422 \times 10^3/(T/K) - 40.422 \cdot \log(T/K) + 1.4062 \times 10^{-2} \cdot (T/K) + 1.1986 \times 10^{-12} \cdot (T/K)^2$; temp range 301 – $542 K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

5.42×10^{-9} (Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 1.43 (shake flask, Collander 1951)
- 1.51 (calculated-fragment const., Rekker & De Kort 1979)
- 1.43 (recommended, Sangster 1993)
- 1.43 (recommended, Hansch et al 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- < 0.0 (estimated- K_{OW} , Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

- 0.602 (soil, estimated- K_{OW} , Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: photooxidation $t_{1/2} = 0.72\text{--}7.2$ h in air, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard 1990; Howard et al. 1991).

Biodegradation: aqueous aerobic $t_{1/2} = 14.4\text{--}168$ h, based on measured half-life in surface water grab sample experiment (Boethling & Alexander 1979; quoted, Howard et al. 1991) and aqueous aerobic screening test data (Gerike & Fischer 1979; Bridie et al. 1979; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 57.6\text{--}672$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 0.72\text{--}7.2$ h, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard 1990; Howard et al. 1991);

atmospheric transformation lifetime by reaction with water was estimated to be < 1 d (Kelly et al. 1994).

Surface water: $t_{1/2} = 14.4\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 28.8\text{--}336$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 14.4\text{--}168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

16.1.2.9 Triethanolamine

Common Name: Triethanolamine

Synonym: 2,2',2''-nitrilotriethanol, 2,2',2''-nitrilotrisethanol, triethylolamine, trihydroxytriethylamine, trolamine, tris(hydroxyethyl)-amine, TEA

Chemical Name: triethanolamine

CAS Registry No: 102-71-6

Molecular Formula: $C_6H_{15}NO_3$, $(HOCH_2CH_2)_3N$

Molecular Weight: 149.188

Melting Point ($^{\circ}C$):

20.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

335.4 (Dean 1985; Riddick et al. 1986; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1242 (Weast 1982–83; Dean 1985)

1.1196 ($25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

133.3 (Stephenson & Malanowski 1987)

182.1 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK :

7.92 (Perrin 1972; quoted, Howard 1990)

7.76 (pK_{BH^+} , Dean 1985; Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

67.475 (bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

27.20 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Dean 1985; Howard 1990)

miscible (Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

< 1.33 ($20^{\circ}C$, Verschueren 1983)

0.0131 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 9.19319 - 4543.817/(297.839 + t/^{\circ}C)$, temp range: 252.7 – $305.6^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

0.0100 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 10.0675 - 4542.78/(297.76 + t/^{\circ}C)$, temp range: 252 – $305^{\circ}C$ (Antoine eq., Dean 1985, 1992)

< 1.30 ($20^{\circ}C$, Riddick et al. 1986)

$\log(P/kPa) = 7.67989 - 2962.73/(186.75 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

$\log(P_L/kPa) = 9.53861 - 4951.87/(49.99 + T/K)$, temp range: 523 – $579\ K$, (Antoine eq., Stephenson & Malanowski 1987)

4.79×10^{-4} (quoted from Dow Chemical's Handbook, Howard 1990)

$\log(P/mmHg) = 135.3206 - 1.0312 \times 10^4/(T/K) - 44.637 \cdot \log(T/K) + 1.4368 \times 10^{-2} \cdot (T/K) - 1.7552 \times 10^{-13} \cdot (T/K)^2$; temp range 294 – $787\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

3.42×10^{-14} (Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 1.32, -1.75 (calculated, Verschueren 1983)
- 1.59 (Howard 1990)
- 1.00 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- < 0.0 (estimated- K_{OW} , Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

- 0.477 (soil, estimated- K_{OW} , Howard 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: photooxidation $t_{1/2} = 4.0$ h in air, based on an estimated rate constant $k \sim 10.4 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ for the vapor phase reaction with photochemically produced hydroxyl radical of $5 \times 10^5 \text{ radicals/cm}^3$ in air at 25°C (Atkinson 1987; quoted, Howard 1990).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 4.0$ h, based on an estimated rate constant $k \sim 10.4 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor phase reaction with photochemically produced hydroxyl radical of $5 \times 10^5 \text{ radicals/cm}^3$ in air at 25°C (Atkinson 1987; quoted, Howard 1990).

16.1.3 AROMATIC AMINES**16.1.3.1 Aniline**

Common Name: Aniline

Synonym: phenylamine, aminobenzene, benzeneamine, benzenamine

Chemical Name: aniline

CAS Registry No: 62-53-3

Molecular Formula: $C_6H_5NH_2$

Molecular Weight: 93.127

Melting Point ($^{\circ}C$):

-6.02 (Lide 2003)

Boiling Point ($^{\circ}C$):

184.1 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.02173, 1.01750 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955)

1.02173 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

91.2 ($20^{\circ}C$, calculated-density)

110.2 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.596 (Perrin 1972; Howard 1989)

4.600 (McLeese et al. 1979; Riddick et al. 1986; Sangster 1989)

4.630 (Weast 1982–83)

4.58, 3.96 (quoted, HPLC, Miyake et al. 1987)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

54.28, 43.17 ($25^{\circ}C$, bp, Dreisbach 1955)

55.843, 44.53 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

36650 (Hill & Macy 1924)

36070 (Seidell 1941)

38670 (shake flask-residue volume method, Booth & Everson 1948)

36220 (shake flask-interferometry, Donahue & Bartell 1952)

34100 (Stephen & Stephen 1963)

36600 (Kenaga 1980)

34000 (Verschueren 1983)

56900 (calculated-activity coeff. γ by UNIFAC, Fu & Luthy 1985, 1986)

33800 (selected, Riddick et al. 1986)

34200 (selected, Yaws et al. 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3 ($43.7^{\circ}C$, static method, measured range 43.7 – $183.9^{\circ}C$, Kahlbaum 1898)

85.71* (extrapolated-regression of tabulated data, temp range 34.8 – $184.4^{\circ}C$ Stull 1947)

$\log(P/mmHg) = 7.57170 - 1941.7/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

10351* ($112.92^{\circ}C$, ebulliometry, measured range 112.92 – $183.93^{\circ}C$, Dreisbach & Shrader 1949)

89.52 (calculated by formula, Dreisbach 1955; quoted, Riddick et al. 1986)

$\log (P/\text{mmHg}) = 7.24179 - 1674.3/(200.0 + t/^{\circ}\text{C})$; temp range 90–250°C (Antoine eq. for liquid state, Dreisbach 1955)

6806* (102.59°C, ebulliometry, measured range 102.59–185.15°C, McDonald et al. 1959)

$\log (P/\text{mmHg}) = 7.25375 - 1684.35/(201.175 + t/^{\circ}\text{C})$, temp range 103–185°C (Antoine eq., ebulliometry, McDonald et al. 1959)

133.3* (31.55°C, calculated-thermodynamic properties, temp range 31.55–184.40°C, Hatton et al. 1962)

$\log (P/\text{mmHg}) = [-0.2185 \times 11307.6/(T/\text{K})] + 8.221995$; temp range 34.8–422.4°C (Antoine eq., Weast 1972–73)

88.30 (extrapolated-Antoine eq., Boublik et al. 1973)

$\log (P/\text{mmHg}) = 7.3201 - 1731.515/(205.049 + t/^{\circ}\text{C})$; temp range 102.6–185.2°C (Antoine eq. from reported exptl. data of McDonald et al. 1959, Boublik et al. 1973)

$\log (P/\text{mmHg}) = [-0.2185 \times 11307.6/(T/\text{K})] + 8.221995$; temp range 34.8–422.4°C (Antoine eq., Weast 1972–73)

82.71 (calculated-Cox eq., Chao et al. 1983)

$\log (P/\text{atm}) = [1 - 457.025/(T/\text{K})] \times 10^4 \{0.911551 - 6.64936 \times 10^{-4} \cdot (T/\text{K}) + 5.25455 \times 10^{-7} \cdot (T/\text{K})^2\}$; temp range: 267.3–695.0 K (Cox eq., Chao et al. 1983)

80 ± 6 (gas saturation-HPLC/UV, Sonnefeld et al. 1983)

40.0 (20°C, Verschueren 1983)

88.0, 48.24 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.43196 - 1722.154/(205.002 + t/^{\circ}\text{C})$; temp range 102.6–185.2°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 5.68977 - 1234.569/(151.207 + t/^{\circ}\text{C})$; temp range 112.9–183.9°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

65.18 (Daubert & Danner 1985)

89.30 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log (P/\text{mmHg}) = 7.32010 - 1731.515/(206.049 + t/^{\circ}\text{C})$; temp range 102–185°C (Antoine eq., Dean 1985, 1992)

$\log (P/\text{kPa}) = 5.69066 - 1941.7/(230.0 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)

89.60 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.40627 - 1702.817/(-70.155 + T/\text{K})$; temp range 304–458 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 8.1019 - 2728/(T/\text{K})$; temp range 273–338 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.41147 - 1708.239/(-69.454 + T/\text{K})$; temp range 373–458 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.44338 - 1682.348/(-78.065 + T/\text{K})$; temp range: 455–523 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

86.70 (calculated-Cox eq., Chao et al. 1990)

$\log (P/\text{mmHg}) = 124.3764 - 7.1676 \times 10^3/(T/\text{K}) - 42.763 \cdot \log (T/\text{K}) + 1.7336 \times 10^{-2} \cdot (T/\text{K}) + 5.7138 \times 10^{-15} \cdot (T/\text{K})^2$; temp range 267–699 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

13778 (Hakuta et al. 1977)

12.16 (measured, Yoshida et al. 1983)

0.193 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

0.90 (shake flask-UV, Fujita et al. 1964)

0.90 (shake flask, Iwasa et al. 1965)

0.90 (shake flask-UV, Hansch et al. 1968)

 0.89 (shake flask-UV at pH 7.4, El Tayar et al. 1984)
 0.99 (calculated-activity coeff. γ from UNIFAC, Campbell & Luthy 1985)
 0.81, 1.08 (HPLC- k' correlation, Eadsforth 1986)
 0.91 (RP-HPLC-RT correlation, Eadsforth 1986)
 0.98 (shake flask-UV at pH 7.5, Martin-Villodre et al. 1986)
 0.93 (HPLC method average, Ge et al. 1987)
 0.78 (HPLC- k' correlation, Miyake et al. 1987)
 1.18 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
 0.940 ± 0.006 (shake flask/slow-stirring-GC, De Bruijn et al. 1989)
 0.90 (recommended, Sangster 1989, 1993)
 0.942 ± 0.010 ; 0.940 ± 0.006 (shake flask/stir-flask method by BRE; RITOX, inter-laboratory studies, Brooke et al. 1990)
 0.90 (shake flask-GC, Alcorn et al. 1993)
 1.21, 0.89, 0.87, 1.09 (HPLC- k' correlation, different combinations of stationary and mobile phases under isocratic conditions, Makovskaya et al. 1995)
 0.92 (shake flask-dialysis tubing-HPLC/UV, both phases, Andersson & Schröder 1999)
 0.88 (microemulsion electrokinetic chromatography-retention factor correlation, Jia et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 0.78 (fish, Lu & Metcalf 1975)
 0.30 (calculated-S, Kenaga 1980)
 < 1.0 (fish, Freitag et al. 1982)
 < 1.0, 0.602, 3.01 (golden orfe, algae, activated sludge, Freitag et al. 1982)
 0.602 (alga *Chlorella fusca*, wet wt. basis, Geyer et al. 1984)
 0.845 (alga *Chlorella fusca*, calculated- K_{OW} , Geyer et al. 1984)
 < 1.0, < 1.0, 2.70 (golden ide, algae, activated sludge, Freitag et al. 1985)
 2.77 (*Daphnia magna*, based on elimination phase, Dauble et al. 1986)
 1.87 (*Daphnia magna*, based on ^{14}C and exposure water, Dauble et al. 1986)
 0.70 (fish, correlated- K_{OW} , Isnard & Lambert 1988)
 0.78 (quoted, Isnard & Lambert 1988, 1989)
 0.41 (zebrafish, Kalsch et al. 1991)
 0.41 (zebrafish, Zok et al. 1991)
 0.41; 1.04, -0.87, 0.03 (quoted exptl.; calculated values- K_{OW} , Bintein et al. 1993)

Sorption Partition Coefficient, $\log K_{OC}$:

- 3.11; 2.11 (H-montmorillonite at pH 8.35; pH 6.80, Bailey et al. 1968)
 1.86 (soil average, Moreale & Van Bladel 1976)
 1.41 (average of seven agricultural soils, Briggs 1981)
 3.59 (colloidal organic carbon/ground water, Means et al. 1982)
 2.11; 2.61 (soil; more acidic soil, Pillai et al. 1982)
 2.49; 2.11 (nonsterile Hagerstown soil; sterile Hagerstown soil, Pillai et al. 1982)
 2.96; 2.61 (nonsterile Palouse soil; sterile Palouse soil, Pillai et al. 1982)
 1.17 (soil, quoted as $\log K_{OM}$, Sabljic 1987)
 2.12, 2.05, 2.06 (calculated values: Podzol soil, Alfisol soil, sediment, von Oepen et al. 1991)
 0.596 (calculated- K_{OW} , Kollig 1993)

- 1.08, 1.25, 0.98 (RP-HPLC- k' correlation on 3 different stationary phases, Szabo et al. 1995)
 1.41 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 2.07; 1.65 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1996)
 2.70, 1.64, 2.08, 2.04, 2.29 (first generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask-batch equilibrium-HPLC/UV, Gawlik et al. 1998)
 2.384, 1.503, 1.279, 1.437, 2.136 (second generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask-batch equilibrium-HPLC/UV and HPLC- k' correlation, Gawlik et al. 2000)
 1.0–1.54 (5 soils, pH 2.8–7.2, batch equilibrium-sorption isotherm, Li et al. 2000)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} = 12$ d from a measured Henry's law constant of 1.2×10^{-4} atm m³ mol⁻¹ (Yoshida et al. 1983; quoted, Howard 1989) for a model river of 1-m deep with a 1 m/s current and a 3 m/s wind (Lyman et al. 1982; quoted, Howard 1989);
 volatilization $t_{1/2}(\text{calc}) = 55$ d (Toräng et al. 2002).

Photolysis: first-order rate constants for photosensitized reactions in water with various humic substances as sensitizers: $k = 0.17$ h⁻¹ with aquatic humus from Aucilla River, $k = 0.12$ h⁻¹ with Aldrich humic acid, $k = 0.091$ h⁻¹ with Fluka humic acid and $k = 0.11$ h⁻¹ with Contech fulvic acid in sunlight, corresponding to half-lives of 4 to 8 h (Zepp et al. 1981); photolysis $t_{1/2} = > 50$ yr at 15°C and a pH 5–9 (Toräng et al. 2002).

Oxidation: rate constant k ; for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO₃ radical and k_{O_3} with O₃ or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k = 1 \times 10^4$ M⁻¹ s⁻¹ for oxidation by RO₂ radical at 30°C in aquatic systems with $t_{1/2} = 0.8$ d (Howard 1972; Hendry et al. 1974; quoted, Mill 1982)

$k < 2 \times 10^2$ M⁻¹ s⁻¹ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100$ yr (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{\text{OH}} = 1.20 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹, $k_{\text{OH}}(\text{av.}) = 1.17 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹ at 296 K (flash photolysis-RF, Rinke & Zetzsch 1984; Witte et al. 1986)

$k_{\text{OH}}^* = 1.10 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹ at 298 K, measured range: 239–362 K (flash photolysis-resonance fluorescence, Witte et al. 1986)

$k_{\text{OH}}(\text{calc}) = 1.54 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹ at room temp. (Atkinson et al. 1985)

$k_{\text{OH}}(\text{obs}) \approx 6.0 \times 10^{-11}$ cm³ molecule⁻¹ s⁻¹; $k_{\text{OH}}(\text{calc.}) = 1.16 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹ at room temp. (Atkinson 1985)

$k_{\text{OH}}(\text{calc}) = 1.36 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹, $k_{\text{OH}}(\text{obs.}) = 1.17 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹. (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}}^*(\text{exptl}) = 1.18 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹ at 296 ± 2 K, measured range: 265–455 K; and $k_{\text{O}_3} = 1.12 \times 10^{-18}$ cm³ molecule⁻¹ s⁻¹ at 296 ± 2 K (relative rate method, Atkinson et al. 1987)

$k_{\text{OH}}^* = 1.11 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 1.385 \times 10^{-10}$ cm³ molecule⁻¹ s⁻¹ (molecular orbital calculations, Klamt 1993)

Hydrolysis:

Biodegradation: completely degraded by a soil inoculum in 4 d (Alexander & Lustigman 1966; quoted, Verschuere 1983; Howard 1989);

completely degraded in 20 d by bacteria in river mud (Calamari et al. 1980; quoted, Howard 1989);

$k = 0.23$ d⁻¹ and corresponding to a $t_{1/2} = 3$ d in samples of White Lake water at 29°C (Subba-Rao et al. 1982);

average rate of biodegradation $k = 19.0$ mg COD g⁻¹ h⁻¹ for 94.5% removal (Scow 1982);

biodegradation $t_{1/2} = 4.5$ d in unpolluted and $t_{1/2} < 0.5$ d in polluted pond water as model environments (Lyons et al. 1984);

0.46 mM aniline solution degraded by strain Ani1 within 14 d in water (Schnell et al. 1989);

average exptl. $k = 0.044$ h⁻¹ compared to the group-contribution method predicted rate constants of 0.050 h⁻¹ (nonlinear) and 0.018 h⁻¹ (Tabak & Govind 1993);

first-order $k = 1.0$ d⁻¹ for batch expt. with Elbe water at 20°C (Börnack et al. 2001);

field first-order degradation $k \sim 1.8$ d⁻¹ for 2 different dates with water temperatures of 21.9 and 14.7°C, respectively, in Rhine river and rate constant obtained in laboratory shake flask batch tests with Rhine water averaged 1.5 d⁻¹ at 15°C and 2.0 d⁻¹ at 20°C (Toräng et al. 2002).

Biotransformation: mean bacteria transformation rate constant for all three sites of $(1.1 \pm 0.8) \times 10^{-11}$ L·organism⁻¹·h⁻¹ (Paris & Wolfe 1987; quoted, Steen 1991).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 0.052 \pm 0.0067$ h⁻¹; $k_2 = 7.200 \pm 1.3000$ h⁻¹ (Kalsch et al. 1991)

$k_1 = 11.10 \pm 3.2000$ h⁻¹ (zebrafish, Zok et al. 1991)

Half-Lives in the Environment:

Air: atmospheric lifetimes of 2.3 h in clean troposphere and 1.2 h in moderately polluted atmosphere, based on gas-phase reaction with hydroxyl radical at room temp.; atmospheric lifetimes of 15.0 d in clean troposphere and 5.0 d in moderately polluted atmosphere, based on gas-phase reaction with O₃ at room temp. (Atkinson et al. 1987)

$t_{1/2} \sim 3.3$ h, based on reaction with photochemically produced hydroxyl radical (Howard 1989);

atmospheric transformation lifetime was estimated to be < 1 d (Kelly et al. 1994).

Surface water: estimated $t_{1/2} = 2.3$ d in Rhine river in case of a first order reduction process (Zoeteman et al. 1980; quoted, Howard 1989);

estimated $t_{1/2} = 0.3$ –3.0 d in river waters (Zoeteman et al. 1980);

$t_{1/2} = 4$ to 8 h in May sunlight with both commercial humic acids and aquatic humus as photosensitizers near-surface water and $t_{1/2} \sim 1$ wk in distilled water (Zepp et al. 1981);

$t_{1/2} = 6$ d in eutropic pond and $t_{1/2} = 21$ d in an oligotrophic lake (Subba-Rao et al. 1982; quoted, Howard 1989);

biodegradation $t_{1/2} = 4.5$ d in unpolluted and $t_{1/2} < 0.5$ d in polluted pond water as model environments (Lyons et al. 1984);

$t_{1/2} = 4$ –33 d at 15°C (Ingerslev & Nyholm 2000);

$t_{1/2} \sim 9$ h in the Rhine river at 15 and 22°C (Toräng et al. 2002).

Ground water: estimated $t_{1/2} \sim 30$ –300 d (Zoeteman et al. 1980).

FIGURE 16.1.3.1.1 Logarithm of vapor pressure versus reciprocal temperature for aniline.

16.1.3.2 2-Chloroaniline

Common Name: 2-Chloroaniline

Synonym: 1-amino-2-chlorobenzene, *o*-aminochlorobenzene, *o*-chloroaniline, 2-chlorophenylamine

Chemical Name: 1-amino-2-chlorobenzene, *o*-chloroaniline, 2-chloroaniline

CAS Registry No: 95-51-2

Molecular Formula: $C_6H_4NH_2Cl$

Molecular Weight: 127.572

Melting Point ($^{\circ}C$):

- −1.94 (β -2-chloroaniline, Dreisbach 1955; Weast 1872–83, Riddick et al. 1986)
- −14.0 (α -2-chloroaniline, Weast 1982–83; Verschueren 1983; Howard 1989)
- −1.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

- 208.8 (Kahlbaum 1898; Stull 1947; Dreisbach 1955; Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

- 1.21266, 1.20787 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955)
- 1.21251, 1.20775 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

- 105.2 ($20^{\circ}C$, Stephenson & Malanowski 1987)
- 131.1 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

- 2.661 (Perrin 1972; quoted, Howard 1989)
- 2.650 (Weast 1982–83)
- 2.640 (protonated cation + 1, Dean 1985)
- 2.640 (Riddick et al. 1986)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

- 57.5 ± 5 ($25^{\circ}C$, Piacente et al. 1985)
- 56.756, 44.35 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

- 11.88 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

- 8760 (Dreisbach 1955)
- 3765 ($20^{\circ}C$, shake flask-GC, Chiou 1981; Chiou & Schmedding 1981; Chiou et al. 1982)
- 3763 (calculated- K_{ow} , Müller & Klein 1992)
- 4740 (calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 40.31* (extrapolated-regression of tabulated data, measured range 64.4 – $208.8^{\circ}C$, Kahlbaum 1898)
- 37.77* (extrapolated-regression of tabulated data, temp range 46.3 – $208.8^{\circ}C$, Stull 1947)
- $\log (P/mmHg) = 7.63311 - 2085.5/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)
- 7605* ($124.48^{\circ}C$, ebulliometry, measured range 124.48 – $208.84^{\circ}C$, Dreisbach & Shrader 1949)
- 33.77 (calculated by formula, Dreisbach 1955; selected, Riddick et al. 1986)
- $\log (P/mmHg) = 7.19240 - 1762.74/(200.0 + t/^{\circ}C)$; temp range 110 – $330^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)
- $\log (P/mmHg) = [-0.2185 \times 12441.0/(T/K)] + 8.56946$; temp range 46.3 – $208.8^{\circ}C$ (Antoine eq., Weast 1972–73)
- 33.88 (calculated-Antoine eq., Dean 1985, 1992)

$\log (P/\text{mmHg}) = 7.56265 - 1998.6/(220.0 + t/^{\circ}\text{C})$, temp range 20–108°C (Antoine eq., Dean 1985, 1992)
 $\log (P/\text{mmHg}) = 7.19240 - 1762.74/(200.0 + t/^{\circ}\text{C})$, temp range: 108–300°C (Antoine eq., Dean 1985, 1992)
 35.30* (torsion-weighing effusion, Piacente et al. 1985)
 $\log (P/\text{kPa}) = (8.63 \pm 0.16) - (3006 \pm 56)/(T/\text{K})$; temp range: 287–336 K (Antoine eq., combined torsion-weighing effusion, Piacente et al. 1985)
 $\log (P/\text{kPa}) = 6.75801 - 2085.50/(230.0 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 18.97 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 5.84227 - 1432.2/(-108.81 + T/\text{K})$; temp range 397–482 K (Antoine eq., Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 90.6491 - 6.041 \times 10^3/(T/\text{K}) - 31.118 \cdot \log (T/\text{K}) + 1.1564 \times 10^{-2} \cdot (T/\text{K}) + 4.8388 \times 10^{-13} \cdot (T/\text{K})^2$;
 temp range 271–722 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

0.760 (calculated-P/C, Howard 1989)
 0.425 (calculated-P/C, Meylan & Howard 1991)
 0.143 (estimated-bond contribution, Meylan & Howard 1991)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.81 (shake flask, Fujita et al. 1964)
 1.90 (Leo et al. 1971; Hansch & Leo 1979; Hansch & Leo 1985)
 1.92 (exptl., Leo et al. 1971; McCall 1975; Rekker 1977)
 1.92 (HPLC- k' correlation, Carlson et al. 1975)
 1.63 (calculated- π const., Norrington et al. 1975)
 1.61, 1.73 (calculated- π const., calculated- f const., Rekker 1977)
 1.90, 1.92 (shake flask, Hansch & Leo 1979)
 1.74 (HPLC- k' correlation, Könemann et al. 1979)
 1.74 (calculated- f const., Rekker & De Kort 1979)
 1.91 \pm 0.01 (HPLC- k' , Hammers et al. 1982)
 1.99 (HPLC- k' correlated, Hammers et al. 1982)
 1.926 \pm 0.021 (slow-stirring-GC, De Bruijn et al. 1989)
 1.88 (recommended, Sangster 1993)
 1.93 \pm 0.14, 1.55 \pm 0.51 (solvent generated liquid-liquid chromatography SGLLC-correlation, RP-HPLC- k' correlation, Cichna et al. 1995)
 1.90 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

< 2.0 (Kawasaki 1980)
 1.30 (estimated, Canton et al. 1985)
 1.18 (zebrafish, Zok et al. 1991)
 0.301–0.57 (carp, Tsuda et al. 1993)
 1.18; 1.56, 0.73, 0.94 (quoted; calculated values- K_{OW} , Bintein et al. 1993)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} \sim 5.6$ d was estimated for a model river of 1-m deep (Lyman et al. 1982; quoted, Howard 1989);
 estimated $t_{1/2} = 64$ d from a representative environmental pond (stagnant) (USEPA 1987; quoted, Howard 1989).

Photolysis:

Oxidation: rate constant of $5.1 \times 10^{-12} \text{ cm}^3/\text{molecule} \cdot \text{s}$ for the reaction with hydroxyl radical in a typical ambient atmosphere at 25°C with $t_{1/2} \sim 2$ d (GEMS 1987; quoted, Howard 1989).

Hydrolysis:

Biodegradation: average biodegradation rate of 25 mg COD $\text{g}^{-1} \text{ h}^{-1}$ for 95.6% removal (Scow 1982).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 7.10 \text{ h}^{-1}$ (zebrafish, Zok et al. 1991)

$k_2 = 0.19 \text{ h}^{-1}$ (carp, Tsuda et al. 1993)

Half-Lives in the Environment:

Air: estimated atmospheric $t_{1/2} = 2 \text{ d}$, based on the reaction with sunlight-produced hydroxyl radical (GEMS 1987; quoted, Howard 1989).

Surface water:

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 3.6 \text{ h}$ in carp with excretion rate constant $k = 0.19 \text{ h}^{-1}$ (Tsuda et al. 1993).

TABLE 16.1.3.2.1

Reported vapor pressures of 2-chloroaniline at various temperatures and the coefficients for the vapor pressure equations

16.1.3.3 3-Chloroaniline

Common Name: 3-Chloroaniline

Synonym: 1-amino-3-chlorobenzene, *m*-chloroaniline, 3-chlorophenylamine

Chemical Name: 1-amino-3-chlorobenzene, *m*-chloroaniline, 3-chloroaniline

CAS Registry No: 108-42-9

Molecular Formula: $C_6H_4NH_2Cl$

Molecular Weight: 127.572

Melting Point ($^{\circ}C$):

−10.28 (Lide 2003)

Boiling Point ($^{\circ}C$):

230.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.21606 ($20^{\circ}C$, Weast 1982–83)

1.2150 ($22^{\circ}C$, Dean 1985; Budavari 1989)

Molar Volume (cm^3/mol):

105.0 ($22^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

131.1 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

3.52 (Perrin 1972)

3.50 (McLeese et al. 1979)

3.46 (Weast 1982–83)

3.52 (protonated cation + 1, Dean 1985)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

61.04, 46.016 ($25^{\circ}C$, bp, Dreisbach 1955)

60.9 ± 5 ($25^{\circ}C$, Piacente et al. 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.25 (Dreisbach 1955)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

5442 ($20^{\circ}C$, shake flask-GC, Chiou 1981; Chiou & Schmedding 1981; Chiou et al. 1982)

5447 (calculated- K_{ow} , Müller & Klein 1992)

4740 (calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

13.14* (extrapolated-regression of tabulated data, measured range 81.7 – $228.5^{\circ}C$, Kahlbaum 1898)

11.94* (extrapolated-regression of tabulated data, temp range 63.5 – $228.5^{\circ}C$, Stull 1947)

11.17 (calculated by formula, Dreisbach 1955)

$\log (P/mmHg) = 7.23603 - 1857.75/(196.64 + t/^{\circ}C)$; temp range 125 – $350^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

$\log (P/mmHg) = [-0.2185 \times 133854.6/(T/K)] + 8.761546$; temp range 63.5 – $228.5^{\circ}C$ (Antoine eq., Weast 1972–73)

11.06 (calculated-Antoine eq., Dean 1985, 1992)

$\log (P/mmHg) = 7.59939 - 2073.75/(215.0 + t/^{\circ}C)$, temp range 15 – $125^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log (P/mmHg) = 7.23603 - 1857.75/(196.64 + t/^{\circ}C)$, temp range 125 – $310^{\circ}C$ (Antoine eq., Dean 1985, 1992)

15.60* (torsion-weighing effusion, Piacente et al. 1985)

$\log (P/\text{kPa}) = (8.86 \pm 0.10) - (3180 \pm 40)/(T/\text{K})$; temp range ~290–345 K (Antoine eq., combined torsion-weighing effusion, Piacente et al. 1985)

9.530 (extrapolated from Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.36093 - 1857.75/(-76.51 + T/\text{K})$; temp range 398–573 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 65.6033 - 5.3779 \times 10^3/(T/\text{K}) - 20.518 \cdot \log (T/\text{K}) + 6.7861 \times 10^{-3} \cdot (T/\text{K}) + 2.1167 \times 10^{-13} \cdot (T/\text{K})^2$; temp range 263–751 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

0.223 (calculated-P/C)

0.102 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.88 (shake flask-UV, Fujita et al. 1964)

1.88 (Ichikawa et al. 1969)

1.88 (Leo et al. 1971; Hansch & Leo 1979)

1.90 (exptl., Leo et al. 1971; Rekker 1977)

1.98 (calculated- π const., Norrington et al. 1975)

1.73, 1.75; 1.61 (calculated-f const., calculated- π const., Rekker 1977)

1.90, 1.88 (shake flask, Hansch & Leo 1979)

1.57 (HPLC- k' correlation, Könemann et al. 1979)

1.89 ± 0.01 (HPLC- k' correlation, Hammers et al. 1982)

2.00 (HPLC- k' correlation, Hammers et al. 1982)

1.910 ± 0.013 (slow-stirring-GC, De Bruijn et al. 1989)

1.88 (recommended, Sangster 1993)

1.91 ± 0.14 , 1.52 ± 0.51 (solvent generated liquid-liquid chromatography SGLLC-correlation, RP-HPLC- k' correlation, Cichna et al. 1995)

1.88 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

1.06 (zebrafish, Zok et al. 1991)

-0.097 to 0.342 (average for carp, Tsuda et al. 1993)

1.06; 1.55, 0.70, 0.92 (quoted; calculated values, Bintein et al. 1993)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: direct aqueous photolysis rate constant $k = 0.393 \pm 0.006 \text{ min}^{-1}$ with a calculated $t_{1/2} = 1.76 \text{ min}$ (Stegeman et al. 1993).

Oxidation:

Hydrolysis: direct photohydrolysis rate constant $k = 0.393 \pm 0.006 \text{ min}^{-1}$ with a calculated $t_{1/2} = 1.76 \text{ min}$ (Stegeman et al. 1993).

Biodegradation: average biodegradation rate of $6.2 \text{ mg COD g}^{-1} \text{ h}^{-1}$ for 97.2% removal (Scow 1982).

Biotransformation: mean bacteria transformation rate constant for all three sites of $(2.2 \pm 1.7) \times 10^{-12} \text{ L} \cdot \text{organism}^{-1} \cdot \text{h}^{-1}$ (Paris & Wolfe 1987; quoted, Steen 1991).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 19.1 \text{ h}^{-1}$ (zebrafish, Zok et al. 1991)

$k_2 = 0.21 \text{ h}^{-1}$ (carp, Tsuda et al. 1993)

Half-Lives in the Environment:

Biota: $t_{1/2} = 3.3 \text{ h}$ in carp with excretion rate $k = 0.21 \text{ h}^{-1}$ (Tsuda et al. 1993).

$\log (P_s/\text{kPa}) = 13.448 - 4736/(T/K)$, temp range 283–303 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 7.3489 - 2729/(T/K)$, temp range 363–505 K (Antoine eq.-II, Stephenson & Malanowski 1987)

3.33, 32.0 (quoted, calculated-solvatochromic parameters, Banerjee et al. 1990)

$\log (P/\text{mmHg}) = -15.3259 - 2.8592 \times 10^3/(T/K) + 11.527 \cdot \log (T/K) - 1.8071 \times 10^{-2} \cdot (T/K) + 7.2359 \times 10^{-6} \cdot (T/K)^2$; temp range 343–754 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

1.0840 (calculated-P/C, Howard 1989)

0.0395 (calculated-P/C, Meylan & Howard 1991)

0.1430 (estimated-bond contribution, Meylan & Howard 1991)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.84 (Ichikawa et al. 1969)

1.83 (quoted exptl., Leo et al. 1969, 1971; Hansch & Leo 1985)

1.83 (HPLC- k' correlation; Carlson et al. 1975)

1.83 (shake flask, Hansch & Leo 1979)

1.57 (HPLC- k' correlation, Könemann et al. 1979)

1.83, 20.2 (HPLC- k' correlation, Hammers et al. 1982)

1.64 (inter-laboratory studies, HPLC-RT correlation average, Eadsforth & Moser 1983)

1.88 ± 0.02 (HPLC-RV correlation-ALPM; Garst & Wilson 1984)

2.78 (shake flask, OECD 1981 Guidelines, Geyer et al. 1984)

1.83 (shake flask, Log P Database, Hansch & Leo 1987)

1.83 (RP-HPLC- k' correlation, Minick et al. 1988)

1.88 ± 0.014 (shake flask/slow-stirring-GC, De Bruijn et al. 1989)

1.83 (shake flask, Leahy et al. 1989)

1.80, 1.82 (shake flask, HPLC-RT correlation, Wang et al. 1989)

2.01 (centrifugal partition chromatography CPC-RV correlation, El Tayar et al. 1991)

1.83 (recommended, Sangster 1993)

1.83 (pH 7.4, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

< 1.30 (golden orfe for 3-d exposure, Körte et al. 1978)

3.08 (green algae for 24-h exposure of dry wt. basis, Körte et al. 1978)

2.42 (green algae for 24-h exposure of wet wt. basis, Körte et al. 1978)

< 1.0, 2.41, 3.11 (golden orfe, algae, activated sludge, Freitag et al. 1982)

2.42 (alga *Chlorella fusca*, wet wt. basis, Geyer et al. 1984)

2.06 (alga *Chlorella fusca*, calculated- K_{ow} , Geyer et al. 1984)

1.11, 2.42, 2.45 (golden ide, algae, activated sludge, Freitag et al. 1985)

0.91 (zebrafish, Zok et al. 1991)

−0.097–0.23 (carp, Tsuda et al. 1993)

0.91; 1.52, 0.63, 0.88 (quoted; calculated values, Bintein et al. 1993)

2.58 (algae *Chlorella fusca*, wet wt basis, Wang et al. 1996)

Sorption Partition Coefficient, $\log K_{oc}$:

2.36–2.67 (five Belgium soils, Van Bladel & Moreale 1977)

1.98–3.18 (five German soils, Rott et al. 1982)

3.74 (colloidal org. matter in ground water, Means 1983)

1.86 (calculated-MCI χ , Sabljic 1987)

2.08 (RP-HPLC- k' correlation, cyanopropyl column, Hodson & Williams 1988)

1.96, 1.86 (soil, quoted exptl., calculated-MCI χ and fragment contribution, Meylan et al. 1992)

- 1.61 (calculated- K_{OW} , Kollig 1993)
 1.96 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 2.28; 1.86 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1996)
 3.086, 2.21, 2.48, 2.374, 2.973 (first generation Eurosoils ES-1, ES-2, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV, Gawlik et al. 1998)
 2.801, 2.326, 2.145, 2.420 (second generation Eurosoils ES-1, ES-3, ES-4, ES-5, shake flask/batch equilibrium-HPLC/UV and HPLC- k' correlation, Gawlik et al. 2000)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} = 6.4$ h from using Henry's law constant for a model river of 1-m deep with 1 m/s current and 3 m/s wind (Lyman et al. 1982; quoted, Howard 1989);

$t_{1/2} = 3$ d in an experimental pond with spiked 4-chloroaniline (Schauerte et al. 1982; quoted, Howard 1989).

Photolysis:

Oxidation: rate constant k ; for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (8.3 \pm 0.42) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (flash photolysis-resonance fluorescence, Wahner & Zetzsch 1983)

$k_{OH}(\text{obs.}) = 83 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k_{OH}(\text{calc.}) = 34.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. in air (Atkinson 1985; Atkinson et al. 1985)

$k_{OH}(\text{calc.}) = 54 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k_{OH}(\text{obs.}) = 83 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)

$k_{OH} = (83 \text{ to } \sim 44) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295–296 K (Atkinson 1989)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 42.9 \text{ h}^{-1}$ (zebrafish, Zok et al. 1991)

$k_2 = 0.16 \text{ h}^{-1}$ (carp, Tsuda et al. 1993)

$k_1 = 17.74 \text{ h}$, $k_2 = 0.0465 \text{ h}$ (algae *Chlorella fusca*, Wang et al. 1996)

Half-Lives in the Environment:

Air: $t_{1/2} = 4.6$ h, based on estimated reaction rate with photochemically produced hydroxyl radical of 5×10^5 radicals/cm³ in atmosphere (Wahner & Zetzsch 1983; quoted, Howard 1989).

Surface water: estimated $t_{1/2} = 0.3$ – 3.0 d in river waters in case of a first order reduction process (Zoeteman et al. 1980);

72.1 mg/L total organic carbon (TOC) degraded to 92% TOC after 5 h illumination with a 250 watt tungsten lamp by photo-Fenton reaction in distilled water (Ruppert et al. 1993).

Groundwater: estimated $t_{1/2} = 30$ – 300 d in Rhine River (Zoeteman et al. 1980).

Sediment:

Soil:

Biota: $t_{1/2} = 4.3$ h in carp with excretion rate $k = 0.16 \text{ h}^{-1}$ (Tsuda et al. 1993).

TABLE 16.1.3.4.1

Reported vapor pressures of 4-chloroaniline at various temperatures and the coefficients for the vapor pressure equations

log P = A – B/(T/K)		(1)	ln P = A – B/(T/K)		(1a)		
log P = A – B/(C + t/°C)		(2)	ln P = A – B/(C + t/°C)		(2a)		
log P = A – B/(C + T/K)		(3)					
log P = A – B/(T/K) – C·log (T/K)		(4)

FIGURE 16.1.3.4.1 Logarithm of vapor pressure versus reciprocal temperature for 4-chloroaniline.

16.1.3.5 3,4-Dichloroaniline

Common Name: 3,4-Dichloroaniline

Synonym:

Chemical Name: 3,4-dichloroaniline

CAS Registry No: 95-76-1

Molecular Formula: $C_6H_5Cl_2N$, $C_6H_3NH_2Cl_2$

Molecular Weight: 162.017

Melting Point ($^{\circ}C$):

72.0 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

272.0 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

111.7 (calculated-density, Jaworska & Schultz 1993)

152.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

2.968, 3.0 (Perrin 1972)

2.00 (estimated, Wolff & Crossland 1985)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.346 (mp at $72^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

92.03 ($20^{\circ}C$, Wolff & Crossland 1985)

93.2; 740 (quoted exptl.; calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1.30 ($20^{\circ}C$, Wolff & Crossland 1985)

2.27 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 7.6189 - 3060.03/(T/K)$; temp range 420–545 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/mmHg) = -15.2685 - 3.3857 \times 10^3/(T/K) + 11.926 \cdot \log (T/K) - 1.9227 \times 10^{-2} \cdot (T/K) + 7.4179 \times 10^{-6} \cdot (T/K)^2$;
temp range 345–800 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

2.289 (calculated-P/C)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.69 (unpublished result, Leo et al. 1971, Hansch & Leo 1979)

2.12 (HPLC- k' correlation, Könemann et al. 1979)

2.78 ($20^{\circ}C$, shake flask-UV, Briggs 1981)

2.69, 2.67 (HPLC- k' correlation, Hammers et al. 1982)

2.62 (inter-laboratory studies, shake flask average, Eadsforth & Moser 1983)

2.30 (inter-laboratory studies, HPLC-RT correlation average, Eadsforth & Moser 1983)

2.14, 2.63 (HPLC- k' correlation, Eadsforth 1986)

2.69 (shake flask, Log P Database, Hansch & Leo 1987)

2.68 (recommended, Sangster 1993)

2.69 (recommended, Hansch et al. 1995)

2.69 (LOGPSTAR or CLOGP data, Sabljic et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

1.48 (zebrafish, Zok et al. 1991)

1.48; 2.02, 1.88, 1.75 (fish: quoted; calculated values- K_{OW} , Bintein et al. 1993)

Sorption Partition Coefficient, $\log K_{OC}$:

2.29 (20°C, sorption isotherm-GC, converted from K_{OM} multiplied by 1.724, Briggs 1981)

1.40 (calculated- K_{OW} , wet sediment, Wolff & Crossland 1985)

2.29 (Sabljic 1987)

2.05 (soil, quoted, Sabljic 1987)

2.29, 2.08 (soil, quoted, calculated-MCI χ and fragment contribution, Meylan et al. 1992)

2.29 (calculated-MCI $^1\chi$, Sabljic et al. 1995)

2.26, 2.39 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: first order rate constant $k(\text{calc}) = 5.0 \times 10^{-3} \text{ d}^{-1}$ (Wolff & Crossland 1985).

Photolysis: phototransformation rate constant $k = 0.12$ to 0.20 d^{-1} (Wolff & Crossland 1985).

Oxidation:

Hydrolysis: not expected to occur (Wolff & Crossland 1985).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 78.5 \text{ h}^{-1}$ (zebrafish, Zok et al. 1991)

Half-Lives in the Environment:

Surface water: overall rate of loss predicted from outdoor ponds was calculated based on direct phototransformation, and indirect phototransformation $k = 0.13$ to 0.22 d^{-1} corresponding to $t_{1/2} = 3.2$ to 5.3 d ; the observed rate of loss varied from 0.11 to 0.17 d^{-1} corresponding to $t_{1/2} = 4.1 - 6.3 \text{ d}$ (Wolff & Crossland 1985).

16.1.3.6 *o*-Toluidine (2-Methylbenzeneamine)

Common Name: *o*-Toluidine

Synonym: 2-aminotoluene, *o*-aminotoluene, 2-methylaniline, 2-methylbenzeneamine

Chemical Name: 2-aminotoluene, *o*-methylaniline, *o*-toluidine

CAS Registry No: 95-53-4

Molecular Formula: C_7H_9N , $C_6H_4(CH_3)NH_2$

Molecular Weight: 107.153

Melting Point ($^{\circ}C$):

−14.41 (Lide 2003)

Boiling Point ($^{\circ}C$):

200.3 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9984, 0.99430 (10, $25^{\circ}C$, Dreisbach 1955, Riddick et al. 1986)

0.9984 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

107.3 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

132.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.40, 4.447, 4.46 (Perrin 1972)

4.44 (Weast 1982–83)

4.45 (protonated cation + 1, Dean 1985)

4.43 (Sangster 1989)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

56.739, 44.597 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

7.535 (Dreisbach 1955)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

16330 ($20^{\circ}C$, shake flask-GC, Chiou 1981; Chiou & Schmedding 1981; Chiou et al. 1982)

15000 (quoted, Verschueren 1983)

16300 (calculated- K_{ow} , Müller & Klein 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($48.2^{\circ}C$, static method, measured range 48.2 – $199.7^{\circ}C$, Kahlbaum 1898)

42.72* (extrapolated-regression of tabulated data, temp range 44 – $199.7^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.60681 - 2033.6/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

7605* ($118.46^{\circ}C$, ebulliometry, measured range 118.46 – $200.30^{\circ}C$, Dreisbach & Shrader 1949)

42.26 (calculated by formula, Dreisbach 1955)

$\log(P/mmHg) = 7.28896 - 1768.7/(201.0 + t/^{\circ}C)$; temp range 103 – $320^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

$\log(P/atm) = [-0.2185 \times 12663.4/(T/K)] + 8.440371$; temp range 41 – $203.3^{\circ}C$ (Antoine eq., Weast 1972–73)

42.93 (extrapolated-Cox eq., Chao et al. 1983)

$\log(P/mmHg) = [1 - 473.369/(T/K)] \times 10^{[0.907135 - 6.44774 \times 10^{-4} \cdot (T/K) + 4.94693 \times 10^{-7} \cdot (T/K)^2]}$; temp range: 300.0 – $710.0 K$ (Cox eq., Chao et al. 1983)

13.33, 40.0 ($20^{\circ}C$, $30^{\circ}C$, quoted, Verschueren 1983)

33.96 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.20039 - 1623.158/(186.641 + t/^{\circ}\text{C})$; temp range 118.5–200.3°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

43.0 (selected lit., Riddick et al. 1986)

$\log (P/\text{mmHg}) = 6.73171 - 2033.6/(230.0 + t/^{\circ}\text{C})$; temp range: not specified (Antoine eq., Riddick et al. 1986)

34.18 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log (P/\text{mmHg}) = 7.08203 - 1627.72/(187.13 + t/^{\circ}\text{C})$; temp range 118–200°C (Antoine eq., Dean 1985, 1992)

36.46 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.26948 - 1672.87/(-81.47 + T/\text{K})$; temp range 391–474 K, (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 96.5685 - 6.2643 \times 10^3/(T/\text{K}) - 32.265 \cdot \log (T/\text{K}) + 1.2361 \times 10^{-2} \cdot (T/\text{K}) + 6.2915 \times 10^{-13} \cdot (T/\text{K})^2$; temp range 249–694 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

0.095 (calculated-P/C)

0.201 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.29 (shake flask-UV, Leo et al. 1971)

1.43 (HPLC- k' correlation, Carlson et al. 1975)

1.63 (RP-HPLC-RT correlation, Veith et al. 1979a)

1.42 (shake flask-UV at pH 7.5, Martin-Villodre et al. 1986)

1.34 (HPLC-RT correlation, average, Ge et al. 1987)

1.32 (shake flask, Log P Database, Hansch & Leo 1987)

1.32 (recommended, Sangster 1989)

1.44, 1.57 (shake flask, HP:C-RT correlation, Wang et al. 1989)

1.43 (recommended, Sangster 1993)

1.32 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

1.24 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant $k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radicals at 30°C in aquatic systems with $t_{1/2} = 0.8 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982);

rate constant $k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982);

photooxidation $t_{1/2} = 62.4 - 3480 \text{ h}$ in water, based on estimated rate constants for reactions of representative aromatic amines with OH and RO_2 radicals (Mill & Mabey 1985; quoted, Howard et al. 1991);

photooxidation $t_{1/2} = 0.394 - 3.94 \text{ h}$ in air, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Biodegradation: decomposition by a soil microflora in $> 64 \text{ d}$ (Alexander & Lustigman 1966; quoted, Verschuereen 1983);

aqueous aerobic $t_{1/2} = 24 - 168 \text{ h}$, based on aqueous aerobic screening test data (Baird et al. 1977; Sasaki 1978; quoted, Howard et al. 1991);

average biodegradation $k = 15.1 \text{ mg COD g}^{-1} \text{ h}^{-1}$ for 97.7% removal (Scow 1982);

aqueous anaerobic $t_{1/2} = 96 - 672 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 0.394 - 3.94$ h, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be < 1 d (Kelly et al. 1994).

Surface water: estimated $t_{1/2} = 1.0$ d for methylaniline in Rhine River in case of a first order reduction process (Zoeteman et al. 1980)

photooxidation $t_{1/2} = 62.4 - 3480$ h, based on estimated rate constants for reactions of representative aromatic amines with OH and RO₂ radicals (Mill & Mabey 1985; quoted, Howard et al. 1991).

Groundwater: $t_{1/2} = 48 - 336$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 24 - 168$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

FIGURE 16.1.3.6.1 Logarithm of vapor pressure versus reciprocal temperature for *o*-toluidine.

16.1.3.7 *m*-Toluidine (3-Methylbenzeneamine)

Common Name: *m*-Toluidine

Synonym: 3-aminotoluene, 3-methylbenzeneamine, 3-methylaniline

Chemical Name: 3-aminotoluene, *m*-amino-methylbenzene, *m*-methylaniline, *m*-toluidine

CAS Registry No: 108-44-1

Molecular Formula: $C_6H_4(CH_3)NH_2$

Molecular Weight: 107.153

Melting Point (°C):

−31.3 (Lide 2003)

Boiling Point (°C):

203.3 (Stull 1947; Weast 1982–83; Lide 2003)

Density (g/cm³ at 20°C):

0.9889 (Dreisbach 1955; Weast 1982–83)

Molar Volume (cm³/mol):

108.4 (20°C, Stephenson & Malanowski 1987)

132.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

4.66, 4.712, 4.72 (Perrin 1972)

4.73 (Weast 1982–83)

4.71 (protonated cation + 1, Dean 1985)

4.70 (Sangster 1989)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

57.283, 44.848 (25°C, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

7.08 (Dreisbach 1955)

3.891 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

15031 (20°C, shake flask-GC, Chiou 1981; Chiou & Schmedding 1981; Chiou et al. 1982)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* (49.8°C, static method, measured range 49.8–203.3°C, Kahlbaum 1898)

49.54* (extrapolated-regression of tabulated data, temp range 41–203.3°C, Stull 1947)

$\log(P/\text{mmHg}) = 7.616512 - 2052.0/(230 + t/^\circ\text{C})$ (Antoine eq., Dreisbach & Martin 1949)

7605* (121.77°C, ebulliometry, measured range 121.77–203.34°C, Dreisbach & Shrader 1949)

36.64 (calculated by formula, Dreisbach 1955)

$\log(P/\text{mmHg}) = 7.27435 - 1772.06/(200.0 + t/^\circ\text{C})$; temp range 105–320°C (Antoine eq. for liquid state, Dreisbach 1955)

$\log(P/\text{mmHg}) = [-0.2185 \times 12104.1/(T/K)] + 8.440371$; temp range 41–203°C (Antoine eq., Weast 1972–73)

33.49 (calculated-Cox eq., Chao et al. 1983)

$\log(P/\text{atm}) = [1 - 476.329/(T/K)] \times 10^4 \{0.923479 - 6.91988 \times 10^{-4} \cdot (T/K) + 5.41104 \times 10^{-7} \cdot (T/K)^2\}$; temp range: 280.0–705.0 K (Cox eq., Chao et al. 1983)

27.91 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/\text{kPa}) = 6.21454 - 1620.608/(203.346 + t/^\circ\text{C})$; temp range 121.9–203.4°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

25.66 (extrapolated-Antoine eq., Dean 1985, 1992)

- $\log (P/\text{mmHg}) = 7.09367 - 1631.43/(183.91 + t/^{\circ}\text{C})$; temp range 122–203°C (Antoine eq., Dean 1985, 1992)
 36.0 (quoted lit., Riddick et al. 1986)
 $\log (P/\text{kPa}) = 17.6292 - 3200.9/(T/\text{K}) - 3.323 \cdot \log (T/\text{K})$, temp range not specified (vapor pressure eq., Riddick et al. 1986)
 26.86 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.27299 - 1669.26/(-85.339 + T/\text{K})$; temp range 394–447 K (Antoine eq., Stephenson & Malanowski 1987)
 25.50 (calculated-Cox eq., Chao et al. 1990)
 $\log (P/\text{mmHg}) = 7.0317 - 3.2034 \times 10^3/(T/\text{K}) + 2.3006 \cdot \log (T/\text{K}) - 9.7791 \times 10^{-3} \cdot (T/\text{K}) + 4.6824 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 243–709 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

- 0.257 (calculated-P/C)
 0.169 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 1.40 (shake flask-UV, Fujita et al. 1964)
 1.43 (HPLC- k' correlation, Carlson et al. 1975)
 1.42 (20°C, shake flask-UV, Briggs 1981)
 1.43 (shake flask, Log P Database, Hansch & Leo 1987)
 1.40 (recommended, Sangster 1989)
 1.49, 1.37 (shake flask, HPLC-RT correlation, Wang et al. 1989)
 1.40 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 1.41 (soil, quoted obs. as $\log K_{\text{OM}}$, Sabljic 1987)
 1.65 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant $k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 0.8 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982);

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982).

Biodegradation: decomposition by a soil microflora in 8 d (Alexander & Lustigman 1966; quoted, Verschueren 1983);

average biodegradation rate of $30.0 \text{ mg COD g}^{-1} \text{ h}^{-1}$ for 97.7% removal (Scow 1982).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Surface water: estimated $t_{1/2} = 1.0 \text{ d}$ for methylaniline in Rhine River in case of a first order reduction process (Zoeteman et al. 1980)

16.1.3.8 *p*-Toluidine (4-Methylbenzeneamine)

Common Name: *p*-Toluidine

Synonym: 4-aminotoluene, 4-methylaniline, 4-methylbenzenamine

Chemical Name: 4-aminotoluene, *p*-amino-methylbenzene, *p*-methylaniline, *p*-toluidine

CAS Registry No: 106-49-0

Molecular Formula: $C_6H_4(CH_3)NH_2$

Molecular Weight: 107.153

Melting Point ($^{\circ}C$):

43.6 (Lide 2003)

Boiling Point ($^{\circ}C$):

200.4 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9619 ($20^{\circ}C$, Weast 1982–83)

1.043 (Verschueren 1983)

Molar Volume (cm^3/mol):

132.4 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

5.02, 5.08, 5.084 (Perrin 1972)

5.08 (Weast 1982–83; Sangster 1989)

5.08 (protonated cation + 1, Dean 1985)

5.17 (shake flask-HPLC/UV, Johnson & Westall 1990)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

56.195, 44.271 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.32 (Tsonopoulos & Prausnitz 1971)

18.91 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

54.81 (Tsonopoulos & Prausnitz 1971)

57.61 (observed, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.657 (mp at $43.6^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ as indicated):

65400 (20 – $25^{\circ}C$, shake flask-gravimetric, Dehn 1917)

8965 (Seidell 1941, 1952)

7400 ($21^{\circ}C$, Verschueren 1983)

6643, 5370 ($20^{\circ}C$, shake flask-UV, calculated, Hashimoto et al. 1984)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($46.9^{\circ}C$, static method, measured range 46.9 – $200.4^{\circ}C$, Kahlbaum 1898)

$\log(P/mmHg) = -2597/(T/K) + 8.366$ (isoteniscope method, temp range not specified, Kobe et al. 1941)

46.27* (extrapolated-regression of tabulated data, temp range 42 – $200.4^{\circ}C$, Stull 1947)

44.70 (calculated by formula, Dreisbach 1955)

$\log(P/mmHg) = 7.25173 - 1755.0/(201.0 + t/^{\circ}C)$; temp range 103 – $330^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

$\log(P/atm) = [-0.2185 \times 12428.6/(T/K)] + 8.748585$; temp range 42 – $200.4^{\circ}C$ (Antoine eq., Weast 1972–73)

38.13 (calculated-Cox eq., Chao et al. 1983)

- $\log (P/\text{mmHg}) = [1 - 473.445/(T/K)] \times 10^{\{0.915691 - 6.57014 \times 10^{-4} \cdot (T/K) + 5.11261 \times 10^{-7} \cdot (T/K)^2\}}$; temp range 290.0–700.0 K (Cox eq., Chao et al. 1983)
 40.17 (calculated-Antoine eq., Dean 1985, 1992)
 $\log (P/\text{mmHg}) = 7.26022 - 1758.55/(201.0 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Dean 1985, 1992)
 45.0 (quoted lit., Riddick et al. 1986)
 $\log (P/\text{kPa}) = 18.2818 - 3269.3/(T/K) - 3.877 \cdot \log (T/K)$; temp range not specified (vapor pressure eq., Riddick et al. 1986)
 27.03 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.17451 - 1585.0/(-93.44 + T/K)$; temp range 393–474 K (Antoine eq., Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = -13.9927 - 2.5795 \times 10^3/(T/K) - 10.823 \cdot \log (T/K) - 1.7705 \times 10^{-2} \cdot (T/K) + 7.6741 \times 10^{-6} \cdot (T/K)^2$; temp range 317–693 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

- 0.656 (calculated-P/C)
 0.0768 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 1.39 (shake flask-UV, Fujita et al. 1964)
 1.41 (HPLC- k' correlation, Carlson et al. 1975)
 1.56 (shake flask-UV, Ezumi & Kubota 1980)
 1.40 (20°C , shake flask-UV, Briggs 1981)
 1.44 ± 0.03 (HPLC-RV correlation-ALPM, Garst & Wilson 1984)
 1.42 (HPLC- k' correlation, Haky & Young 1984)
 1.39 (shake flask-UV at pH 7.5, Martin-Villodre et al. 1986)
 1.41 (HPLC-RT correlation, average, Ge et al. 1987)
 1.39 (shake flask, Leahy et al. 1989)
 1.39 (recommended, Sangster 1989, 1993)
 1.38, 1.39 (shake flask, HPLC-RT correlation, Wang et al. 1989)
 1.40 (shake flask-HPLC/UV, Johnson & Westall 1990)
 1.40 (shake flask-UV, Roberts et al. 1991)
 1.40 (32°C , shake flask-UV, pH 7, Takahashi et al. 1993)
 1.39 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.51, 2.70, 2.71 (Morocco soil, Oakville soil, Milford soil, Graveel et al. 1986)
 1.66 (soil, quoted obs. as $\log K_{OM}$, Sabljic 1987)
 2.74, 2.22, 2.20 (Podzol soil, Alfisol soil, sediment, von Oepen et al. 1991)
 1.24 (calculated- K_{OW} , Kollig 1993)
 1.90 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 2.21; 1.86 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1996)
 3.28, 2.01, 2.30, 2.084 (first generation Eurosoils ES-1, ES-2, ES-3, ES-4, shake flask/batch equilibrium-HPLC/UV, Gawlik et al. 1998)
 2.138, 2.133, 2.212, 2.041 (second generation Eurosoils ES-1, ES-2, ES-3, ES-4, shake flask-batch equilibrium-HPLC/UV and HPLC- k' correlation, Gawlik et al. 2000)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

- Volatilization:
 Photolysis:
 Hydrolysis:

Oxidation: rate constant $k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 0.8 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982);

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982).

Biodegradation: decomposition by a microflora in 4 d (Alexander & Lustigman 1966; quoted, Verschueren 1983); average biodegradation rate of $20 \text{ mg COD g}^{-1} \text{ h}^{-1}$ for 97.7% removal (Scow 1982).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Surface water: estimated $t_{1/2} = 1.0 \text{ d}$ for methylaniline in Rhine River in case of a first order reduction process (Zoeteman et al. 1980)

FIGURE 16.1.3.8.1 Logarithm of vapor pressure versus reciprocal temperature for *p*-toluidine.

16.1.3.9 N,N'-Dimethylaniline

Common Name: N,N'-Dimethylaniline

Synonym: N,N'-dimethylbenzenamine

Chemical Name: N,N'-dimethylaniline

CAS Registry No: 121-69-7

Molecular Formula: $C_8H_{11}N$, $C_6H_5N(CH_3)_2$

Molecular Weight: 121.180

Melting Point ($^{\circ}C$):

2.42 (Lide 2003)

Boiling Point ($^{\circ}C$):

194.0 (Weast 1982–83)

194.15 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9557 (Weast 1982–83)

Molar Volume (cm^3/mol):

154.6 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK:

5.15 (pK_{BH}^{+} , Riddick et al. 1986)

5.10 (Sangster 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.42 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

41.46 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

1105 (shake flask-GC, Chiou et al. 1982)

1540, 1680 (20, $30^{\circ}C$, shake flask-GC/TC, measured range 0 – $90^{\circ}C$, Stephenson 1993c)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

106.3 (extrapolated-regression of tabulated data, temp range 20.0 – $193.1^{\circ}C$, Stull 1947)

133.3 ($29.5^{\circ}C$, Stull 1947)

83.90 (calculated-Antoine eq., Boublik et al. 1973)

$\log(P/atm) = [-0.2185 \times 11320.4/(T/K)] + 8.197379$; temp range: 29.5 – $193^{\circ}C$, (Antoine eq., Weast 1972–73)

68.95 (calculated-Cox eq., Chao et al. 1983)

$\log(P/mmHg) = [1 - 466.445/(T/K)] \times 10^{\{0.909397 - 7.07673 \times 10^{-4} \pm (T/K) + 5.69581 \times 10^{-7} \pm (T/K)^2\}}$; temp range 275.0 – $685.0 K$ (Cox eq., Chao et al. 1983)

84.5 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.5031 - 1865.084/(211.171 + t/^{\circ}C)$; temp range 71.02 – $196.8^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

83.91 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 6.91048 - 946.35/(246.68 + t/^{\circ}C)$; temp range -87 to $7^{\circ}C$ (Antoine eq., Dean 1985, 1992)

670.0 (quoted from Stull 1947, Riddick et al. 1986)

107.0 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.07329 - 2301.63/(-12.001 + T/K)$; temp range 302 – $467 K$ (liquid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.55663 - 1864.075/(-55.854 + T/K)$; temp range 363 – $418 K$ (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)

$$\log (P/\text{mmHg}) = 2-.177 - 3.1095 \times 10^3/(T/K) - 4.0127 \cdot \log (T/K) + 5.8538 \times 10^{-10} \cdot (T/K) + 3.5387 \times 10^{-7} \cdot (T/K)^2;$$

temp range 276–687 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$):

11.73 (calculated-P/C)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

2.31 (shake flask-UV, Fujita et al. 1964)
 2.62 (shake flask-UV at pH 7.4, Rogers & Cammarata 1969)
 1.66 (shake flask-UV, Leo et al. 1971)
 2.29 (shake flask-UV, Yaguzhinskii et al. 1973)
 2.30 (shake flask at pH 7, Unger et al. 1978)
 2.43 (HPLC-RT correlation, Miyake et al. 1986)
 2.28 (RP-HPLC-RT correlation, ODS column with masking agent, Bechalany et al. 1989)
 2.32 (CPC correlation, El Tayar et al. 1991)
 2.31 (recommended, Sangster 1993)
 2.31 (recommended, Hansch et al. 1995)
 2.05 (microemulsion electrokinetic chromatography-retention factor correlation, Poole et al. 2000)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

1.99; 2.53; 2.06 (Alfisol soil; Podzol soil; sediment, von Oepen et al. 1991)
 2.26, 1.89 (soil, quoted, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
 2.26 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k ; for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 0.8 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982)

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982)

$k_{\text{OH}}^*(\text{exptl}) = (1.48 \pm 0.11) \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, measured range 278–464 K; $k_{\text{O}_3} = (9.1 \pm 1.0) \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ (relative rate method, Atkinson et al. 1987)

$k_{\text{OH}} = 1.5 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with atmospheric lifetimes of 1.9 h in clean troposphere and 1.0 h in moderately polluted atmosphere; $k_{\text{O}_3} = 9.1 \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with atmospheric lifetimes of 1.8 d in clean troposphere and 14 h in moderately polluted atmosphere at room temp. (Atkinson et al. 1987)

$k_{\text{OH}}(\text{calc}) = 4.66 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs}) = 1.48 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}}(\text{calc}) = 1.78 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

Hydrolysis:

Biodegradation: aerobic $t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aqueous screening test data and anaerobic $t_{1/2} = 2880\text{--}17280 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric lifetimes of 1.9 h in clean troposphere and 1.0 h in moderately polluted atmosphere, based on the gas-phase reaction with hydroxyl radical in air at room temp.; atmospheric lifetimes of 1.8 d in clean

troposphere and 14 h in moderately polluted atmosphere, based on the gas-phase reaction with O_3 in air at room temp. (Atkinson et al. 1987);

$t_{1/2} = 2.7\text{--}21$ h, based on photooxidation half-life in air (Howard et al. 1991);

atmospheric transformation lifetime was estimated to be < 1 d (Kelly et al. 1994).

Surface water: estimated $t_{1/2} = 2.3$ d in Rhine River in case of a first order reduction process (Zoeteman et al. 1980)

$t_{1/2} = 19.3\text{--}1925$ h, based on reaction with singlet oxygen in aqueous solution (Howard et al. 1991)

Groundwater: $t_{1/2} = 1344\text{--}8640$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biota:

16.1.3.10 2,6-Xylidine (2,6-Dimethylbenzeneamine)

Common Name: 2,6-Xylidine

Synonym: 2,6-dimethylaniline, 2,6-dimethylbenzeneamine

Chemical Name: 2,6-dimethylaniline

CAS Registry No: 87-62-7

Molecular Formula: $C_8H_{11}N$, 2,6- $(CH_3)_2C_6H_3NH_2$

Molecular Weight: 121.180

Melting Point ($^{\circ}C$):

11.20 (Weast 1982–83; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

214.0 (at 739 mm Hg, Weast 1982–83; Verschueren 1983)

215 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9842 (Weast 1982–83; Riddick et al. 1986)

Molar Volume (cm^3/mol):

123.1 ($20^{\circ}C$, calculated-density)

154.6 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK :

3.95 (pK_{BH}^{+} , Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

slightly soluble (Dean 1985; Budavari 1989)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

43.03 (extrapolated-regression of tabulated data, temp range 44 – $217.9^{\circ}C$, Stull 1947)

$\log(P/atm) = [1 - 490.795/(T/K)] \times 10^{0.926009 - 6.89676 \times 10^{-4} \cdot (T/K) + 5.31053 \times 10^{-7} \cdot (T/K)^2}$; temp range: 285.0 – $720.0\ K$ (Cox eq., Chao et al. 1983)

17.33 (Howard et al. 1986)

670.0 (quoted from Stull 1947, Riddick et al. 1986)

35.99 (calculated-solvatochromic parameters, Banerjee et al. 1990)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

17.28 (calculated- P/C from selected value)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.96 (calculated, Verschueren 1983)

1.91 (calculated-CLOGP, Jäckel & Klein 1991)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant $k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 0.8 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982); $k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982);photooxidation $t_{1/2} = 0.33\text{--}3.3 \text{ h}$ in air, based on estimated reaction rate constant with OH radical (Atkinson 1987; selected, Howard et al. 1991) and photooxidation $t_{1/2} = 62.4\text{--}3480 \text{ h}$ in water, based on reaction rate constants of amine class with $\text{RO}_2\cdot$ and OH radicals in water (Güesten et al. 1981; Mill & Mabey 1985; selected, Howard et al. 1991).

Hydrolysis: no hydrolyzable group (Howard et al. 1991).

Biodegradation: aqueous aerobic biodegradation $t_{1/2} = 672\text{--}4320 \text{ h}$, based on a biological screening study (Baird et al. 1977; selected Howard et al. 1991) and a soil degradation study (Bollag et al. 1978; selected, Howard et al. 1991); aqueous anaerobic biodegradation $t_{1/2} = 2688\text{--}17280 \text{ h}$, based on estimated aqueous biodegradation half-lives (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.33\text{--}3.3 \text{ h}$, based on estimated photooxidation half-lives in air from estimated reaction rate constant with OH radical in air (Atkinson 1987; selected, Howard et al. 1991).Surface water: estimated $t_{1/2} = 2.0 \text{ d}$ for dimethylaniline in Rhine River in case of a first order reduction process (Zoeteman et al. 1980) $t_{1/2} = 62.4\text{--}3480 \text{ h}$, based on photooxidation half-life in water (Howard et al. 1991).Groundwater: $t_{1/2} = 1344\text{--}8640 \text{ h}$, based on estimated aqueous aerobic biodegradation half-lives (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 72\text{--}7584 \text{ h}$, based on soil persistence and soil biodegradation studies (Bollag et al. 1978; Medvedev & Davidov 1981; selected, Howard et al. 1991).

Biota:

16.1.3.11 Diphenylamine

Common Name: Diphenylamine

Synonym: N-diphenylamine, N-phenyl aniline, DPA

Chemical Name: N-diphenylamine, diphenylamine

CAS Registry No: 122-39-4

Molecular Formula: $C_{12}H_{11}N$, $C_6H_5NHC_6H_5$

Molecular Weight: 169.222

Melting Point ($^{\circ}C$):

53.2 (Lide 2003)

Boiling Point ($^{\circ}C$):

302.0 (Stull 1947; Weast 1982–83; Verschueren 1983; Dean 1985; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.160 (Weast 1982–83; Dean 1985)

Molar Volume (cm^3/mol):

145.9 ($20^{\circ}C$ calculated-density)

200.3 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

0.89 (Perrin 1972)

0.90 (protonated cation + 1, Dean 1985)

0.78 (Sangster 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.53 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

53.56 (Tsonopoulos & Prausnitz 1971)

54.81; 56.5 (exptl., calculated, Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F: 0.529 (mp at $53.2^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ as indicated):

150 (20 – $25^{\circ}C$, shake flask-gravimetric method, Dehn 1917)

308 (Briggs 1981)

48 ($20^{\circ}C$, shake flask and membrane filter-fluorophotometric, Hashimoto et al. 1982)

52, 54 ($20^{\circ}C$, shake flask and glass fiber filters-fluorophotometric, Hashimoto et al. 1982)

300 (Verschueren 1983)

53 ($20^{\circ}C$, Yalkowsky et al. 1987)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.5682* (extrapolated-regression of tabulated data, temp range 108.3 – $302^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 14920.3/(T/K)] + 8.564067$; temp range 108.3 – $302^{\circ}C$ (Antoine eq., Weast 1972–73)

$\log(P/atm) = [1 - 575.114/(T/K)] \times 10^4 \{0.936992 - 6.17195 \times 10^{-4} \cdot (T/K) + 4.32696 \times 10^{-7} \cdot (T/K)^2\}$; temp range 335.0 – $670.0\ K$ (Cox eq., Chao et al. 1983)

0.0612 (calculated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 12.704 - 5043.9/(T/K)$; temp range 298 – $323\ K$ (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.15045 - 2778.28/(-35.102 + T/K)$; temp range 381 – $575\ K$ (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.5746 - 2430.7/(-41.15 + T/K)$; temp range 573 – $673\ K$ (liquid, Antoine eq.-III, Stephenson & Malanowski 1987)

$\log(P/mmHg) = 9.7736 - 3.9008 \times 10^3/(T/K) + 0.91207 \cdot \log(T/K) - 5.898 \times 10^{-3} \cdot (T/K) + 2.3012 \times 10^{-6} \cdot (T/K)^2$; temp range 326 – $817\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

- 0.285 (calculated-P/C, Meylan & Howard 1991)
- 0.106 (estimated-bond contribution, Meylan & Howard 1991)
- 0.035 (calculated-P/C from selected values)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 3.23 (shake flask-UV, pH 7.4, Rogers & Cammarata 1969)
- 3.34 (unpublished result, Leo et al. 1971)
- 3.34, 3.50, 3.72 (unpublished results, Rekker 1977)
- 2.37 (RP-HPLC-RT correlation, Veith et al. 1979a)
- 3.45 (Hansch & Leo 1979)
- 3.42 (shake flask-UV, Briggs 1981)
- 3.37 (inter-laboratory shake flask average, Eadsforth & Moser 1983)
- 3.72 ± 0.03 (HPLC-RV correlation-ALPM, Garst & Wilson 1984)
- 2.69 (HPLC-RT correlation, average, Ge et al. 1987)
- 3.42 (shake flask, Log P Database, Hansch & Leo 1987)
- 3.50 (recommended, Sangster 1989, 1993)
- 3.70, 3.68 (shake flask, HPLC-RT correlation, Wang et al. 1989)
- 3.50 (recommended, Hansch et al. 1995)
- 2.99, 3.13, 3.04, 3.18 (HPLC- k' correlation, different combinations of stationary and mobile phases under isocratic conditions, Makovskaya et al. 1995)
- 3.35 (microemulsion electrokinetic chromatography-retention factor correlation, Poole et al. 2000)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

- 7.64 (calculated- S_{oct} and vapor pressure P , Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

- 1.48 (fathead minnow, Veith et al. 1979b)
- 1.48, 2.10 (quoted, calculated- K_{OW} , Mackay 1982)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 2.78 (sorption isotherm-GC, converted from K_{OM} organic matter-water in various soils, Briggs 1981)
- 2.78, 3.28 (soil, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
- 3.30 (calculated- K_{OW} , Kollig 1993)
- 2.70 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
- 2.80, 2.93 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant $k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 0.8 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982);

$k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982);

photooxidation $t_{1/2} = 31\text{--}1740 \text{ h}$ in water, based on photooxidation rate constants with OH and RO_2 radicals for the amine class (Mill & Mabey 1985; Güesten et al. 1981; selected, Howard et al. 1991);

photooxidation $t_{1/2} = 0.247\text{--}2.47 \text{ h}$, based on estimated rate data for the reaction with hydroxyl radicals in air (Atkinson 1987; selected, Howard et al. 1991).

Hydrolysis: rate constant $k = 1.2 \times 10^{10} \text{ L mol}^{-1} \text{ s}^{-1}$ for reactions with hydroxyl radical in aqueous solution, (Buxton et al. 1986; quoted, Armbrust 2000);

measured hydroxy radical rate constant $k = 4.9 \times 10^{13} \text{ M}^{-1} \cdot \text{h}^{-1}$ (Armbrust 2000)

Biodegradation: aqueous aerobic $t_{1/2} = 168\text{--}672 \text{ h}$, based on estimated aqueous aerobic biodegradation screening test data (Malaney 1960; quoted, Howard et al. 1991);

aqueous anaerobic $t_{1/2} = 672\text{--}2688$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 0.247\text{--}2.47$ h, based on estimated rate data for the reaction with hydroxyl radical in air (Atkinson 1987; selected, Howard et al. 1991).

Surface water: photooxidation $t_{1/2} = 31\text{--}1740$ h in water, based on photooxidation rate constants with OH and RO_2 radicals for the amine class (Mill & Mabey 1985; Güesten et al. 1981; selected, Howard et al. 1991); $t_{1/2} = 31\text{--}672$ h, based on estimated unacclimated aqueous aerobic degradation half-life and photooxidation half-life in water (Howard et al. 1991).

Groundwater: $t_{1/2} = 336\text{--}1344$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 168\text{--}672$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

FIGURE 16.1.3.11.1 Logarithm of vapor pressure versus reciprocal temperature for diphenylamine.

16.1.3.12 Benzidine

Common Name: Benzidine

Synonym: *p,p'*-bianiline, 4,4'-diaminobiphenyl, 4,4'-biphenyldiamine, (1,1'-biphenyl)-4,4'-diamine

Chemical Name: *p*-benzidine

CAS Registry No: 92-87-5

Molecular Formula: C₁₂H₁₂N₂, NH₂C₆H₄C₆H₄NH₂

Molecular Weight: 184.236

Melting Point (°C):

128 (Weast 1982–83)

120 (Lide 2003)

Boiling Point (°C):

400 (Weast 1982–83)

401 (Lide 2003)

Density (g/cm³ at 20°C):

1.250 (Verschuereen 1983)

Molar Volume (cm³/mol):

213.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a:

4.66 (pK₁), 3.57 (pK₂) (30°C, Perrin 1965; quoted, Mabey et al. 1982; Howard 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.117 (mp at 120°C)

Water Solubility (g/m³ or mg/L at 25°C as indicated):

400 (12°C, Verschuereen 1977, 1983)

520 (Shriner et al. 1978)

360 (24°C at pH 5.9, shake flask-LSC, Means et al. 1980)

276 (20°C, Schmidt-Bleek et al. 1982)

359 (Gerstl & Helling 1987)

Vapor Pressure (Pa at 25°C):

0.724 (calculated-Trouton's rule, Mabey et al. 1982)

1.0 × 10⁻⁶ (20°C, Schmidt-Bleek et al. 1982)

Henry's Law Constant (Pa·m³/mol at 25°C or as indicated):

3.93 × 10⁻⁶ (estimated, Hine & Mookerjee 1975)

0.0394 (calculated-P/C at 12°C, Mabey et al. 1982)

4.60 × 10⁻⁷ (calculated-P/C, this work)

Octanol/Water Partition Coefficient, log K_{OW}:

1.34 (shake flask, Korenman 1971)

1.34 (recommended, Sangster 1993)

1.34 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF:

1.74, 2.66, 2.81, 3.4 (fish, mosquitoes, snail, algae; Lu et al. 1977)

1.60 (bluegills, USEPA 1980; quoted, Howard 1989)

1.00 (microorganisms-water, calculated-K_{OW}, Mabey et al. 1982)

1.90, 2.93, 3.08 (golden ide, algae, activated sludge, Freitag et al. 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

- 1.66 (soil/sediment, equilibrium sorption isotherm by shake flask-LSC at pH 5.9, Means et al. 1980)
- 1.02 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
- 5.95; 5.68; 5.35; 5.91 (Russell soil; Chalmers soil; Kokomo soil; Milford soil, Graveel et al. 1986)
- 3.00 (calculated-MCI χ , Gerstl & Helling 1987)
- 3.46, 3.44 (soil, quoted, calculated-MCI χ and fragment contribution, Meylan et al. 1992)
- 1.26 (calculated- K_{OW} , Kollig 1993)
- 3.46 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: aqueous oxidation rate constants for singlet oxygen $k < 4 \times 10^7 \text{ M}^{-1} \text{ h}^{-1}$ and for peroxy radical of $1.1 \times 10^8 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C (Mabey et al. 1982);

photooxidation $t_{1/2} = 0.312\text{--}3.12 \text{ h}$, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Biodegradation: aqueous aerobic $t_{1/2} = 48\text{--}192 \text{ h}$, based on aerobic soil die-away test data (Lu et al. 1977; quoted, Howard et al. 1991);

overall biodegradation $t_{1/2} = 76 \text{ d}$, when in sludge was applied to a sandy loam soil in a biological soil reactor and worked into the top 20 cm of soil (Kincannon & Lin 1985; quoted, Howard 1989);

aqueous aerobic $t_{1/2} = 192\text{--}768 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: rate constant for bacterial transformation of $1 \times 10^{-10} \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.312\text{--}3.12 \text{ h}$, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

estimated $t_{1/2} \sim 1 \text{ d}$ for the reaction with hydroxyl radical and ozone (Howard 1989);

atmospheric transformation lifetime was estimated to be $< 1 \text{ d}$ (Kelly et al. 1994).

Surface water: estimated $t_{1/2} \sim 1 \text{ d}$ for the reaction with radicals and redox reactions with naturally occurring cations, etc. and perhaps with photodegradation (Howard 1989);

$t_{1/2} = 31.2\text{--}192 \text{ h}$, based on estimated photooxidation half-life in water and estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 96\text{--}484 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} < 10 \text{ d}$ in soil (USEPA 1979; quoted, Ryan et al. 1988);

$t_{1/2} = 48\text{--}192 \text{ h}$, based on aerobic soil die-away test data (Lu et al. 1977; quoted, Howard et al. 1991);

overall biodegradation $t_{1/2} = 76 \text{ d}$, when in sludge was applied to a sandy loam soil in a biological soil reactor and worked into the top 20 cm of soil (Kincannon & Lin 1985; quoted, Howard 1989).

Biota: depuration $t_{1/2} \sim 7 \text{ d}$ from bluegills (Lu et al. 1977; quoted, Howard 1989).

16.1.3.13 3,3'-Dichlorobenzidine

Common Name: 3,3'-Dichlorobenzidine

Synonym: 3,3'-dichloro-4,4'-diamino(1,1'-biphenyl), DCB

Chemical Name: 3,3'-dichlorobenzidine

CAS Registry No: 91-94-1

Molecular Formula: $C_{12}H_{10}Cl_2N_2$, $NH_2C_6H_3(Cl)C_6H_3(Cl)NH_2$

Molecular Weight: 253.126

Melting Point ($^{\circ}C$):

132.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

254.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_b :

11.7 (Kollig 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.0882 (mp at $132.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

4.00 ($22^{\circ}C$, as dihydrochloride, Banerjee et al. 1978)

3.99 ($22^{\circ}C$, at pH 6.9 as DCB.2HCl, quoted, Verschueren 1983)

3.11 (shake flask-UV/LSC, Banerjee et al. 1980)

Vapor Pressure (Pa at $25^{\circ}C$):

0.00133 (estimated, Mabey et al. 1982)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.0811 (calculated-P/C, Mabey et al. 1982)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.02 (calculated as per Leo et al.1971)

3.51 ($23^{\circ}C$, shake flask, Banerjee et al. 1980)

3.35 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)

3.51 (recommended, Sangster 1993)

3.51 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

2.70 (bluegill sunfish, Appleton & Sikka 1980)

2.97 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

2.79, 2.97, 3.49 (fish, algae, activated sludge, Freitag et al. 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

3.19 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

4.35, 3.87 (soil: quoted, calculated-MCI χ and fragment contribution, Meylan et al. 1992)

3.30 (calculated- K_{OW} , Kollig 1993)

4.35 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

direct aqueous photolysis rate constant $k = 2.1 \times 10^{-6} \text{ h}^{-1}$ in summer at 40°N latitude (Mabey et al. 1982); both aqueous and atmospheric photolysis $t_{1/2} = 0.025\text{--}0.075 \text{ h}$, based on direct photolysis in distilled water in midday summer sunlight (Banerjee et al. 1978; Sikka et al. 1978; quoted, Callahan et al. 1979; Howard et al. 1991) and approximate winter sunlight direct photolysis half-life (Banerjee et al. 1978; Sikka et al. 1978; Lyman et al. 1982; quoted, Howard et al. 1991).

Hydrolysis:

Oxidation: aqueous oxidation rate constants for singlet oxygen $k < 4 \times 10^7 \text{ M}^{-1} \text{ h}^{-1}$ and for peroxy radical $k < 4 \times 10^7 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C (Mabey et al. 1982);

photooxidation $t_{1/2} = 31.2\text{--}1740 \text{ h}$ in water, based on estimated rate constants for reactions with OH and RO_2 radicals in water (Mill & Mabey 1985; quoted, Howard et al. 1991);

photooxidation $t_{1/2} = 0.905\text{--}9.05 \text{ h}$ in air, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991)

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320 \text{ h}$, based on lake die-away study test data (Appleton et al. 1978; quoted, Howard et al. 1991) and a soil die-away test (Boyd et al. 1984; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2688\text{--}17280 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: rate constant for bacterial transformation $k = 3 \times 10^{-12} \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.905\text{--}9.05 \text{ h}$, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

estimated $t_{1/2} \sim 1 \text{ d}$ for the reaction with hydroxyl radical and ozone (Howard 1989);

atmospheric transformation lifetime by photolysis was estimated to be $< 1 \text{ d}$ (Kelly et al. 1994).

Surface water: $t_{1/2} = 0.025\text{--}0.075 \text{ h}$, based on direct photolysis in distilled water in midday summer sunlight (Banerjee et al. 1978; Sikka et al. 1978; quoted, Howard et al. 1991) and approximate winter sunlight direct photolysis half-life (Banerjee et al. 1978; Sikka et al. 1978; Lyman et al. 1982; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}8640 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment: $t_{1/2} = 30 \text{ min}$ by suspended microcrystalline clays may be considered the most important fate process in the aquatic environment (Callahan et al. 1979).

Soil: $t_{1/2} = 672\text{--}4320 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

16.1.3.14 N,N'-Bianiline

Common Name: N,N'-Bianiline

Synonym: 1,2-diphenylhydrazine, hydrazobenzene

Chemical Name: 1,2-diphenylhydrazine, hydrazobenzene

CAS Registry No: 122-66-7

Molecular Formula: $C_{12}H_{12}N_2$, $C_6H_5NHNHC_6H_5$

Molecular Weight: 184.236

Melting Point ($^{\circ}C$):

131 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

293 (as azobenzene, IARC 1975)

Density (g/cm^3 at $20^{\circ}C$):

1.158 ($16^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

213.0 (calculated-Le Bas method at normal boiling point)

Dissociation constant pK_b :

13.2 (Kollig 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F: 0.0912 (mp at $131^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.252 ($20^{\circ}C$, as azobenzene, Takagishi et al. 1968)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00347 (quoted, Mabey et al. 1982)

$\log(P/mmHg) = 16.8982 - 5.0039 \times 10^3/(T/K) - 0.35846 \cdot \log(T/K) - 9.9629 \times 10^{-3} \cdot (T/K) + 4.2938 \times 10^{-6} \cdot (T/K)^2$;
temp range 404–573 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

3.45×10^{-4} (calculated-P/C, Mabey et al. 1982)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.82 (shake flask-UV as for azobenzene, Fujita et al. 1964)

3.03 (calculated as per Leo et al. 1971, Callahan et al. 1979)

2.94 (shake flask, Hansch & Leo 1979; 1987)

2.94 (recommended, Sangster 1993)

2.94 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

2.46 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

2.62 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

1.40 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: aqueous oxidation rate constants for singlet oxygen $k < 4 \times 10^7 \text{ M}^{-1} \text{ h}^{-1}$ and for peroxy radical, $k < 1 \times 10^9 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C (Mabey et al. 1982);

photooxidation $t_{1/2} = 31 - 1740 \text{ h}$, based on photooxidation rate constants with OH and RO_2 radicals for the amine class (Güesten et al. 1981; Mill & Mabey 1985; quoted, Howard et al. 1991);

photooxidation $t_{1/2} = 0.3 - 3.0 \text{ h}$ in air, based on estimated rate data for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Biodegradation: aqueous aerobic $t_{1/2} = 672 - 4320 \text{ h}$, based on acclimated aerobic aqueous screening test data (Malaney 1960; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2880 - 17280 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: bacterial transformation $k = 1 \times 10^{-10} \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 0.3 - 3.0 \text{ h}$, based on estimated rate data for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

atmospheric transformation lifetime was estimated to be $< 1 \text{ d}$ (Kelly et al. 1994).

Surface water: photooxidation $t_{1/2} = 31 - 1740 \text{ h}$, based on photooxidation rate constants with OH and RO_2 radicals for the amine class (Güesten et al. 1981; Mill & Mabey 1985; quoted, Howard et al. 1991).

Groundwater: $t_{1/2} = 1344 - 8640 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672 - 4320 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

16.1.3.15 α -Naphthylamine (1-Aminonaphthalene)

Common Name: 1-Naphthylamine

Synonym: 1-naphthalenamine, α -naphthylamine, 1-NA, 1-aminonaphthalene, naphthalidine

Chemical Name: 1-naphthalenamine

CAS Registry No: 134-32-7

Molecular Formula: $C_{10}H_7NH_2$

Molecular Weight: 143.185

Melting Point ($^{\circ}C$):

49.2 (Lide 2003)

Boiling Point ($^{\circ}C$):

300.7 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1229 ($25^{\circ}C$, Weast 1982–8)

1.123 (Dean 1985)

Molar Volume (cm^3/mol):

161.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

3.92 (Sangster 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

14.23 ± 0.105 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

44.35 ± 3.35 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.579 (mp at $49.2^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1700 (Verschueren 1983)

590 parts in water (Budavari 1989)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.803 (extrapolated-regression of tabulated data, temp range 104.3 – $300.8^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 14529.5/(T/K)] + 8.29900$; temp range 104.3 – $300.8^{\circ}C$ (Antoine eq., Weast 1972–73)

0.557 (extrapolated-Cox eq., Chao et al. 1983)

$\log(P/atm) = [1 - 574.066/(T/K)] \times 10^4 \{0.822931 - 2.94554 \times 10^{-4} \cdot (T/K) + 2.19845 \times 10^{-7} \cdot (T/K)^2\}$; temp range: 325.0 – $645.0\ K$ (Cox eq., Chao et al. 1983)

0.446 (extrapolated, liquid, Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.88407 - 2570.55/(-46.989 + T/K)$; temp range 377 – $574\ K$ (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

6.197 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.23 (Leo et al. 1969)

2.25 (shake flask, Hansch & Leo 1979)

2.27 (shake flask-UV at pH 7.5, Martin-Villodre et al. 1986)

2.33 (HPLC- k' correlation, Minick et al. 1988)

2.25 (recommended, Sangster 1993)

2.25 (recommended, Hansch et al. 1995)

2.34 (microemulsion electrokinetic chromatography-retention factor correlation, Poole et al. 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

3.58, 3.43, 3.50	(Milford soil, Morocco soil, Oakville soil, Graveel et al. 1986)
2.63, 2.68, 3.15	(sediment, Alfisol soil, Podzol soil, von Oepen et al. 1991)
3.51, 3.48	(soil, quoted exptl., calculated-MCI χ , Meylan et al. 1992)
3.51	(soil, calculated-MCI χ , Sabljic et al. 1995)
2.0–2.65	(5 soils, pH 2.8–7.4, batch equilibrium-sorption isotherm, Li et al. 2000)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant $k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radical at 30°C in aquatic systems with $t_{1/2} = 0.8 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982);

rate constant $k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982);

atmospheric $t_{1/2} = 0.292\text{--}2.92 \text{ h}$, based on estimated rate constants for the reaction with OH radical in air and aqueous photooxidation $t_{1/2} = 62.4\text{--}3480 \text{ h}$, based on estimated rate constants for reaction of representative aromatic amines with OH and RO_2 radicals in aqueous solution (Howard et al. 1991);

photooxidation $t_{1/2} = 0.08\text{--}0.13 \text{ h}$ under sunlight and $t_{1/2} = 0.25\text{--}9.1 \text{ h}$ under UV light when adsorbed on silica; $t_{1/2} = 0.10\text{--}0.15 \text{ h}$ under sunlight and $t_{1/2} = 0.15\text{--}10.5 \text{ h}$ under UV light when adsorbed on alumina on the TLC plates under simulated atmospheric conditions (Hasegawa et al. 1993).

Hydrolysis:

Biodegradation: aqueous aerobic biodegradation $t_{1/2} = 672\text{--}4320 \text{ h}$ and aqueous anaerobic biodegradation $t_{1/2} = 2688\text{--}17280 \text{ h}$, based on slow biodegradation observed in aerobic soil die-away test study and aerobic activated sludge screening tests (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.292\text{--}2.92 \text{ h}$, based on estimated photooxidation half-life in air (Howard et al. 1991).

Surface water: $t_{1/2} = 0.62\text{--}3840 \text{ h}$, based on estimated rate constants for reactions of aromatic amines with OH and RO_2 radicals in aqueous solutions (Howard et al. 1991).

Groundwater: $t_{1/2} = 1344\text{--}8640 \text{ h}$, based on slow biodegradation observed in an aerobic soil die-away test study and aerobic activated sludge screening tests (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320 \text{ h}$, based on slow biodegradation observed in an aerobic soil die-away test study and aerobic activated sludge screening tests (Howard et al. 1991).

Biota:

16.1.3.16 β -Naphthylamine (2-Aminonaphthalene)

Common Name: 2-Naphthylamine

Synonym: 2-naphthalenamine, β -naphthylamine, 2-NA, 2-aminonaphthalene, naphthalidine

Chemical Name: 2-naphthalenamine

CAS Registry No: 91-59-8

Molecular Formula: $C_{10}H_7NH_2$

Molecular Weight: 143.185

Melting Point ($^{\circ}C$):

113 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

306.2 (Lide 2003)

Density (g/cm^3):

1.0614 (at $98^{\circ}C$, Weast 1982–83; Verschueren 1983; Dean 1985)

Molar Volume (cm^3/mol):

161.8 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

4.15 (Sangster 1993)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

21.97 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

57.32 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.137 (mp at $113^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

6.40 ($18^{\circ}C$, Ciusa 1922; quoted, Tsonopoulos & Prausnitz 1971)

0.19 (18 – $20^{\circ}C$, Neish 1948; quoted, Tsonopoulos & Prausnitz 1971)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.634 (extrapolated-regression of tabulated data, temp range 108 – $306.1^{\circ}C$, Stull 1947)

$\log(P/atm) = [-0.2185 \times 14679.6/(T/K)] + 8.435133$; temp range 108 – $306.1^{\circ}C$ (Antoine eq., Weast 1972–73)

0.369 (extrapolated-Cox eq., Chao et al. 1983)

$\log(P/atm) = [1 - 579.422/(T/K)] \times 10^{\{0.860256 - 4.44286 \times 10^{-4} \cdot (T/K) + 3.71453 \times 10^{-7} \cdot (T/K)^2\}}$; temp range: 385.0 – $645.0\ K$ (Cox eq., Chao et al. 1983)

0.035 (Howard et al. 1986)

0.035 (interpolated, solid, Antoine eq., Stephenson & Malanowski 1987)

0.362 (extrapolated, liquid, Antoine eq., Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 8.4859 - 3859/(T/K)$, temp range: 283 – $323\ K$, (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.88978 - 2604.31/(-46.068 + T/K)$, temp range 388 – $579\ K$ (Antoine eq.-II, Stephenson & Malanowski 1987)

0.340 (calculated-solvatochromic parameters, Banerjee et al. 1990)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.28 (shake flask, Hansch & Leo 1979)

2.26 ($20^{\circ}C$, shake flask, Korenman & Polumestnaya, 1982)

2.40 (calculated-UNIFAC activity coeff., Campbell & Luthy 1985)

2.40 (shake flask-AS, pH 7.5, Martin-Villodre et al. 1986)

2.34 (recommended, Sangster 1993)

2.28 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

1.77 (calculated- K_{OW} , Kollig 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant $k = 1 \times 10^4 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by RO_2 radicals at 30°C in aquatic systems with $t_{1/2} = 0.8 \text{ d}$ (Howard 1972; Hendry et al. 1974; quoted, Mill 1982);

rate constant $k < 2 \times 10^2 \text{ M}^{-1} \text{ s}^{-1}$ for oxidation by singlet oxygen at 25°C in aquatic systems with $t_{1/2} > 100 \text{ yr}$ (Foote 1976; Mill 1979; quoted, Mill 1982);

photooxidation $t_{1/2} = 0.30\text{--}2.90 \text{ h}$ in air, based on estimated rate constant for the vapor-phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

aqueous photooxidation $t_{1/2} = 62\text{--}3480 \text{ h}$, based on estimated rate constants for reaction of representative aromatic amines with OH and RO_2 radicals in aqueous solution (Güesten et al. 1981; Mill & Mabey 1985; quoted, Howard et al. 1991);

photooxidation $t_{1/2} = 0.05\text{--}0.14 \text{ h}$ under sunlight and $0.20\text{--}10.0 \text{ h}$ under UV light when adsorbed on silica and $t_{1/2} = 0.16\text{--}0.19 \text{ h}$ under sunlight and $t_{1/2} = 0.22\text{--}10.8 \text{ h}$ under UV light when adsorbed on alumina TLC plates under simulated atmospheric conditions (Hasegawa et al. 1993).

Hydrolysis:

Biodegradation: aqueous aerobic biodegradation $t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aerobic screening test data (Fochtman & Eisenberg 1979; quoted, Howard et al. 1979) and unacclimated soil grab sample data (Medvedev & Davidov 1981; quoted, Howard et al. 1991); aqueous anaerobic biodegradation $t_{1/2} = 2880\text{--}17280 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 0.30\text{--}2.90 \text{ h}$, based on estimated rate constant for the vapor-phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 62.0\text{--}3840 \text{ h}$, based on estimated rate constants for reactions of aromatic amines with OH and RO_2 radicals in aqueous solutions (Güesten et al. 1981; Mill & Mabey 1985; quoted, Howard et al. 1991).

Groundwater: $t_{1/2} = 1344\text{--}8640 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aerobic screening test data (Fochtman & Eisenberg 1979; quoted, Howard et al. 1991) and unacclimated aerobic soil grab sample data (Medvedev & Davidov 1981; quoted, Howard et al. 1981).

Biota:

16.1.3.17 2-Nitroaniline

Common Name: 2-Nitroaniline

Synonym: 1-amino-2-nitrobenzene, *o*-aminonitrobenzene, *o*-nitroaniline, 2-nitrophenylamine, 2-nitrobenzeneamine

Chemical Name: 1-amino-2-nitrobenzene, *o*-nitroaniline, 2-nitroaniline

CAS Registry No: 88-74-4

Molecular Formula: $C_6H_6N_2O_2$, $C_6H_4NH_2NO_2$

Molecular Weight: 138.124

Melting Point ($^{\circ}C$):

71.0 (Lide 2003)

Boiling Point ($^{\circ}C$):

284 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.442 ($15^{\circ}C$, Weast 1982–83; Verschueren 1983; Dean 1985)

Molar Volume (cm^3/mol):

138.7 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

16.11 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} (J/mol K):

46.86 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.354 (mp at $71.0^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

1212, 2423 ($25, 40^{\circ}C$, synthetic method-shake flask-titration, Collet & Johnson 1926)

1740 (calculated- K_{ow} , Yalkowsky & Morozowich 1980)

1260 (Verschueren 1983)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P/mmHg) = 8.81842 - 3336.52/(T/K)$; measured range 150 – $215^{\circ}C$ (isoteniscope, Berliner & May 1925)

$\log(P/mmHg) = 9.55950 - 4037.7/(T/K)$; measured range 190 – $250^{\circ}C$ (isoteniscope, Berliner & May 1925)

0.620 (extrapolated-regression of tabulated data, temp range 104 – $284.5^{\circ}C$, Stull 1947)

0.072 (Knudsen method, calculated-Antoine eq., Hoyer & Peperle 1958)

$\log(P/mmHg) = 12.50 - 4701/(T/K)$, temp range 0 – $50^{\circ}C$ (Knudsen effusion method, Hoyer & Peperle 1958)

$\log(P/mmHg) = [-0.2185 \times 15284.0/(T/K)] + 8.868383$; temp range 104 – $284.5^{\circ}C$ (Antoine eq., Weast 1972–73)

< 13.3 ($30^{\circ}C$, Verschueren 1983)

0.650 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 8.8684 - 3336.5/(T/K)$; temp range 150 – $260^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log(P_s/kPa) = 11.625 - 4701/(T/K)$; temp range 273 – 323 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 11.3629 - 7444.3/(240.83 + T/K)$; temp range 423 – 553 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P/mmHg) = -112.5774 - 1.5945 \times 10^3/(T/K) + 54.577 \cdot \log(T/K) - 7.6775 \times 10^{-2} \cdot (T/K) + 3.6152 \times 10^{-5} \cdot (T/K)^2$; temp range 345 – 558 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.44 (shake flask-UV, Fujita et al. 1964)

1.83 (shake flask-UV, Hansch & Anderson 1967)

1.62 (HPLC-RT correlation, Carlson et al. 1975)

1.81 (Hansch & Leo 1979)

- 1.72 (shake flask, Eadsforth & Moser 1983)
- 1.67 (calculated-HPLC- k' correlation, Deneer et al. 1987)
- 1.50 (calculated-linear extrapolation exptl. log k at various solvent compositions, Deneer et al. 1987)
- 1.93, 1.73 (25°C, 60°C, shake flask-UV, Kramer & Henze 1990)
- 1.85 (recommended, Sangster 1993)
- 1.80 \pm 0.14, 1.35 \pm 0.51 (solvent generated liquid-liquid chromatography SGLLC-correlation, RP-HPLC- k' correlation, Cichna et al. 1995)
- 1.85 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} :

Bioconcentration Factor, log BCF:

0.91; 1.49, 0.55, 0.83 (quoted exptl.; calculated values- K_{OW} , Bintein et al. 1993)

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Surface water: estimated $t_{1/2} = 1.4$ d in Rhine River in case of a first order reduction process (Zoeteman et al. 1980)

16.1.3.18 4-Nitroaniline

Common Name: 4-Nitroaniline

Synonym: 1-amino-4-nitrobenzene, *p*-aminonitrobenzene, *p*-nitroaniline, 4-nitrobenzenamine, 4-nitrophenylamine

Chemical Name: 1-amino-4-nitrobenzene, *p*-nitroaniline, 4-nitroaniline

CAS Registry No: 100-01-6

Molecular Formula: $C_6H_6N_2O_2$, $C_6H_4NH_2NO_2$

Molecular Weight: 138.124

Melting Point ($^{\circ}C$):

147.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

332 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.424 (Weast 1982–83; Verschueren 1983)

1.4370 ($14^{\circ}C$, Dean 1985)

Molar Volume (cm^3/mol):

138.7 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

21.09 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

50.21 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.0628 (mp at $147.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

568, 1157 ($25, 40^{\circ}C$, synthetic method-shake flask-titration, Collet & Johnson 1926)

728 ($30^{\circ}C$, shake flask-interferometry, Gross et al. 1931)

603 (calculated- K_{ow} , Yalkowsky & Morozowich 1980)

380 ($20^{\circ}C$, shake flask-membrane filter-fluorophotometry, Hashimoto et al. 1982)

390, 400 ($20^{\circ}C$, shake flask-glass fiber filters-fluorophotometry, Hashimoto et al. 1982)

800; 22000 ($19^{\circ}C, 100^{\circ}C$, Verschueren 1983)

800 (Dean 1985)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P/mmHg) = 9.55950 - 4037.7/(T/K)$; measured range 190 – $250^{\circ}C$ (isoteniscope, Berliner & May 1925)

0.035 (extrapolated-regression of tabulated data, temp range 142.4 – $336^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 13.69 - 5707/(T/K)$, temp range 30 – $90^{\circ}C$, (Knudsen effusion method, Hoyer & Peperle 1958)

$\log(P/mmHg) = [-0.2185 \times 17220.2/(T/K)] + 9.041879$; temp range 142.4 – $336^{\circ}C$ (Antoine eq., Weast 1972–73)

0.200, 0.933 ($20^{\circ}C, 30^{\circ}C$, Verschueren 1983)

0.014 (extrapolated-Antoine eq., Dean 1985)

$\log(P/mmHg) = 9.5595 - 4039.73/(T/K)$; temp range 190 – $260^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log(P_s/kPa) = 11.1109 - 5093/(T/K)$; temp range 346 – $366\ K$ (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 8.7988 - 4071.3/(T/K)$; temp range 473 – $538\ K$ (liquid, Antoine eq.-II., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 56.1642 - 5.3655 \times 10^3/(T/K) - 17.958 \cdot \log(T/K) + 9.092 \times 10^{-3} \cdot (T/K) + 7.0305 \times 10^{-10} \cdot (T/K)^2$; temp range 421 – $609\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$):

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 1.39 (shake flask-UV, Fujita et al. 1964; Hansch & Leo 1979)
- 0.59 (calculated-activity coeff. γ from UNIFAC, Campbell & Luthy 1985)
- 1.16 (HPLC- k' correlation, Deneer et al. 1987)
- 1.10 (calculated-linear extrapolation exptl. values of $\log k$ at various solvent compositions, Deneer et al. 1987)
- 1.15 (HPLC-RT correlation, Wang et al. 1989)
- 1.51, 1.36 (25°C , 60°C , shake flask-UV, Kramer & Henze 1990)
- 1.30 (CPC-RV correlation, Tsai et al. 1991)
- 1.30 (CPC-RV correlation, El Tayar et al. 1991)
- 1.35 (recommended, Sangster 1993)
- 1.39 ± 0.14 , 0.75 ± 0.48 (solvent generated liquid-liquid chromatography SGLLC-correlation, RP-HPLC- k' correlation, Cichna et al. 1995)
- 1.37 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 2.26; 2.66; 2.12 (Alfisol soil; Podzol soil; sediment, von Oepen et al. 1991)
- 0.64; 1.25, -0.18 , 0.41 (quoted exptl.; calculated values- K_{OW} , Bintein et al. 1993)
- 2.16, 2.22, 2.19 (RP-HPLC- k' correlation on 3 different stationary phases, Szabo et al. 1995)
- 1.86, 1.84 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

- Surface water: estimated $t_{1/2} = 2.3$ d in Rhine River in case of a first order reduction process (Zoeteman et al. 1980)

16.1.4 NITROAROMATIC COMPOUNDS

16.1.4.1 Nitrobenzene

Common Name: Nitrobenzene

Synonym: nitrobenzol, oil of mirbane

Chemical Name: nitrobenzene

CAS Registry No: 98-95-3

Molecular Formula: $C_6H_5NO_2$

Molecular Weight: 123.110

Melting Point ($^{\circ}C$):

5.7 (Stull 1947; Dreisbach 1955; Weast 1982–83; Howard 1989; Lide 2003)

Boiling Point ($^{\circ}C$):

210.8 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.2032, 1.1982 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955)

1.2036 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

102.0 (calculated from density, Rohrschneider 1973; Chiou 1985)

112.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

Enthalpy of Vaporization, ΔH_v (kJ/mol):

55.186, 43.421 ($25^{\circ}C$, bp, Dreisbach 1961)

55.013, 40.769 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.59 (Dreisbach 1955)

12.13 (Tsonopoulos & Prausnitz 1971)

11.63 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

43.51 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

1780, 2050 (15, $30^{\circ}C$, shake flask-interferometry, Gross et al. 1931)

2060* ($30^{\circ}C$, shake flask-interferometry and titration, measured range 0 – $60^{\circ}C$, Vermillion et al. 1941)

1204 (shake flask-centrifuge, Booth & Everson 1948)

1930 (Seidell 1941)

2018 (shake flask-interferometry, Donahue & Bartell 1952)

1950 (Deno & Berkheimer 1960)

2259 ($35^{\circ}C$, shake flask-UV spectrophotometry, Hine et al. 1963)

2060 (Hansch et al. 1968)

1900 ($20^{\circ}C$, Verschueren 1977, 1983)

2093 (shake flask-LSC, Banerjee et al. 1980)

2090 (shake flask-radioactive analysis, Veith et al. 1980)

2043 (20 – $27^{\circ}C$, shake flask-GC, Chiou 1985)

1900 ($20^{\circ}C$, Riddick et al. 1986; quoted, Howard 1989)

1930* ($20^{\circ}C$, shake flask-UV spectrophotometry, measured range 10 – $40^{\circ}C$, Beneš & Dohnal 1999)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 133.3* (53.1°C, static-manometer, measured range 53.1–208.3°C, Kahlbaum 1898)
 38.80 (saturated vapor density-gas saturation, Puck & Wise 1946)
 42.06* (extrapolated-regression of tabulated data, temp range 44.4–210.6°C, Stull 1947)
 10063* (134.1°C, ebulliometry, measured range 134.1–210.629°C, Brown 1952)
 37.86 (calculated by formula, Dreisbach 1955; quoted, Hine & Mookerjee 1975)
 $\log(P/\text{mmHg}) = 7.08283 - 1722.2/(199.0 + t/^\circ\text{C})$; temp range 108–300°C (Antoine eq. for liquid state, Dreisbach 1955)
 32.3* (23.14°C, gas saturation, measured range 6.09–23.14°C, Lynch & Wilke 1960)
 $\log(P/\text{mmHg}) = 7.545 - 2064/(t/^\circ\text{C} + 230)$; temp range 6.09–23.14°C (gas saturation, Lynch & Wilke 1960)
 80.0 (35°C, gas saturation-gravitational or UV spectrophotometry, Hine et al. 1963)
 $\log(P/\text{mmHg}) = [-0.2185 \times 12168.2/(T/\text{K})] + 8.416268$; temp range 44.4–210.6°C (Antoine eq., Weast 1972–73)
 34.60 (extrapolated-Antoine eq., Boublik et al. 1973)
 $\log(P/\text{mmHg}) = 7.11562 - 1746.585/(201.783 + t/^\circ\text{C})$, temp range 134–210.6°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 20.00 (20°C, Verschueren 1977, 1983)
 28.37 (calculated-bp, Mackay et al. 1982)
 34.36 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.23424 - 1741.779/(201.257 + t/^\circ\text{C})$; temp range 134–210.6°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 4.06596 - 323.457/(-58.276 + t/^\circ\text{C})$; temp range 239–291°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 34.63 (extrapolated-Antoine eq., Dean 1985; 1992)
 $\log(P/\text{mmHg}) = 6.91048 - 946.35/(246.68 + t/^\circ\text{C})$; temp range –87 to 7°C (Antoine eq., Dean 1985, 1992)
 37.0 (quoted lit., Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.670 - 2064.0/(230.0 + t/^\circ\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 37.65 (extrapolated-Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.22069 - 1732.222/(-72.886 + T/\text{K})$; temp range 407–484 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.6699 - 2064/(-43.15 + T/\text{K})$; temp range 279–296 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 33.33 (Howard et al. 1986)
 $\log(P/\text{mmHg}) = -54.4937 - 2.1123 \times 10^3/(T/\text{K}) + 29.321 \cdot \log(T/\text{K}) - 4.4839 \times 10^{-2} \cdot (T/\text{K}) + 2.0162 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 279–719 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa·m³/mol at 25°C):

- 2.367, 4.51, 4.723 (exptl., calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
 1.327 (calculated-P/C, Mabey et al. 1982)
 2.472 (estimated, Lyman et al. 1982)
 5.06 (calculated-molecular structure, Russell et al. 1992)
 0.868 (gas stripping-GC, Altschuh et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 1.85 (shake flask-UV, Fujita et al. 1964; Hansch et al. 1968; Leo et al. 1969, 1971; Hansch & Leo 1979, 1985;)
 1.74 (Neely et al. 1974)
 1.85, 1.84 (Hansch & Leo 1979)
 1.82 (HPLC-RT correlation, Veith et al. 1979a)
 1.83 (shake flask-LSC, Banerjee et al. 1980)
 1.98, 1.78 (HPLC-k' correlation, McDuffie 1981)
 1.85 (generator column-HPLC, Wasik et al. 1981; Tewari et al. 1982;)
 1.88 (shake flask-UV, Unger & Chiang 1981)
 1.99 (RP-HPLC-k' correlation, Miyake & Terada 1982)
 1.83, 1.84 (calculated-activity coeff. γ from UNIFAC, octanol and water solubility considered; calculated-activity coeff. γ from UNIFAC, octanol and water solubility not considered, Arbuckle 1983)
 1.85, 1.88 (lit. values, Verschueren 1983)

- 1.83 ± 0.02 (HPLC-RV correlation-ALPM, Garst & Wilson 1984)
- 1.84 (calculated-activity coefficient γ from UNIFAC, Campbell & Luthy 1985)
- 1.87 (Lu et al. 1986)
- 1.85 (RP-HPLC- k' correlation, Minick et al. 1988)
- 1.89 (HPLC- k' correlation, Deneer et al. 1987)
- 1.84 (calculated-activity coeff. γ from UNIFAC, Banerjee & Howard 1988)
- 1.70 (RP-HPLC-RT correlation, ODS column with masking agent, Bechalany et al. 1989)
- 1.828 ± 0.001 (shake flask/slow-stirring-GC, De Bruijn et al. 1989)
- 1.85 (recommended, Sangster 1989, 1993)
- 1.836 ± 0.051; 1.828 ± 0.001 (average values, stir-flask method by BRE; by RITOX, Brooke et al. 1990)
- 1.83, 1.85, 1.88 (CPC-retention volume correlation; Gluck & Martin 1990)
- 1.94, 2.25 (25°C, 60°C, shake flask-UV, Kramer & Henze 1990)
- 1.57 (shake flask-UV, Nakagawa et al. 1992)
- 1.85 (shake flask-GC, Alcron et al. 1993)
- 1.85 (recommended, Hansch et al. 1995)
- 2.25, 2.12, 2.20, 2.23 (HPLC- k' correlation, different combinations of stationary and mobile phases under isocratic conditions, Makovskaya et al. 1995)
- 1.88 (shake flask-dialysis tubing-HPLC/UV, both phases, Andersson & Schröder 1999)
- 1.93 (microemulsion electrokinetic chromatography-retention factor correlation, Poole et al. 2000)

Octanol/Air Partition Coefficient, log K_{OA} :

Bioconcentration Factor, log BCF:

- 1.18 (fathead minnows, Veith et al. 1979b)
- 0.06 (calculated- K_{OW} , Veith et al. 1980)
- < 1.0; 1.36 (golden orfe; green algae, Freitag et al. 1982)
- 1.38; 1.42 (alga *Chlorella fusca*, wet wt. basis; calculated- K_{OW} , Geyer et al. 1984)
- 0.78 (*P. reticulata*, Canton et al. 1985; quoted, Howard 1989)
- < 1.0, 1.38, 1.60 (golden orfe, algae, activated sludge, Freitag et al. 1982)
- < 1.0, 1.30, 1.60 (golden ide, algae, activated sludge, Freitag et al. 1985)
- 1.47 ± 0.12 (guppy-fat wt. basis, Deneer et al. 1987)

Sorption Partition Coefficient, log K_{OC} :

- 1.94 (20°C, sorption isotherm-GC, converted from K_{OM} multiplied by 1.724, Briggs 1981)
- 2.30 (Lincoln fine sand, calculated exptl. value, Wilson et al. 1981)
- 2.23, 2.57 (Danish subsoils, Loekke 1985)
- 1.63, 1.84 (two Norwegian organic soils, Seip et al. 1986)
- 1.70 (soil, quoted, Sabljic 1987)
- 1.95 ± 0.84, 2.02 ± 1.18; 1.99 (Captina slit loam, McLaurin sandy loam; weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)
- 1.43 (predicted- K_{OW} , Walton et al. 1992)
- 1.51 (calculated- K_{OW} , Kolliq 1993)
- 2.20 (soil, calculated-QSAR MCI $^1\chi$, Sabljic et al. 1995)
- 2.05, 2.16, 2.15 (RP-HPLC- k' correlation on 3 different stationary phases, Szabo et al. 1995)
- 1.99, 1.84 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)
- 2.20; 2.28 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1996)
- 2.51, 2.03, 2.26, 2.09, 1.90 (soil: calculated- K_{OW} ; HPLC-screening method using LC-columns of different stationary phases, Szabo et al. 1999)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

- Volatilization: $t_{1/2}(\text{calc}) \approx 200$ h from water bodies (Mackay & Leinonen 1975; quoted, Callahan et al. 1979)
- $t_{1/2} = 45$ d was estimated in a model river 1 m deep with a 1.0 m/s current and a 3 m/s wind (Lyman et al. 1982; quoted, Howard 1989).

Photolysis: aqueous photolysis $t_{1/2} = 67\text{--}200$ d, based on measured photolysis rate constant in distilled water under midday sun at 40°N latitude (Simmons & Zepp 1986; Howard 1989; Howard et al. 1991); atmospheric photolysis $t_{1/2} = 67\text{--}200$ d, based on measured photolysis rate constant in distilled water under midday sun at 40°N latitude (Simmons & Zepp 1986; quoted, Howard 1989; Howard et al. 1991); rate constant $k = 2.37 \times 10^{-3} \text{ h}^{-1}$ with H_2O_2 under photolysis at 25°C in F-113 solution and with $\text{HO}\cdot$ in the gas (Dilling et al. 1988).

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated *data at other temperatures see reference:

photooxidation $t_{1/2} = 125$ d to 22 yr in water, based on measured rate constant for reaction with hydroxyl radical in water (Dorfman & Adams 1973; Anbar & Neta 1967; quoted, Howard et al. 1991)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen, $k \ll 1.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

$k = (0.09 \pm 0.02) \text{ M}^{-1} \text{ s}^{-1}$ for 5–10 mM to react with ozone in water using 50–1000 mM of *t*-BuOH as scavenger at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{\text{OH}}(\text{obs.}) = 0.15 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (Becker et al. 1984; quoted, Carlier et al. 1986)

$k_{\text{OH}} = 0.21 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Zetzsch 1982)

$k_{\text{OH}}(\text{calc}) = 0.30 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $0.27 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985; Atkinson et al. 1985)

$k_{\text{OH}}^* = 0.137 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 299 K, measured range 259–362 K (flash photolysis-resonance fluorescence, Witte et al. 1986)

$k_{\text{OH}}(\text{calc}) = 1.1 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $1.7 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (addition of OH for different positions of the electrophilic attack, Witte et al. 1986)

$k_{\text{O}_3} < 7 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K (relative rate method, Atkinson et al. 1987)

$k_{\text{OH}} = 1.3 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with atmospheric lifetimes $\tau = 180$ d in clean troposphere and 90 d in moderately polluted atmosphere; $k_{\text{O}_3} < 7 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with atmospheric lifetimes $\tau > 6$ yr in clean troposphere and $\tau > 2$ yr in moderately polluted atmosphere at room temp. (Atkinson et al. 1987)

$k_{\text{OH}}(\text{calc}) = 2.5 \times 10^{-13} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.4 \times 10^{-13} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}} = (0.16 - < 0.90) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (review, Atkinson 1989)

phototransformation decay rate constant of 0.17 min^{-1} on 0.20 g/L of TiO_2 , 8.8 min^{-1} on 0.20 g/L of ZnO and 3.1 min^{-1} on 1.0 g/L of Al_2O_3 (Minero et al. 1994)

Abiotic Transformation: Degradation in reductive environment:

$k = 0.187 \text{ min}^{-1}$ with solute concn of 50 μM in a 19 day-old 0.2g/L magnetite suspension at pH 7 and 1.5 mM Fe(II) at 25°C (Klusen et al. 1995)

$k = (7.39 \pm 1.28) \times 10^{-2} \text{ M}^{-1} \text{ s}^{-1}$ in H_2S with (mercapto)juglone (an abiotic reductant found in natural systems) solution at pH 6.65 (Wang & Arnold 2003)

Biodegradation:

decomposition by a soil microflora in more than 64 d (Alexander & Lustigman 1966; quoted, Verschuere 1983)

$t_{1/2}(\text{aq. anaerobic}) = 48\text{--}300$ h, based on anaerobic natural die-away test data for 2,4-dinitrotoluene (Spanggard et al. 1980; quoted, Howard et al. 1991)

$k = 14 \text{ mg COD g}^{-1} \text{ h}^{-1}$ average biodegradation rate for 98% removal (Scow 1982)

$t_{1/2}(\text{aq. aerobic}) = 322\text{--}4728$ h, based on aerobic soil column biodegradation study data (Kincannon & Lin 1985; quoted, Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 13$ d, $t_{1/2}(\text{anaerobic}) = 2$ d in natural waters (Capel & Larson 1995)

Biotransformation: first-order rate constant of 0.7 d^{-1} corresponding to a half-life of 1 d in adopted activated sludge under aerobic conditions (Mills et al. 1982); rate constant for bacterial transformation of $3 \times 10^{-9} \text{ mL cell}^{-1} \text{ h}^{-1}$ in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric lifetimes: $\tau = 180$ d in clean troposphere and $\tau = 90$ d in moderately polluted atmosphere, based on gas-phase reaction with OH radical in atmosphere at room temp. and atmospheric lifetimes $\tau > 6$ yr in clean troposphere and $\tau > 2$ yr in moderately polluted atmosphere, based on gas-phase reaction with O_3 (estimated rate constant) in atmosphere at room temp. (Atkinson et al. 1987);

photooxidation $t_{1/2} = 0.544 - 5.44$ h, based on measured rate constant for reaction with hydroxyl radical in air (Atkinson et al. 1987; quoted, Howard 1989; Howard et al. 1991);

atmospheric transformation lifetime was estimated to be > 5 d (Kelly et al. 1994).

Surface water: photooxidation $t_{1/2} = 125$ d to 22 yr, based on measured rate constant for reaction with hydroxyl radical in water (Dorfman & Adams 1973; Anbar & Neta 1967; quoted, Howard et al. 1991);

estimated $t_{1/2} = 0.3 - 3.0$ d in rivers (Zoeteman et al. 1980);

$t_{1/2} = 322 - 4728$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 13$ d, $t_{1/2}(\text{anaerobic}) = 2$ d in natural waters (Capel & Larson 1995).

Groundwater: estimated $t_{1/2} = 1.0$ d in Rhine River in case of a first order reduction process (Zoeteman et al. 1980)

$t_{1/2} = 48 - 9456$ h, based on estimated unacclimated aqueous anaerobic biodegradation half-life for 2,4-dinitrotoluene and estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: estimated degradation $t_{1/2} = 625$ d in activated sludge (Freitag et al. 1985; quoted, Anderson et al. 1991)

$t_{1/2} = 322 - 4728$ h, based on aerobic soil column biodegradation study data (Kincannon & Lin 1985; quoted, Howard et al. 1991);

calculated $t_{1/2} = 9.1$ d from first-order kinetic of degradation rate in sterilized soils (Anderson et al. 1991).

Biota:

FIGURE 16.1.4.1.2 Logarithm of vapor pressure versus reciprocal temperature for nitrobenzene.

16.1.4.2 2-Nitrotoluene

Common Name: 2-Nitrotoluene

Synonym: 1-methyl-2-nitrobenzene, *o*-nitrotoluene, 2-methylnitrobenzene

Chemical Name: 2-nitrotoluene, *o*-nitrotoluene

CAS Registry No: 88-72-2

Molecular Formula: $C_7H_7NO_2$, $CH_3C_6H_4NO_2$

Molecular Weight: 137.137

Melting Point ($^{\circ}C$):

−10.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

222 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.15693, 1.15232 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach & Martin 1949)

1.1629 (Weast 1982–83)

Molar Volume (cm^3/mol):

117.9 ($20^{\circ}C$, Stephenson & Malanowski 1987)

153.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$. Additional data at other temperatures designated * are compiled at the end of this section):

652 ($30^{\circ}C$, shake flask-interferometer, Gross et al. 1933)

656 (quoted, Deno & Berkheimer 1960)

< 233 (shake flask-centrifuge, Booth & Everson 1948)

324 (Hansch et al. 1968)

656, 2076 (quoted, predicted- K_{ow} , Valvani et al. 1981)

652 ($30^{\circ}C$, Verschueren 1983)

656, 771 (quoted, calculated-fragment const., Wakita et al. 1986)

641; 444 (quoted exptl.; calculated-group contribution method, Kühne et al. 1995)

609* ($20^{\circ}C$, shake flask-UV spectrophotometry, measured range 10 – $40^{\circ}C$, Beneš & Dohnal 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

23.97* (extrapolated-regression of tabulated data, Kahlbaum 1898)

27.69* (extrapolated-regression of tabulated data, temp range 50 – $222.3^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.49454 - 2086.1/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

3640* ($115.842^{\circ}C$, ebulliometry, measured range 115.842 – $174.744^{\circ}C$, Dreisbach & Shrader 1949)

$\log(P/mmHg) = [-0.2185 \times 12239.7/(T/K)] + 8.286642$; temp range 50 – $222.3^{\circ}C$ (Antoine eq., Weast 1972–73)

13.33 ($20^{\circ}C$, Verschueren 1983)

1.670 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 5.01415 - 967.744/(99.208 + t/^{\circ}C)$; temp range 129.31 – $222.2^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

1.440 (extrapolated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 5.851 - 946/(96 + t/^{\circ}C)$, temp range 129 – $222^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log(P_L/kPa) = 6.32043 - 1827.66/(-71.63 + T/K)$; temp range 402 – 496 K (Antoine eq., Stephenson & Malanowski 1987)

24.80* (ebulliometry, average from extrapolated-Antoine eq., Aim 1994)

$\log(P/\text{mmHg}) = 7.8266 - 2.9906 \times 10^3/(T/K) + 1.1064 \cdot \log(T/K) - 4.9168 \times 10^{-3} \cdot (T/K) + 2.2375 \times 10^{-6} \cdot (T/K)^2$;
temp range 270–720 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

5.811 (exptl., Hine & Mookerjee 1975)

4.723, 4.616 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.30 (Leo et al. 1971; Hansch & Leo 1985)

2.30 (HPLC- k' correlation, Deneer et al. 1987)

2.30 (unpublished data quoted from CLOGP Database and recommended, Sangster 1989)

2.39, 2.43, 2.58 (CPC-RV correlation, Gluck & Martin 1990)

2.46, 2.60; 2.30 (25°C , 60°C , shake flask-UV; quoted lit. value, Kramer & Henze 1990)

2.13 (shake flask-UV, Nakagawa et al. 1992)

2.30 (recommended, Sangster 1993)

2.40 ± 0.15 , 2.21 ± 0.53 (solvent generated liquid-liquid chromatography SGLLC-correlation, RP-HPLC- k' correlation, Cichna et al. 1995)

2.30 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

< 2.0 (*carpinus carpio*, Sasaki 1978; Kawasaki 1980)

1.52, 1.20 (calculated- K_{OW} , S, Lyman et al. 1982; quoted, Howard 1989)

2.28 ± 0.06 (guppy-fat basis, Deneer et al. 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

2.63, 2.09 (soil, calculated- K_{OW} , S, Lyman et al. 1982; quoted, Howard 1989)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} = 21$ h using Henry's law constant for a model river 1-m deep flowing 1 m/s with a wind speed of 3 m/s (Lyman et al. 1982; quoted, Howard 1989).

Photolysis:

Oxidation: rate constant $k = 3.0 \times 10^{-11} \text{ cm}^3 \text{ molecules}^{-1} \text{ s}^{-1}$ for the reaction with $8 \times 10^{-5} \text{ molecules/cm}^3$ photochemically produced hydroxyl radical in air (GEMS 1986; quoted, Howard 1989); rate constant $k = 7.0 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the gas-phase reactions with OH radical at 298 K (Atkinson 1989).

Hydrolysis:

Abiotic Transformation: Degradation in reductive environment:

$k = 0.141 \text{ min}^{-1}$ with solute concn of $50 \mu\text{M}$ in a 19 day-old 0.2g/L magnetite suspension at pH 7 and 1.5 mM Fe(II) at 25°C (Klusen et al. 1995)

Biodegradation: average biodegradation rate of $32.5 \text{ mg COD g}^{-1} \text{ h}^{-1}$ for 98% removal (Scow 1982).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 8$ h, based on a rate constant $k = 3.0 \times 10^{-11} \text{ cm}^3 \text{ molecules}^{-1} \text{ s}^{-1}$ for the reaction with $8 \times 10^{-5} \text{ molecules/cm}^3$ photochemically produced hydroxyl radical in air (GEMS 1986; quoted, Howard 1989).

Surface water: estimated $t_{1/2} = 3.2$ d in Rhine River in case of a first order reduction process (Zoeteman et al. 1980)
midday $t_{1/2}(\text{calc}) = 45$ min in Aucilla River water due to indirect photolysis using an experimentally determined reaction rate constant $k = 0.92 \text{ h}^{-1}$ (Zepp et al. 1984; quoted, Howard 1989);

estimated $t_{1/2} = 3.2$ d for a river 4 to 5 m deep, based on monitoring data (Zoeteman et al. 1980; quoted, Howard 1989).

FIGURE 16.1.4.2.2 Logarithm of vapor pressure versus reciprocal temperature for 2-nitrotoluene.

16.1.4.3 4-Nitrotoluene

Common Name: 4-Nitrotoluene

Synonym: 1-methyl-4-nitrobenzene, *p*-nitrotoluene, 4-methylnitrobenzene

Chemical Name: 4-nitrotoluene, *p*-nitrotoluene

CAS Registry No: 99-99-0

Molecular Formula: $\text{CH}_3\text{C}_6\text{H}_4\text{NO}_2$

Molecular Weight: 137.137

Melting Point ($^{\circ}\text{C}$):

51.63 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

238.3 (Stull 1947; Weast 1982–83; Dean 1985; Howard 1989)

Density (g/cm^3 at 20°C):

1.16278, 1.15799 (20°C , 25°C , Dreisbach & Martin 1949)

1.392 (Dean 1985)

Molar Volume (cm^3/mol):

124.2 (75°C , Stephenson & Malanowski 1987)

153.0 (calculated-Le Bas method at normal boiling point)

Dissociation Constant, pK :

–11.27 (Perrin 1972)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.15 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

50.21 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F : 0.548 (mp at 51.63°C)

Water Solubility (g/m^3 or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

442 (30°C , shake flask-interferometer, Gross et al. 1933)

< 278 (shake flask-centrifuge, Booth & Everson 1948)

302 (Tsonopoulos & Prausnitz 1971)

442 (30°C , Verschueren 1983)

288 (20°C , shake flask-UV spectrophotometry, Hashimoto et al. 1984)

307 (calculated-group contribution method, Kühne et al. 1995)

242* (20°C , shake flask-UV spectrophotometry, measured range $10\text{--}40^{\circ}\text{C}$, Beneš & Dohnal 1999)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

13.98* (extrapolated-regression of tabulated data, measured range $92\text{--}237^{\circ}\text{C}$, Kahlbaum 1898)

$\log (P/\text{mmHg}) = -2630/(T/\text{K}) + 8.025$ (isoteniscopes method, temp range not specified, Kobe et al. 1941)

22.81* (extrapolated-regression of tabulated data, temp range $53.7\text{--}238.2^{\circ}\text{C}$, Stull 1947)

$\log (P/\text{mmHg}) = 7.52323 - 2150.6/(230 + t/^{\circ}\text{C})$ (Antoine eq., Dreisbach & Martin 1949)

8851* (147.71°C , ebulliometry, measured range $147.71\text{--}233.25^{\circ}\text{C}$, Dreisbach & Shrader 1949)

0.622* (23.886°C , Knudsen effusion, measured range $297.036\text{--}309.518 \text{ K}$, Lenchitz & Velicky 1970)

$\log (P/\text{mmHg}) = 11.5424 - 4130.0708/(T/\text{K})$; temp range $297\text{--}310 \text{ K}$ (Knudsen effusion, Lenchitz & Velicky 1970)

$\log (P/\text{mmHg}) = [-0.2185 \times 11915.0/(T/\text{K})] + 7.965025$; temp range $53.7\text{--}238.3^{\circ}\text{C}$ (Antoine eq., Weast 1972–73)

5.50* (ebulliometry, fitted to Antoine eq., measured range $144\text{--}239^{\circ}\text{C}$, Ambrose & Gundry 1980)

9.50 (extrapolated-supercooled liq., Ambrose & Gundry 1980)

- 13.33 (20°C, Verschueren 1983; quoted, Howard 1989)
 8.347 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.11507 - 1716.897/(184.543 + t/^\circ\text{C})$; temp range 147.7–233.3°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 8.38 (extrapolated-Antoine eq., Dean 1985, 1992)
 $\log(P/\text{mmHg}) = 6.9948 - 1720.39/(184.9 + t/^\circ\text{C})$; temp range 148–233°C (Antoine eq., Dean 1985, 1992)
 0.653 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_g/\text{kPa}) = 10.6673 - 4130.07/(T/\text{K})$; temp range 296–310 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 7.40605 - 2889.12/(23.37 + T/\text{K})$; temp range 423–512 K (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)
 15.18* (ebulliometry, average of extrapolated-Antoine eq., Aim 1994)
 $\log(P/\text{mmHg}) = 9.9641 - 2.6549 \times 10^3/(T/\text{K}) - 0.80182 \cdot \log(T/\text{K}) + 5.3926 \times 10^{-4} \cdot (T/\text{K}) - 4.109 \times 10^{-14} \cdot (T/\text{K})^2$;
 temp range 325–736 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

- 5.065 (calculated, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 2.37 (shake flask-UV, Fujita et al. 1964)
 2.40 (unpublished result, Leo et al. 1971)
 2.34 (HPLC- k' correlation, Deneer et al. 1987)
 2.42 (recommended, Sangster 1989)
 2.10, 2.05 (25°C, 60°C, shake flask-UV, Kramer & Henze 1990)
 2.61 (shake flask-UV, Nakagawa et al. 1992)
 2.37 (recommended, Sangster 1993)
 2.37 ± 0.15 (solvent generated liquid-liquid chromatography SGLLC-correlation, Cichna et al. 1995)
 2.42 (recommended, Hansch et al. 1995)
 2.18 (microemulsion electrokinetic chromatography-retention factor correlation, Poole et al. 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

- < 2.0 (*Carprinus carpio*, Sasaki 1978; Kawasaki 1980)
 1.57, 1.30 (calculated- K_{ow} , S, Lyman et al. 1982; quoted, Howard 1989)
 2.37 ± 0.05 (guppy-fat basis, Deneer et al. 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.67, 2.18 (soil, calculated- K_{ow} , S, Lyman et al. 1982; quoted, Howard 1989)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: based on Henry's law constant an estimated $t_{1/2} = 25$ h was obtained for a model river of 1- m deep with a current of 1 m/s and wind speed of 3 m/s (Lyman et al. 1982; quoted, Howard 1989).

Photolysis:

Oxidation: photooxidation $t_{1/2} = 8.0$ h in air, based on measured rate constant $k = 3 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 25°C for the reaction with photochemically produced $8 \times 10^5 \text{ molecules/cm}^3$ hydroxyl radical (GEMS 1986; quoted, Howard 1989).

Hydrolysis:

Abiotic Transformation: Degradation in reductive environment:

$k = 0.101 \text{ min}^{-1}$ with solute concn of 50 μM in a 19 d-old 0.2g/L magnetite suspension at pH 7 and 1.5 mM Fe(II) at 25°C (Klusen et al. 1995)

Biodegradation: average biodegradation rate of 32.5 mg COD $\text{g}^{-1} \text{ h}^{-1}$ for 98% removal (Scow 1982).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photooxidation $t_{1/2} = 8.0$ h, based on measured rate constant of 3×10^{-11} cm³ molecule⁻¹ s⁻¹ at 25°C for the reaction with photochemically produced 8×10^5 molecules/cm³ hydroxyl radical (GEMS 1986; quoted, Howard 1989).

Surface water: estimated $t_{1/2} = 2.7$ d in Rhine River in case of a first order reduction process (Zoeteman et al. 1980) estimated $t_{1/2} = 2.7$ d, based on monitoring data for a river of 4 to 5-m deep (Zoeteman et al. 1980; quoted, Howard 1989).
